Meet Mr. Money Mustache

By Mr. Money Mustache

Wed, 06 Apr 2011 19:49:37 +0000

"What do you mean you retired at 30?"

This is a blog about money. We're going to cover a lot of ground and make plenty of amusing side trips into lifestyle and culture issues, but when it boils down to it, we are talking about money, and the freedom it can give you. Freedom from worry, and freedom from most forms of bullshit. And the best way to illustrate such freedom is to have an opinionated but wise role model guide you through your daily life from this point onwards. That role model is ME, Mr. Money Mustache.

I'm going to teach you a radical new way to think about and enjoy money that will get you off of your current debt-powered treadmill and into a lifestyle that is completely unimaginable to most people where I live, which happens to be in the United States, ground zero for self-imposed treadmills.

Once you are off the mill, you'll feel like Neo did when he unplugged the suction cups from his pale naked body in The Matrix and looked around at the other imprisoned humans. "Holy Shit!", you will say. "I've been living in this ridiculous slave world and never noticed.. and everyone else still is! ***WAKE UP DRONE PEOPLE!!!***".

You will suddenly be able to fly freely through the world, free from having to work for a living, able to start living life as you choose, doing exotic things like spending time raising your young children, taking a 3-week vacation each month, or just enjoying understated shows of leisure like sweeping your driveway in pajamas at 11am on a sunny Thursday morning.

Let's talk about YOU first. If you are one of the 99% of working people I hear and read about every day, you are in a bad place right now. Young folks today seem to live somewhere on a Spectrum of Financial Idiocy.

" I am…

1. Retired, and my money situation is perfect
2. Still working, saving max in 401k, no loans on cars or credit cards, paying regular mortgage payments
3. Same as above but add one or more **car loans**
4. Same as above but **not quite able to max out 401k plans** due to life's little expenses
5. Same as above but have a few **credit cards** that I'm making payments on
6. **Can't always make all my payments**, got some bad marks on my credit score.. I'd be screwed if I lose my job now
7. Everything has collapsed – losing my house and possessions, can't find work, debt is more than I can pay off in a lifetime, **why is the world so cruel to me!?**

So your goal is to move up this spectrum. Everyone can do it. But most people think they can't because they're still stuck in the Matrix.

They blame "the economy" or other bullshit external factors, when really the only problem is they aren't listening hard enough to Mr. Money Mustache. Become a regular reader of this blog and you'll move up fast.

See you at #1.

Meet the Realist

By Mr. Money Mustache

Thu, 07 Apr 2011 16:09:18 +0000

Whoa, did you read that opinionated garbage yesterday?

Who is this Mr. Money Mustache? The guy thinks he's got it all figured out. And is he trying to offer financial advice, or just financial *scorn* to those less fortunate than himself? Sure, maybe you can retire early if you are born to a frugal family, get a good education and never make any mistakes. But what about the rest of us? Is there any hope at all?

My name is The Realist. I'm contributing to this blog to add some perspective to the hard-edged idealism of this "Mr. Money Mustache" (who needs a fake catchy name like that anyway?).

So, life is hard in the modern world. Rapid changes in the business environment mean frequent layoffs and difficulty in holding a steady job. Health care inflation means we waste more of our small paychecks on medical costs each year. Gas prices are higher than they used to be, and so are other costs like food, child care, and education.

Yet some people manage to get by while others go bankrupt. Is it all just luck, or is there something we can do to beat the odds ourselves? As the Realist, I'll step in to present small but powerful steps to help you get ahead. There is sometimes a fine line between financial solvency and bankruptcy.

How fine? How about $25 a month?

Here's your lesson for the day: say you are breaking even – paying all your bills, buying $500 monthly of necessities on a credit card which gets paid off IN FULL each month with no interest, but not able to save a cent.

Then a McDonald's opens up next to the office where you work and you start buying lunch **once a week** instead of brown-bagging it. All of a sudden, you can't quite pay the credit card bill each month so a small balance starts to accrue.

- Month #1: there's a $525 balance and you pay $500
- Month #2: you are charged interest on the unpaid $25 from the first month at 20% ($0.42) so you're $25.42 short
- Month #3: interest on $25.42 ($0.43) plus this month's shortfall ($25) – you are now $50.85 short
- Oops, you are just a few days late for a payment and suddenly the whole $550 balance is subject to interest ($9.16) plus a late fee ($30). Now you're $89.16 in the hole.

Ahh, one burger a week, 89 bucks after 3 months. That's not so bad, is it? **YES IT IS.**

After 10 years, you'll have a credit card debt of **about $5,000**. If you couldn't pay it off when it was $525, things are looking much tougher now.

And that is $25 per month. Imagine someone so free spending that they went to McDonald's once per DAY?

That person would be over **$50,000 in debt after ten years.**

Wow, that is truly extreme. So the lessons for the day are:

- Never **EVER** let a credit card go even one month without paying the balance in full – because the interest rate is ridiculous, and if you ever slip up on the due date, they trick you by charging you interest on all your purchases for the whole month.
- There is a surprisingly fine line between staying afloat and sinking, even over a short period like ten years. Understand this and then all those stories about people going bankrupt start to make sense.
- But there is also **a fine line between staying afloat and rising up quickly to become very wealthy**.

What if the person breaking even above found a way to save $10 a day instead of spending $25 more than she made each month? The quick answer is that the same person would **would have a $50,000 stack of rapidly growing money** in ten years.

And that's just ten bucks a day – we can do much better than that, with some careful, surprisingly easy, fine tuning. Read on!

Mr. Money Mustache's Own Story

By Mr. Money Mustache

Sat, 09 Apr 2011 02:14:31 +0000

the "Realist" has been posting on my blog. I hope that doesn't happen too often. Sukka's too soft. You'll never get anywhere with piddly numbers like 25 bucks a month or even ten dollars a day.

And I had to laugh at that example.. would anyone really start buying lunch at a restaurant when they were already so tight on cash that they were saving NOTHING? And would they continue buying it once they saw that their credit card balance was starting to grow? What kind of idiot would do that? Why does this guy call himself the "Realist" with such an unrealistically stupid example?

What I want you to do is start thinking of REAL savings. Not putting away $5 or $150 per month, but more like **FIVE THOUSAND** per month. Not everyone can do that. But a middle-class American family with two teachers making $60k each per year, who are currently saving zero and struggling to get by? THEY SHOULD BE SOCKING AWAY $5000 PER MONTH. Word.

Here's my story, so you can see how it's done.

As a boy, I learned frugality by growing up in a family where my parents didn't buy much stuff. Instead of having stuff given to me, I had to get a paper route, trudging 6 days every week in the bleak Ontario, Canada weather for thirty bucks.

The shittiness of this experience made me realize that **I had it made** when I upgraded to a better job at age fifteen: working the pumps at the corner gas station. Earning $4.15 per hour, serving four customers simultaneously because we were so busy that rarely had time to "rest" in the oil-stained, partially heated standing-room-only metal booth. Imagine then, how amazing it was the next year to earn $6.50/hour to work in a convenience store with not only windows and doors to protect you from the weather, but heat and air conditioning that allowed you to wear **indoor clothing** year-round? I was making $650 ever month, going to high school, and by the end of a year, I had $5,000 in the bank.

My point is that in the United States and other rich countries, you've got it good. Even if you work in Wal-Mart, you make more money than I did, you get to walk around in a huge fancy store, and you can save almost everything you earn if you don't get ridiculous and waste it all. When I made $6.50 an hour, I knew it wasn't enough to afford a car or my own apartment at age sixteen. Well, it was enough, but only if I wanted to spend everything I earned. So I kept living at Mom's house, and was sure to make myself useful by helping take care of the place. When I started making more, I was ready to up the lifestyle a bit… but only a bit.

From here the MMM story goes on. I went to university, but picked the local one so I could continue to live in affordable manner in the spare bedrooms of family members. I worked in the summers and found affordable ways to party so I graduated with no debt. A decent professional job awaited at graduation, so I upped the ante to include my first used car and a house shared with many roommates (rent: $270/month).

After a few raises and new jobs, I moved to the USA, doubled the salary, but kept the used car and the living-with-roommates situation. Finally, a 20% downpayment had been saved for a house, so I made the jump to buy my first fixer-upper, sharing it and working on it with my future wife.

At this point, we had it made – double incomes and a low mortgage. We let the good times roll a little bit, enjoying the same luxuries as our peers and even doing plenty of international travel. But the difference was, we were spending only about 25% of our disposable income, while they were spending 90%.

The difference? They were subjecting themselves to just a few hidden additional expenses like auto loans, higher mortgages, newer clothes and more nights out at the restaurants. This meant we were saving a good $4,000 per month, which starts compounding when you invest it. We each earned a few pay raises over the years and found that our expenses actually *decreased* once we had the house fully outfitted and we had satisfied the travel bug a bit. The result was that we had a net savings of $7,000/month pretty soon, and we were on a treadmill that was pushing us forwards instead of fighting one that pulled us back. Life was fun and it looked normal from the outside. The difference was that we were amassing wealth very rapidly with each passing day.

At this point, we could have bought a huge house or a small fleet of nice cars. But instead, we spent the money on the ultimate luxury – quitting our jobs. For other people, a sailboat or a starting a local charitable trust might be the luxury of choice. You get to choose your own reward. But it's all about not getting stupid when you can't yet afford it.

For example, when you're making $35,000 per year, you can't be out buying $9.00 martinis on the weekends and financing a $25,000 new car. At this level, you are still in the cooking-at-home and riding your bike club. Maybe a $3,000 used car if you can buy it in cash and if it's really necessary to get to work.

When can you truly afford a fancy car like a BMW? Well, once you have the cash for it in the bank, your house and all other debts are fully paid off, and you are either retired or very comfortable with delaying your eventual retirement for a year or more to pay for this depreciating piece of luxury property, THEN you can roll into the dealership.

The funny part is, if you follow the ways of the Money Mustache, you'll hit these levels sooner than you think. So you can borrow to buy the BMW today, and pay for it forever. Or you can pick it up with the spare change in your wallet in the surprisingly-near future, and be a happier person for the wait.

Getting Started #1 – What am I Supposed to Do With All This Money?

By Mr. Money Mustache

Sun, 10 Apr 2011 21:06:17 +0000

 Hi, It's me the Realist again.

I think I've noticed a pattern with Mr. Money Mustache. He is part of what I like to call, "The Religiously Frugal". For him, the avoidance of spending is not just a way of reaching a goal… the frugality itself is the goal. *He actually likes this shit!* If you give this guy an extra million dollars before bed tonight, he'll still be riding his old bike to the grocery store tomorrow and bringing home the organic produce in a backpack from 1999.

But for the rest of us, who might find lifestyle changes difficult at first, let's focus on the practical side and the numbers.

As soon as you start not buying certain things, you will find that there are some dollars building up in your bank account. You keep getting paychecks, maybe the odd windfall from selling something on Craigslist or a gift from Grandma, etc., and it all goes straight to the bank.

Your goal every two weeks or so will be to count up all this extra cash, figure how much you need for upcoming bills, and sweep the rest to somewhere useful. Somewhere that either pays you interest, or saves you money by reducing the interest that *you* pay.
Note that there's a powerful double psychological trick going on here:

1. **You are keeping your bank account very low, which makes you really think twice about impulse purchases.**
   "Hmm, I can't buy this $1500 television set, because I've only got $300 in the bank and there's only one paycheck coming before my credit card statement will come due."
2. **Plus you are keeping the money as active as possible.**
   Every dollar is actually a little employee that will work for you, 24 hours a day, for as long as you keep it. But you don't want your employees hanging around eating donuts in the smoking lounge of your zero-interest checking account. You will simply sweep these green paper employees to wherever they will work hardest for you.

For most people those places, in order, are:

- paying off any high-interest debt like credit cards
- making sure all your deductions for your 401K plan at work are set to their maximum level, especially if they have employer matching
- paying off any other debts like car or student loans
- paying off extra principal on your home loan
- buying a conservative dividend-paying stock index fund – go to Vanguard.com and start an account to buy some units of the VFINX fund, or if you have a brokerage account you can **buy VTI shares**.
- last resort: just putting the money into a cash account that pays the highest level of interest you can find – Vanguard's Prime Money Market fund or a savings account somewhere like Capital One that has reasonable rates.

So there you have it. Save this posting. It is simplistic advice, but if you go out and read 50 books worth of financial and investing advice and distill them into only a few paragraphs, you'll probably end up at the same place.

Mr. Money Mustache actually reads these books every night, since they are part of his unusual idea of fun. He also follows Warren Buffet as if he's a sports hero and read his 800-page biography over two red-eyed days as soon as it came out. I encourage you to get more into investing too if you find it interesting, but if you just want the cheat sheet of what countless millionaires do with their money, just follow the points above and you are good.

These techniques will keep your employees working for you at a rate of between 5 and 12% per year. If we average it out to 7%, that means for every $100,000 you put to work, they will kick back $7,000 per year to you forever, with no work on your part. Setting some aside for inflation and a safety margin for occasional stock market crashes, we drop that to $4000 (more on that in an upcoming article).

So if you have 800,000 employees, you get a lifetime golden parachute of $32,000 per year, forever, with no thought or effort. Hopefully you are already starting to see the blinding and obvious light at the end of the tunnel. You are now saying, "Damn, I want those 800,000 employees working for me as soon as possible. How can I get them!? When can I start!?

And that boils down this blog to one simple idea – getting rich in the only way that is pretty much foolproof, as quickly as possible.

Getting Started #2 – The Higher Cause

By Mr. Money Mustache

Mon, 11 Apr 2011 23:14:46 +0000

 By Mr. Money Mustache

The Realist thinks he has me pegged. He's right about the 1999 REI Bookpacker Plus backpack, but in his calm by-the-numbers approach he is missing a lot of the reasons frugality is great.

No. Not just great: it's the ***only non-ridiculous lifestyle for the thinking person.*** And this is because for many of us who are happily frugal by choice, there is a higher cause beyond just money.

There are many reasons why the act of going to a store and **Buying Yourself A New Manufactured Product** should hurt a little bit. And while we're all still going to do it, it should be done carefully and after some thought, and after considering the alternatives.

One big reason is The Earth. Many of us feel some sort of love for our planet and a desire to preserve as much as possible of its healthy ecosystem for the rest of our fellow plants and animals to enjoy. Maybe even our children.

Well, unfortunately, buying products and preserving the Earth are at great odds with each other. You're not helping the Earth by buying a Toyota Prius. You just caused the burning of 1500 gallons of fuel and the mining of about eleven thousand pounds of Earth herself, just to produce a car of that size.. before you even buy its first tank of gas.

Eating meat, building a new house, and lots of other fun activities are equally destructive. **Assignment: Watch a few of the great documentaries like Fast Food Nation and Food Inc., and An Inconvenient Truth**. Then you might build up the appropriate level of guilty awareness to take the innocence out of shopping.

But then, you get to cheer up again. Mr. Money Mustache has got the solution for you. As luck would have it, *not buying things* is not only the solution for saving our planet, it is also the solution to your financial problems!

"But what about being happy?", you ask.

"I am buying these products to make me happy. Won't my happiness level drop if I stop buying them?"

Great question! That brings us to the next Big Reason Frugality is Great: it actually makes you happier, and there's science to back it up.

As logical people we probably agree that our main goal in life is to be happy. But what does happiness mean?

At the lowest level, it means that something in your body is releasing the right chemicals that wash through your bloodstream and make your brain interpret the situation as "good times".

What triggers these chemicals? Usually, things that we evolved to think are good for us – eating rich foods, having various pleasant experiences with potential mates, enjoying social status among our peers, and doing satisfying tasks like nesting, building and creating things. It's easy to understand how these things contributed to our survival in the past, so our brains evolved to reward us when we do them.

Shopping satisfies some of the later things in that list – you might get social status by having the latest trendy type of shoes, or you might trigger your nesting reward center by buying super cute shelving and accessories to organize your closet. It's a valid form of happiness, except it comes with the cost of taking away your freedom (money), which makes you have to worry more in the future – and in most cases, the short reward causes a longer period of suffering, so you're not coming out ahead.

So what is the alternative?

What if you were to write down the top ten activities that make you happy **and are good for your long-term happiness and health**, then start spending most of your time doing those things?

You would probably find that most of them are not expensive, and that they take so much time you don't have time for the expensive ones.

For example, for me the list would have things like:

- **have breakfast with my family every day**
- **have plenty of playing, learning and reading time with my son every day**
- **read 1 new book per week for myself**
- **have fun playing and creating music with friends at least 1 hour per week**
- **work out with weights at least 3 times/week and ride bikes and walk every day**
- **family hike or other outing 2 times per week**
- **try cooking a new semi-fancy recipe for the family or friends once per week**

Wow, there is some wholesome but fun stuff there.. and it already adds up to more than the amount of time I have available!

Like most people, I still have material cravings. And my unconscious mind is automatically trying to rationalize each one even as my conscious mind resists. For example, right now I have inexplicable desires to buy

- a new computer with a gigantic top-of-the-line monitor (for creative pursuits like music-making and blogging)
- an Apple iPad (for the educational games for kids, and around-the-house convenience for us adults)
- a few new high-end tools to add to my already-complete tool set (because I'm a professional carpenter these days… I shouldn't have to compromise by using any of remaining amateur-grade Ryobi tools even though they still work.. should I?)
- a $200 Zojirushi bread machine (to replace the rattly $10 garage one I use that still works fine)

But I just acknowledge the desires and put the research time needed for those purchases at the bottom of my to-do list. **If I get *everything else* on the list done**, I'm allowed to buy those things.

Meanwhile I can feel good about leading my existing simple life because the Earth doesn't want me to buy extra things anyway.

See? There is a higher cause.

What Does “Early Retirement” Mean Anyway?

By Mr. Money Mustache

Thu, 14 Apr 2011 04:08:40 +0000

 By Mr. Money Mustache

I love the topic of “Early Retirement”, because that alone is the subject of so many books. But as a reader of this blog, you get full discussion of that topic for free.

For previous generations, perhaps our parents or grandparents living stereotypical middle-class lives, retirement used to mean reaching age 65, pre-purchasing an RV, or a golf membership, or a one-story house with no stairs, and a wheelchair. The lucky ones would retain enough health to get out and buy their own groceries, the less fortunate would be in an assisted living facility by the time they hit 70.

And can you blame them? If you work 9-5, five days per week, fifty weeks per year, for 45 years, it’s pretty easy to get into a funk and lose your physical fitness, your immune system, and your desire for any sort of change.

But No, junior Mustaches, you and I reject that old kind of retirement and put forth our own definition: Retirement is earning the privilege of being free to enjoy the balanced lifestyle of our dreams, without "working for a living" getting in the way too much. You don't have to quit working altogether, you just have to feel secure enough to be choosy about your work, and your schedule.

My wife and I have have been "retired" for over five years now, and this is what it means to us: We quit our jobs as software engineers just about the time our first baby was due. But we didn't quit working altogether. I started a little company to build custom houses (since building things was always my most cherished hobby), while she started some very flexible part-time work with another company. Overall, we took about a 100% pay cut (since my construction company ended up losing money while she continued to earn some), but smarter people could accomplish this drastic career switch even more easily.

The idea is that if you are earning quite a bit, but you trim your lifestyle down so you are only living on about 25% of that amount, then you are ready to retire when:

- You've finished building your golden nest egg so you can give up the "75%" part of your salary you were saving.
- Your savings (combined with some optional part-time work) will continue generate that other 25% for you reliably, forever.

So what do you do with all the free time? That's up to you, of course. But here's what we have found ourselves doing for the past five years:

- Raising our little boy: sure, it is possible to raise kids with two careers, if you outsource most of the work to daycare or some sort of nanny. But we like to do it ourselves. A family breakfast together seven days a week, afternoons spent playing in the creek while the rest of the world works, time to read and learn together at all hours.. stuff like that.
- Becoming bicycle heads: without fixed schedules to meet, and being around at home a lot, it's easy to saunter around town by bicycle. We have 3 different types of bikes each, and use them to coast down to the

restaurants, bounce up the rocky mountain trails, and slice through the country roads and curvy canyons available near our house in Colorado.

- Taking impromptu trips: with no employers to ask for permission, we like to take two-month summer trips back to our homeland of Canada to let the two amazing sets of grandparents hang out with their grandson, and do lots of midweek camping or other outdoorsy trips. This is a big advantage in Colorado since the mountain highways are jammed up to the point of being unusable every weekend due to the ski resorts.
- Trying new things: although we feel pretty busy, it is a healthy business that still allows us to read books at night, try new exercise classes during the day, and meet friends for Indian Buffet lunches downtown. Back in the full-time career days, it was an over-the-top feeling of busy where it would take three weeks before you would get time to change a light bulb or to empty the dishwasher.

It’s kind of obvious that there are lots of benefits to early retirement. That’s why most of you are reading this blog. But we’re not just dreaming here, and we’re not making wimpy attempts at ‘early’ like age 50 or 55. What I advocate is putting the pedal to the metal and getting there in 7-10 years.

Getting Started #3 – Eliminate Short-Termitis, the Bankruptcy Disease

By Mr. Money Mustache

Sat, 16 Apr 2011 03:15:29 +0000

No SUV Required

I just saw one of those automatically generated text ads at the top of my Gmail account. Here's what it said:

2011 Pilot 4WD LX $319/mo

(note: this article was first published in April 2011 but you can substitute the current year whenever you read it.)

It gave me shivers to look at it, just because it is advertising a purchase that is so wrong on so many levels. We'll get into all of those levels in future postings, but… no, fuck it, let's talk about this particular piece of financial suicide right now.

- **The model year.** Why the hell would you buy a brand new car? Unless you're a taxi company and you are going to systematically run that vehicle 60,000 miles per year until it evaporates at a million miles, you don't need anything close to a brand new car to get around.
- **Honda Pilot.** A ridiculous truck from a great car company. 4500 pounds, 250 horsepower, 31 thousand dollars, all so you can carry usually-one-person on a paved road at 23 MPG.. 4 MPG worse than my work truck (a borrowed 1984 Nissan pickup) gets.
- **$319/month.** What!? Are we renting the truck here? We don't buy things by thinking about how much they are "per month".

And that brings us back to being on topic for today's post. There are several ways to think about a purchase. We can list them here in order of increasing intelligence.

1. I just want it and I don't know how much it costs – put it on my credit card and I'll deal with it later.
2. $319 per month? I think I could afford that because I'm already paying $299/month on my current car and that's only 20 bucks more.
3. $31,000 is the price of the Honda Pilot? I do have $32,000 in the bank so I guess I'll buy it.
4. $31,000 list price, plus $2400 sales tax, $1600 registration equals about $35 grand. If I buy a 2002 Honda Odyssey for $6000, which is the same vehicle in a more practical minivan body, I save $29,000. Over a ten year period, that money will compound at 7%, saving me a total of **$57 THOUSAND DOLLARS!**

Wow, is a 2011 Honda Pilot really worth **$57,000** more than a 2002 Honda Odyssey?

As a future young millionaire, you need to start thinking about all of your purchases as LONG-TERM events, not short-term ones. That means each decision should be carried forward in your mind **for at least 10 years**, rather than just until your next paycheck. Here are a few more fun examples.

- A deserving couple eating out at a restaurant twice a week, with wine, dessert, and coffee ($75), versus once a week with just a nice meal ($40): A difference of $110/week, compounded at 7% for ten years is **$82,756.** Would you rather have a luxuriously soft flabby physique from 1040 restaurant meals, or a leaner one and $82,756 in the bank?
- A Starbucks habit of picking up a regular coffee and biscotti on the way to work each workday. $4/day = $20/week = **$15,040 in coffee over just ten years!!**
- A new pair of shoes, or a few necessities from target, or a professional haircut.. once a month, for a total of $100. **$17300 of handbags and closet organizers and hair clippings in ten years!**

Now that you are amazed by the numbers, here is the simple formula for you to apply yourself.

- **to calculate a weekly expense compounded over ten years, multiply the price by 752**
- **for a monthly expense, multiply by 173**

.

You can fiddle around with the "future value calculator" at calculatorsoup.com for other interest rates and payment amounts.

See? Everything costs a thousand times more than the price tag you see, Now you don't want something just because your next paycheck will cover it. You want those big sums in bold above much more, right?

Good. We have now cured your case of Short-Termitis.

Getting Started #4 – If you Try Sometimes, you Just Might Find, you Get What You Need

By Mr. Money Mustache

Sun, 17 Apr 2011 16:45:38 +0000

By the Realist

Mr. Money Mustache has been a bit more reasonable lately, posting some numbers to back up his assertions. But I thought I should join in at this point to address something that has probably been in your mind: **how much can I really give up, without going crazy?**

After all, we all COULD live under a bridge and eat out of dumpsters, but no amount of money savings would make this worthwhile.

The miraculous answer to the question of how much you have to give up is: not much at all.

The reason is that you will be using your creativity to enjoy the lifestyle of your choice, at about 75% less than the standard cost. You can think of it as gaming the system. And it can be really fun once you get into it.

Let’s start by explaining why the system is so easy to game if you live in a so-called rich country like the US, Canada, Australia, or much of Europe.

Our country is home to a great surplus of wealth. It is very unevenly distributed, but there is plenty of it. We also have mind-bogglingly advanced technology and international trade which makes it so that certain goods are unbelievably cheap to buy.

You can buy enough basic food (rice, beans, oats) to power you for a day for about $1.00. You can buy enough oil to carry you and 3000 pounds of steel a distance of 40 miles, for $3.50.

But there are also goods that are incredibly overpriced. You can pay $900 for a decorative leather satchel that serves no purpose. A day’s worth of food could also cost $900 at the right (wrong) restaurants.

The whole game of our system is for the rich company owners to pay for advertisements to convince everyone else to buy their products at as high a price as possible. Ads and peer pressure make it very tempting to have the more expensive products.

Rich people and other big spenders buy these products briskly, driving up the high-priced products while simultaneously advancing industrial technology and competition **which actually drives down the price of medium-range products**.

But if you can peek through the ads and identify the actual needs that you want to meet, you can pick much more suitable products for yourself and save a bundle. To put a number to it, your goal should be to **spend only about 25%** of what the average person of your income spends in each product category.

By letting yourself spend 25%, instead of 0% like the guy living under the bridge, you can still be part of the good life, enjoying normal modern society without anyone even knowing what you are up to unless you choose to share it with them.

So to go through a few examples:

- **Goal: getting around the country on four wheels**: The average person spends $25k for a Honda CRV or Ford Explorer, you can spend $7k for a few-years-old Honda Fit or similar small (great!) hatchback.
- **Goal: not being naked all the time:** Average person spends $600/year on clothes from the mall, you can have a slightly smaller rotation of nice clothes (considerably nicer than Mr. Money Mustache's clothes, for example) from Target or Old Navy for $150/year
- **Goal: getting out for healthy bike rides:** your friends may buy $2400 carbon fiber road bikes. You can still find a great bike with some old-fashioned aluminum on the frame and carbon forks for $600 on Craigslist and ride just as fast as they do.

You can figure out a trick like this for just about every category of living expenses. I challenge you to tell me one (leave comments below if you like) that can't be improved over the standard person's expenditures.

There are some that are easier than others of course, so I like to cut those even more than 75% to free up some money to spend on things more dear to me. For example, I spend 0% of the average on cable TV and 10% of the average American dining out budget, but more than 100% of the average on housing since I like to live in a nice place. As long as my other savings can more than make up for the house I can still meet the 75% off goal.

So you're giving up some spending.. but you're not giving up your needs.. or your happiness, if you do it right.

Get Rich With… Bikes

By Mr. Money Mustache

Mon, 18 Apr 2011 23:43:11 +0000

Hey there.. welcome to the first edition of my new **"Get Rich With…"** series.

In these articles, we'll analyze a bunch of ideas, both new and old, to see what kind of impact they can have on your life. *(Hint: the impact will probably be a huge positive one, since these are all of my favorite moneymaking ideas)*.

And this edition is about the good ol' fashioned Bicycle.

The bike will probably turn out to be the best thing ever invented for humankind. It has taken us a long time to realize this, but at last there seems to be a permanent cycling-for-transport boom that is making its way even to the US, with bike trips increasing by hundreds of percent in all major cities in recent decades.

You see, bikes were invented before they were truly needed – when the world was sparsely populated. When cars came along, they seemed like an *improvement* on bikes, bringing us great speed without any effort at all.

Unfortunately, as a side effect they *destroyed the whole fuckin' world*, and made most of us dangerously obese too. With a new understanding of these side effects, the bike seems like an increasingly appealing alternative.

The fundamental reason for the bike's status as the **Greatest Invention of All Time** is its unique combination of simplicity, efficiency, and incredibly powerful health benefits- interestingly enough, exactly the opposite attributes of a car which is complex, inefficient, and horrible for your health due to the stress, inactivity and the cramped seated position.

With just a few moving parts, bikes are simple enough for most people to maintain entirely on their own without paying a mechanic.

And they are efficient in multiple ways: bikes weigh only 20-30 pounds but they can carry ten times their weight in rider and cargo. They convert a slow human with a walking speed of 3.5MPH into one of the fastest creatures on land, with an easy cruise of 15MPH and a top speed of over 40MPH on level ground and 50+ downhill for athletic people.

And the side effects are incredible.. vigorous biking can consume 1000 calories per hour, meaning you can burn off an entire pound of fat in one big 3 hour ride. This kind of exertion pretty much fixes up all the rest of your body for free too, clearing your arteries, polishing your kidneys and teeth, and giving you clean stylish hair and a better sense of humor, all after the first ride.

But another side effect is that bikes are good for your *wealth*. To start with the bare minimum: any mileage you put on your bike instead of your car **saves you about 50 cents per mile** in gas, depreciation, wear and maintenance. From this savings alone, doing a couple of bike errands per day (4 miles) in place of car errands will add up to **$10,752 over ten years**.

But the benefits are greater than that, of course.

Once you get into bicycling, it may grow on you. You may be able to go without a car, or you might find, like me, that having an expensive car is no longer useful as a status symbol to you. This would allow you to keep a less expensive car (saving **another $30,000+** over ten years).

You might find that biking around becomes a source of leisure as well as transportation. This would displace other more expensive leisure activities. Driving to the stadium to watch a monster truck rally with the family ($100) could be replaced by biking along the creek path and wading around in the waterfalls ($0). Replacing even $10 per week of paid leisure with free biking would **net you another $7680**.

Then there are incalculable things like health and productivity. But you know what? Fuck it, let's be bold enough to calculate them here:

By riding to work instead of driving, you are boosting your mood and your mental focus. This allows you to work smarter and longer. It also makes you better looking. These factors will allow you to earn at least an average of 5% more than your unfit counterparts would after various raises and job switches kick in. For a worker at the $50,000 annual level, this is a **$2500 per year boost ($37,500 after ten years with compounding)**.

Then there is the reduction of doctor visits and prescription drugs which will benefit you when you are older. This is a large future sum, but let's estimate the net present value to be about **$1000 per year ($15,000 over ten)**. And we haven't even gotten into the effect of greater health on your overall enjoyment of life.

Bonus: How to Make a SUPERBIKE

I've been a bike evangelist since childhood, but only recently did I discover the way to make your bike even MORE POWERFUL – with a BIKE TRAILER! In 2007 when my son was old enough to start riding around with me, I bought a trailer like this one* from Amazon. This revolutionized my biking life, because suddenly my wife and I could get the little lad to most of the close parts of town with no car! When you leave the kid behind, these trailers can also carry a massive $150 load of groceries, or even a bunch of stuff from Home Depot like a few cans of paint and some light fixtures. I've put over 1000 miles on this trailer since I bought it, meaning it has saved over $500 in car costs alone.

(Note: if you don't need to carry kids, go for an even more affordable grocery/cargo trailer like this one)

The final issue to address is the **"But I can't ride a bike in my city/climate/physical condition/age"** excuse that 99% of people over 12 in this country seem to cough up.

The answer is, in 99% of these cases: WRONG! Amsterdam is chilly and rainy, and this is how the bike scene looks there. In Hamilton, Canada, I rode year-round to get to McMaster University, through a dense downtown area in snow up to a foot deep. It was awesome. In Asia, the streets are packed with 90-year-old-ladies zooming along on cruisers with panniers full of chickens and such. If you are too heavy to look good on a bike right now, start biking and you soon will not be. JUST GET THE BIKE and you will see.

So, if you grow a big Money Mustache today and go out and get yourself a good city commuting bike – either visit your local bike shop of if you are an online-only shopper try one of these – then here's what you will have in ten years:

- **reduced mileage: $10,752**
- **less expensive cars: $30,000**
- **cheaper leisure: $7680**
- **increased income: $37,500**
- **reduced medical: $15,000**

  Total: **$100,932**

That's in only TEN YEARS!! A pretty good return on the investment in some thing you can find for about $300 on Walmart online, eh??

Footnotes:
** – Except I got my bike trailer on sale for about $80.. check your local Craigslist too*

*** Note – all multi-year figures are scaled to assume a 7% growth of the savings, if you had invested them instead of spending them on cars. But this effect is fairly small over 10 years. It gets bigger the longer you bike.*

How to come out WAY AHEAD when buying a used car

By Mr. Money Mustache

Tue, 19 Apr 2011 16:18:52 +0000

A recent comment from a valued Mr. Money Mustache reader asks something like this,
"I need a new car – we want a Honda CRV, but after looking at the used car listings, it looks like new might be a better deal, especially since it saves me from the need to put much money down".

As a first note: NOOOOOOOOOO! Don't Do It!!!!

This question is perfect, because it is exactly the same path many people go down when they end up with a new car. It's even more perfect because the CRV is the best-selling SUV in the country right now, so many people make the exact same decision.

The car industry makes it very easy and convenient to buy a new car, and by comparison it takes much more legwork to really score in the used car market. How exactly do you buy a used car, without feeling like a sucker walking onto a used car lot and having the little fast talking slickster start harassing you? What if you don't know much about used cars and how to take care of them?

Here are the steps I recommend, as a lifetime car addict who drives inexpensive cars but secretly covets every Audi and Volkswagen (and especially Tesla) that comes off the line. I love cars so much that I can identify any model currently for sale in the US (and give you all the stats on it), just by seeing a picture of one of its headlights or taillights. Even though I rarely buy them, I love shopping for cars.

Step 1 – Figure out what really is the best car for your needs
You might start with a certain model in mind (Honda CR-V in this case). Figure out what it is you like about this car. For the CR-V, you probably like the large interior space, easy loading/unloading of kids, combined with general Honda quality (it won't break, it will have good resale, it feels nice to drive). You can start by reading up on the CR-V on a website such as MSN Autos or just doing Google searches for the model.

There you will also find a list of competitors in that category. In this case, the category is "small SUV", so the competitors are stuff like Jeep Liberty, Ford Escape, Toyota Rav4. As with most Hondas, the CR-V is one of the best buys in this category.

But in South Florida, do you really travel on a lot of extremely rocky and steep mountain roads or deep snow? Or are most of the roads paved there? If so, maybe there is a way to keep the good attributes of a small SUV (interior space), while shedding some of the bad ones (high price, fuel economy rating of only 21/28MPG vs. your Civic's 32/38MPG).

This fuel difference alone will leave the average person about **$8300 poorer** after ten years, and that is before factoring in bigger tires, larger amounts of oil, more expensive maintenance and insurance, etc.

When it comes to interior space, three things matter most: rear seat legroom, headroom, and cargo space.
Since your other car is a Nissan Frontier pickup truck, you've already got cargo space (and traveling across wild beach areas!) covered. So you might also consider a 2009 Honda Fit, Scion xD, Nissan Versa, or Toyota Matrix. These are all tall, roomy passenger cars with awesome hatchback designs that can easily hold 5 people and stuff in the trunk. If you want even more space, you can click on a Yakima or Thule aerodynamic roof box for only

the times you need it – like family camping roadtrips and such. If you commute a lot, consider a 2004-2009 Toyota Prius at 50+ MPG, which also has a surprisingly large passenger and cargo area.

Step 2 – Figure out how much your car should cost used, and how NEW a used car you need.

If you drive a ton of miles, like 12,000 or more per year, you will cover 120k miles in 10 years. That means you should get a fairly new car so you can squeeze those 120 out of it without having anything break. So buy one with less than 60k on it so far. On the other hand, I only drive 4,000 miles per year. So I only need 40,000 over the next ten years. Because of this, I recently bought an older minivan for my construction business that already had 120,000 miles on it. After 10 years, I will still be at only 160k, well within the range of a Honda. As a result, my van only cost me $4800, yet for my purposes it is just as good as a new one worth over $30k.

For our example, let's stick with the CRV. Because you deserve some luxury, let's get you one that still matches the newest generation of CR-V. This generation came out in 2007, so I go to Edmunds.com and appraise the used value of a 2007 CR-V (midlevel EX model). Looks like the private party sale value averages around $15,860 in the Ft. Lauderdale area.

Step 3: Search your local Craigslist for Cars that Match

So in this reader's case, we we look at the South Florida Craigslist for a Honda CR-V, specifying a price range of $10,000 to $16,000, and **sort by price** (very important, since some used car sellers have a very vivid imagination when it comes to how high a price to ask for their used cars!). You want to pick out a meticulous-sounding, wealthy person who has babied their used car and done all scheduled maintenance, yet is selling it cheap because they don't really need the money. Dealers are fine too, as long as they have been around a few years and have a clear file with the better business bureau. Your best insurance is simply to get a car with the lowest mileage on the odometer. Here's a link to a Craigslist search for your model. Looking quickly at those results, I see some of the **2005** models out there actually have really low miles, like 49k, and are only about 10 grand. That is still a beautiful Honda, and compared to buying a new one at 30 grand with finance and taxes, and including money compounding, it will save you **more than $30,000 over ten years** just to get this used one with 49k miles!

Keep your eye on this craigslist search for a few weeks and call/email any of the ads that sound especially fair, honest, and detailed (good pictures, etc.).

Step 4: Go out and Buy your New Baby
When you are ready to make an offer, type the exact year/mileage of the target car into the Edmunds used car appraiser again, and send the seller an honest offer explaining your reasoning. Do this before you even go to look at their car, to keep yourself in the strongest bargaining position. Then if they accept, you go thoroughly look over/drive the car and if it's as good as they say, you buy it.

Regarding "saving" a cash cushion by buying a new car – Don't Do it!!! Any person over the age of 25 should definitely have a cash cushion large enough to live on for a few months AND buy a used car. But you don't get a cushion like this by buying a new car on credit. That is financial suicide! Instead, think ahead ten years, when you will still have the used car you buy now, AND you'll have an extra $30,000 in the bank because of not buying the new CRV on credit. AND on top of that, **you'll have an extra $450,000 or more** in the bank because of regularly reading the Mr. Money Mustache blog and applying more of his principles.

As a final note, since I think you want a Honda Fit or Toyota Prius and not a Honda CRV, so you can become even richer, here are two pre-set Craigslist searches for those in South Florida too!

http://miami.craigslist.org/search/cta?query=honda+fit&srchType=T&minAsk=8000&maxAsk=16000&sort=priceasc

http://miami.craigslist.org/search/cta?query=toyota+prius&srchType=T&minAsk=8000&maxAsk=16000&sort=priceasc

Yeah, Mr. Money Mustache, Good for You, but What About Real People?

By Mr. Money Mustache

Wed, 20 Apr 2011 17:36:09 +0000

First a quick editorial update:

Mr. Money Mustache and the Realist got into an epic battle last night, similar to the one where Good Superman and Bad Superman smashed each other around in the auto wrecking yard in Superman III.

However, unlike Superman, we ended up in a death grip of mutual strangulation where our atoms both fused into one Ultimate Financial Being.

So now you may find both sensitivity and brash belligerence displayed within the same posting. Also, Mr. Money Mustache may still refer to *himself in the third person, just because he finds this makes him sound more authoritative.*

. . .

I've been getting quite a few comments already, both online and offline. This is to be expected with a controversial topic like money. A blog like this can be offensive to many people, because the subject of money gets mixed in with your feelings around happiness and life security. So to have somebody telling you how to handle your **money**, when they don't even **know** you!? – Forget it!

But wait. First of all, Mr. Money Mustache is not judging you. He loves you and he is here to help.

And then there's the issue of our different life situations. Perhaps you feel alienated because you read [Mr. Money Mustache's Own Story]() and saw that he and a very cooperative wife started saving earlier than you did.

Don't worry! It's not a contest of how early you started or how quickly you race your way to early retirement. It's a contest of ***who can start making some changes in their life right now*** which bring them benefits ***in the surprisingly near future.***

On top of that, not every person is a good candidate for the MMM way of life. If you're already supporting a large number of children (or have other unstoppable life-and-death expenses) on a very small income, you are probably more frugal than me already and may gain very little from reading on.

But what I keep finding every time I meet new people, is that a surprisingly large number of people **do** have a pretty reasonable income – higher than what we currently live on – yet they all seem to be just barely keeping above the waves financially.

Others have a super-high income (which I define as as over $100k per year for a household – $50k for each person in a couple), yet STILL tend to borrow money for things like cars or even carry a credit card balance. **These people are really a key part of my target audience.**

These are the people who have the power to start feeling like lottery winners on the **gusher of income they are currently sitting on**, instead of being a slave to their current inefficient spending patterns.

It is commendable to advance yourself in a career to the point where you earn such a high income. But most people manage to build up a spending pattern that burns the money as quickly as it comes in.

If you are one of these people, you're in the right place. Because although I also earned a good income, the big difference between you and me is that I lived like an engineer both on *and off* the job.

That is, being an incurable engineer, I can't help but to calculate out every possible spending decision over a lifetime and weigh it against a dollar-value estimate of the potential hassle. So I make certain decisions differently and end up with the same desirable lifestyle – fairly big fancy house, good cars, a self-employed (and fully optional) ten hour workweek, lots of fun vacation travel per year – yet at drastically lower levels of cost and debt.

I started this blog figuring that surely some of these tricks could be boiled down into a nice periodic column. And here we are.

So to the people that are asking "What's next?", I can only say "Read on."

I've got a big list of future articles already written and more on the go, and I am accepting comments and criticisms from anyone, and writing them up with all my might. No expense or strategy will be spared. You will surely reject some of my ideas and perhaps outdo me on others (and then I can copy you!)

But the bottom line is if YOU, middle-income-person, make some of Mr. Money Mustache's recommended changes in your spending, **you will become rich quite quickly,** and **you will enjoy the process immensely.**

Silly and Misleading Retirement Calculators

By Mr. Money Mustache

Thu, 21 Apr 2011 18:34:53 +0000

 I think the main reason people seem amazed at the idea of retiring at age 30, 40, or even 50 is the lack of real information on early retirement in general.

If you type "retirement calculator" into a search engine these days, and enter some basic stats about yourself, you will find some very strange assumptions that are guiding you to think you need an absolute shitload of money to retire.

For example, I was once working through such a guide in a magazine from Northern Trust, a bank that caters to the wealthy. It went something like this:

"Consider your goals for retirement. What life events do you need to be prepared for? The following table lists average costs."

- children's and grandchildren's university education ($100,000 per child)

- children's and grandchildren's weddings ($25,000)
- assisted care facilities ($100,000 per year)
- medical costs
- funeral arrangements ($25,000)
- trust funds for loved ones
- estate and legacy planning
- charitable foundations

Wow.. looks like you are well into the millions before you even get to buy yourself some groceries!

Another retirement calculator on the CNN website has various parts to fill out and drop-down boxes pre-filled with handy values…

… like a desired retirement age of 65 and "living expenses" of **70% of your maximum pre-retirement income** which persist for the rest of your life (!)

That drop-down box with the 70% did not even offer a value lower than 40%.

This "percentage of income" concept is one of the most anti-Mustachian flaws of conventional financial planning. If you make $200,000 per year just before retiring, does this experience corrupt you so much that you need $140,000 per year for the rest of your life? And if so, how is it that the majority of households manage to live on less than half that amount, and some magical people even feel they are living like kings on a merely comfortable income, like 40 grand?

This goes back to the ideas of the "Get what you need" posting I made recently. And that is, why not go for maximum happiness rather than maximum consumption? I propose that maximum happiness is achieved at a spending level where you live in a comfortable space, eat healthy foods and get to do lots of active and stimulating things with friends. That doesn't have to cost $140,000 per year, or even $50,000 for most of us.

The other assumption they push on people is a very low rate of savings – they assume you will put less than the $16,500 annual limit on 401K contributions, and don't say much about what to do if you save more than that (which the high-income person mentioned a few paragraphs ago could certainly do).

So, these banks and mutual fund companies will continue to tell you that you need millions of dollars to retire, because it benefits them for you to invest your money with them. Luckily, it's a harmless bit of tomfoolery, since the saving benefits you as well. But the disservice they do is in scaring people out of dreaming to save faster, or to think about much shorter time horizons like 10 years, instead of just plain old "Age 65".

So I'll give you a quick retirement calculator of my own: a typical adult couple with no kids (or whose children are grown) can live very comfortably on $40,000 per year in retirement. My own family lives very comfortably with one child on somewhere in the $27,000 range.

You can shoot higher or lower depending on what level of luxury you want to pursue ($20-80k is a good absolute maximum sane range).. but if you don't want to calculate everything out, just go for $40k and figure out how to make your savings produce that for you. For a single person, it might be difficult to slice it in half because you lose some benefits from sharing a house and car. But you can come close.

Two quick early retirement budgets:

- An early retiree couple lives on $30k per year, earning 5k of that combined in part-time luxurious post-retirement careers. The remaining 25k per year is generated by their savings: *$625,000 of total savings are required to generate this amount of passive income using the 4% rule*.
- An Early Retiree Single person lives on $25k, earning $10k in his or her mini-career. $15k per year is required from the savings, which calls for a nest egg of about $375k.

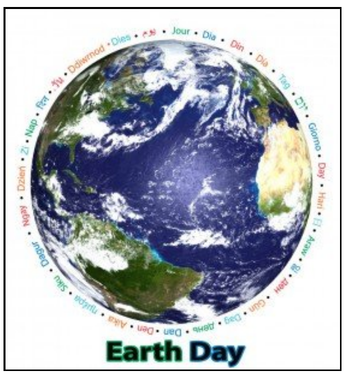
I'm working on some much more detailed and exciting sample budgets using real numbers from my own spending experiences before and after retirement. A recent reader posting suggested creating some "square one" plans that tell various hypothetical people in different walks of life exactly what to do to get to a nice retirement partytime in 10 years. Sounds good to me!

But they’re not done yet because the Call of the Canyons has sounded and the MMM family is off for some desert adventures and camping for a few days. You wouldn’t want a fake financial superhero who tells you how great it is to be free, but then sits at home all day as a slave to his blog, would you?? No.

Springy Debt instead of a Cash Cushion

By Mr. Money Mustache

Fri, 22 Apr 2011 14:14:01 +0000



Q: Mr. Money Mustache,

I was curious where you stood on the subject of building up a 6 month savings cushion versus flinging money at existing debt? I know what Dave Ramsay says, but I also value Mr. Money Mustache's experienced opinion. Thanks!

A: SOME sort of cushion, or 'stash as we refer to it here, is essential to keep your life smooth even in the event of losing a job or having a big unexpected expense. But it is a huge waste of money to keep money in the bank earning no interest, while paying higher interest on debts.

The solution I like to use is "springy debt". That is, debt that you can pay off or withdraw from, at will. A credit card is one form of springy debt. A mortgage, on the other hand, is one-way debt, since you can pay extra on the principal, but never suck money back out when needed.

I always set up a line of credit on whatever house I'm living in, and keep its balance at zero whenever possible. And I keep very little money in real cash in the bank – just a few thousand dollars, enough to cover a month or so of spending. Credit cards are automatically paid in full from this account, so it has to safely cover that without going into the red.

Any unpredictable expenses that aren't covered by the bank account can now come straight out of the line of credit! Most people can qualify for a line of credit big enough for quite a few months of emergency expenses.

Some fancy bank accounts even let you connect a line of credit directly to your bank account. This is even more convenient, as long as the interest rate is still close to the prime rate.

If people currently have unpaid credit card debt, this is much more of an emergency. You DEFINITELY don't want a cash cushion in this case, because the credit card is already an expensive cash cushion running in the negative. In this case, I'd keep paying off the credit card, and if possible get a line of credit on your house to pay off the credit cards, and then pay the line of credit down to increase your safety margin. And of course, cut spending drastically since unpaid credit cards mean you are walking very close to the edge of a steep cliff!

There will be lots of more detailed posts on dealing with debt in the future, since a lot of Junior Mustaches might be starting out with uncomfortable levels of the stuff.

Unleash your Inner Hasselhoff for Greater Riches

By Mr. Money Mustache

Sun, 24 Apr 2011 18:58:38 +0000

 “I drive a pickup truck because it’s comfortable and sometimes I need to haul things on the weekend”

“There’s nothing in the fridge right now so let’s just go out for dinner”

“I’ve read that Mr. Money Mustache claims to save $94,432 every ten years by riding a bike, but I don’t HAVE a bike, so that’s not an option for me”

“It would be nice not to have to drive an hour to work, but it’s just so much hassle to move to a new house”

Whenever I hear people explaining some of the biggest expenses of their lives, they are usually expressed in terms of emotions, hassle, and fear of the unknown. They are afraid of making changes in their lives because they are imagining a great tsunami of pain and inconvenience washing over them as soon as they try to change the status quo.

Oh no! I can't deal with the hassle! My life is already hard enough!

But guess what? **You're already IN the tsunami, Sukka!** How much hassle is it to get up uncomfortably early every morning, rush through breakfast, drive on a crowded and/or slushy road, stare out the office window as day after beautiful day slips by, and maybe miss out on bringing up your own children because you and your spouse both work full-time jobs?

So you're already an expert at dealing with hassle. You do it every day, and the reason you do it is for MONEY. If you have a job that you keep mostly because you need the money, you are a professional hassle-manager. Let's invent a slick new word for it – you are a **Hasselhoff.**

As a Hasselhoff, you should probably start looking around at who will pay you the most for putting up with hassle. Right now, perhaps you make $60,000 per year, which is $28.84 per hour. After all taxes, let's say that is about $22 per hour. You can advance to a better job, but maybe there are some other ways to use your time where you'll get paid **even more**.

What about the pickup truck owner at the top of this article? He has a 2005 Ford F-150. He drives it to work as well as using it for weekend 'hauling' and even road trips. But in truth, the truck is only loaded up with so much stuff that it wouldn't fit into a good hatchback car about 4 times per year. He drives 15,000 miles per year at an average of 17MPG. This costs him $3300 in fuel.

If Mr. Pickup could grow a bit of a Money Mustache and switch to a normal 5-passenger car that got 32MPG, his fuel cost would drop to about $1750… saving $1500 per year.

Now he has $1500 to spare, and 4 days per year when he can't quite fit everything he needs to haul into his Toyota Matrix. **That is $375 per day.** He has to either rent or borrow a truck to carry this stuff, or pay for a delivery truck. And he gets paid $375 to do it. Assuming the borrowing takes 4 hours longer than using his own truck, **he is getting $93.75 per hour for his Hasselhoff abilities, compared to the $22 per hour that he gets at work!**

Now that you see where I'm coming from, you can see that you ALSO are getting a raise over your day job by going to the grocery store, and spending the time to get yourself a bike.

But what about the biggest hassle listed above, moving to a new house?

It sounds like a big project. But I've done it a few times (currently on my third owned house and 9th address including rentals over the past 15 years), so on the most recent move I actually kept a work log of how much time it takes to move. I included sprucing up the old house for sale (or rent), house shopping, getting a mortgage and going to two closings, packing up the old house, doing the move in a $50 rented Uhaul truck, and unpacking into the new house. Overall, it took about **200 person hours**, equal to about one month of office work including commuting, or one month of the average American couple's combined television watching.

If this couple considers themselves professional Hasselhoffs and is earning $22 each per hour, then the move costs them $4400 of their time. If they are buying and selling a $250,000 house, and they lose 6% in realtor commissions and other closing costs, that adds $15,000. Yeesh, that's about 20 grand in total. Will they ever get that back?

The short answer is YES – **making a move like this actually saves them about $1600 a month** – enough to pay for the 20,000 in relocation costs AND have about $1450 a month left over to turbocharge their 'stash! (I included the math to back this up at the bottom of this post so you can review the calculations).

Using my usual 10-year example, this family who moves closer to work will be about **$256,000 richer after ten years, just for moving!** This is a gigantic part of what anyone needs to retire.

My job as Mr. Money Mustache is to teach you that whenever you hear the hassle bell ringing and trying to sway your purchasing decisions, make sure you sit down with a calculator and see if it's actually a hidden opportunity to increase your pay as a Hasselhoff. If you'd like some help with the calculations and some free entertainment to go with it, send me a comment with your own situation and we'll see how we can increase **your pay.**

— — — — —
The Math:

Their new house is within year-round biking distance (3 miles) of one job and medium car commuting distance (10 miles) of the second job. The old house was an average of 25 miles (40 mins) away for EACH person. Let's assume they both still drive for simplicity.

Old situation: 80 minutes round-trip x 2 people = 160 minutes/day = 53 hours/month.
53 hours/month x $22/hour **= $1173 per month of commuting time**
Plus driving costs of 50 miles roundtrip * 2 people * 20 days/month * 50 cents/mile
= $1000/month of commuting costs
Total: $2173/month for commuting

New Situation: 10 car-minutes for the close worker + 32 minutes for the further one, round-trip = 14 hours/month = **$308 per month of commuting time**
Plus driving costs for (6+20) roundtrip miles per day x 20 days/month x 50 cents/mile
= **$260/month in commuting costs**
Total: $568/month for commuting

Savings: $2173 – $568 = $1605 per month
If you use $150/month of this to service the debt on the extra $20k of moving costs, you have over $1450 left over.

Having "The Talk" with a Current or Potential Mate

By Mr. Money Mustache

Mon, 25 Apr 2011 21:11:41 +0000

My wife actually invented this post and I think it's a great concept that we should cover right away.

You see, Mrs. Money Mustache* is an indispensable part of our shared empire of frugality. Believe it or not, she was generally just as excited as I was about making an extra payment on the mortgage. Or buying and selling stuff on Craigslist whenever possible instead of resorting to retail. And she'll tend to cough just as loudly as I will when she hears about someone borrowing money to buy a new car, or notices everyone driving places that could easily be biked.

"Where can I find such a dream mate for myself," you may ask?

You may already have one – read on!

When we were just a young couple, we carried along the financial habits from our earlier lives. I was pretty much the way I am now, but young Miss M. was more of a normal person. When we eventually decided to move in together in Colorado and she landed a good job, she celebrated the new lifestyle by acquiring a taste for stylish outdoor active clothing. And a latte and snack each workday at the coffee shop near work. And the odd book from Amazon.com when interesting titles came along. Even I got into the spirit of things, celebrating a job upgrade of my own with a gleaming new motorcycle in 2001. We kept or finances mostly separated – each of us felt we were doing well, but we didn't really have any joint goals.

The problem was, those packages from Athleta and Amazon kept coming, even when she already had every season covered with sharp gear options. So did the books. The lattes and snacks weren't going anywhere since you need one each day. And my $10,000 motorcycle soon depreciated to $5000 even though it only had a few thousand miles on it.

So one day we had the Talk. It was a talk about our future, how we both seemed so busy with work, yet we hoped to have children in a few years. I was already into the idea of living off of investments someday, so I threw out the idea of retiring early.. as in BEFORE starting a family.

Was it possible? Some simple math showed that it definitely was (see the later post called "[The Shockingly Simple Math Behind Early Retirement]" for some of the numbers).

Then we dug out the last year worth of credit card statements. This woman has a thing for spreadsheets, so every category of expenses was totaled in various ways. What we learned is something that probably applies to most people: we were spending way more than expected on seemingly very small things. Like $700 per year on fancy coffee, and over a grand on clothing despite the fact that our closets were already full when we started. Books were several hundred per year too.

It's hard to give up things that are fun, and reading is definitely one of them. But the key was that we noticed ways to get the same enjoyment with drastically less spending. We could get the same books from the LIBRARY. We probably didn't actually need more clothing, especially if we would be quitting the jobs soon. We still liked restaurants, but maybe they could be a special occasion rather than a daily habit.

Now here's the golden nugget of this post: At that moment, a switch flipped in my future wife's mind and she was suddenly very excited about becoming a Mrs. Money Mustache herself.

"*Who wouldn't give up a few books and clothes and lattes if it meant* ***getting to work less while you have kids!?***," she asked.

The second neat cash catalyst was showing her how to set up her own investment accounts on Vanguard.com. I had already been stashing money away in my account there for a year or two, but once she had her own and was able to start transferring in paychecks, everything took off. I started getting nightly reports of the deposits and stock performance, and we'd compare our "net worth" summaries on the website.

Ever since the magic switch, our agreement on family finances has been golden. There are no arguments over money if you both share the same philosophy and goals. And now as parents of a young child, things are much less stressful when there are no worries over budget or lack of available time to spend with him.

It's also nice to have such a complicated common interest. We can talk for hours about future plans, how to be able to afford them by being even more frugal or shuffling money this way or that, and about how incredibly bright things are looking in general. It would probably sound pretty mundane and self-congratulatory to an outsider, but it beats arguing about who didn't do the dishes.

So if you want to move quickly with your own wealth plans, you'll need buy-in from your own little Mister or Missus.

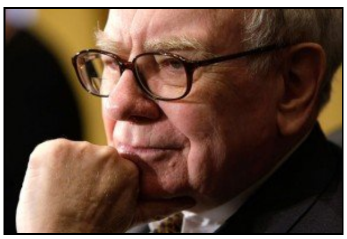
If you're single, you also have lots going for you too – low expenses, free time to put in overtime for extra earnings if you enjoy your job, and the potential to go to Hardcore Black Belt frugality modes that married people could only dream of, like keeping the furnace off until December or having back-to-back Buy-Nothing months.

But unless you remain single forever, you too might want to prepare for The Talk eventually, and think about how any potential mates would respond if you do whip out the big Money Mustache on them at some point in the relationship.
**(it is a sign of ultimate respect that she earns this title).*

Why Hardcore Saving is much more Powerful than Masterful Investing

By Mr. Money Mustache

Tue, 26 Apr 2011 21:27:56 +0000



"Hmm. In this case, Mr. Money Mustache has outdone me."

I was recently enjoying a conversation with a new friend. Despite my best efforts to sound normal and busy, this person eventually figured out that my wife and I don't actually do enough paid work to sustain the normal middle-class life we seem to lead. From here he pried out the fact that I am Mr. Money Mustache, the freaky magician who retired at 30. When people learn this, they immediately start grilling me on my presumably amazing investment skills. You have to be a stock market wizard to retire unusually early, don't you?

Unfortunately, I have a pretty poor investment record myself: as an early twentysomething I thought I could pick winning stocks, and ended up buying some that went to nearly zero. These were balanced by some that went up nicely, and these experiences combined to average out to about the same return the stock market as a whole would have given if I had just bought a nice index fund. Through my later 20s and 30s, I thought I was wise by squirreling lots of money away in the excellent Vanguard 500 (VFINX) index fund. But then Great Recession happened and (temporarily) backed out all those gains. I did make some reasonable money from home ownership and managing a rental house, but most of that was earned by increasing the value of the houses with old-fashioned sweat equity: renovations I did myself. In investments, you will win and lose on average, and statistically the best you should expect is to match the market (historically about 7-8% annually after inflation is subtracted out).

But let's hypothetically say you were a masterful investor. The best investor in modern history, Warren Buffett, has averaged investment returns of about 20% per year for over 40 years. This is about 4 times higher than the laziest investor who just bought guaranteed-return bonds.

Now let's say you are a masterful middle-income saver: you are married and you and your spouse earn $120,000 combined per year – say $90,000 after tax. With skill, the two of you can save at least **$50,000 per year** of your combined income between regular and retirement accounts.

Next, compare this with the average personal savings rate in the US:
– 6% right now (which is actually higher than usual because we are in a recession),
– as low as 1% during the big credit and spending boom of the mid-2000s.
An average couple would save less than **$5000 per year**.

So the difference between average and amazing investors is 4-to-1.
The difference between average and Mustache-level SAVERS is at least **10-to-1!!**

So over the short time horizon we are talking about (7-10 years to retirement), you'll get much better results by learning from this Blog (working on your spending), than you will by trying to be a fancy market-beating investor. That's why I often repeat the message of "just pay off all your debts, than start throwing it all into the Vanguard index fund".

Sure, it will go up and down with the broad stock index, but these are your *retirement* savings. You'll be living off of them for the rest of your life and while we can't predict the future, we CAN choose the statistically best place to get a high long-term return. And that place is in a low-fee index fund.

Also, by wiping out your debt (including mortgage) early on, you are effectively investing in some guaranteed bonds: paying off a 5% mortgage guarantees you a 5% return forever*. With no mortgage or other loans, my family's fixed costs are only a tiny fraction of what the typical indebted person needs to pull in. So there is lots of flexibility in when to sell off portions of the index fund for future living expenses. And the dividend checks keep coming every quarter, rain or shine.

Back to the point: by concentrating on SAVING rather than minute details of investing, you are stacking the odds in your favor while also freeing up time for the real deal – maximizing your fun in a cash-efficient way.

* Although this is not an inflation-adjusted number, since if you leave your mortgage unpaid forever, the remaining balance will eventually deflate away to a very small number relative to the cost of other things. In other words, you may be able to pay off your $150,000 mortgage when you're 100 with just the change in your wallet. But even 5% before inflation is still a good guaranteed return with today's treasury rates. Cautious people like me are still wise to pay off their mortgages early.

MMM Challenge: Save 100 Dollars This Week

By Mr. Money Mustache

Thu, 28 Apr 2011 04:36:59 +0000

Perhaps you have been reading along so far, enjoying our little growing community, but you're still not sure where to get started. There's plenty of personal finance advice out there, but you're too busy to search through all the disorganized piles of non-amusing advice. You want to do it the Mr. Money Mustache Way!

Well, It's time to start putting the pencil to the dollar bill now – earning yourself more freedom in only one week.

Right now, imagine your normal weekly routine – whatever you were planning to do if I hadn't published this life-changing article.

Now let's see if you can shave $100 off of it. I'm sure you can think of specific things, but here's a sample diet.

Idea: See if you can go out to lunch and dinner ZERO times in the whole week! Bring your lunch to work.
Credit: $20 or so per meal, compared to the number of times you went out last week.

Idea: See if you can combine ALL your driving into the trips you already do for work. Don't worry, you can still go out on the weekend, but you will be taking your bike!
Credit: $10 per day that you eliminate non-work driving.

Idea: Don't make ANY trips to stores, other than grocery stores, this week. You'll still be allowed to buy any missing items next week, but this exercise of delaying the purchases might be quite enriching.
Credit: $20 per store you would have normally visited, but postponed.

Tell us all how you are doing on the challenge! It's okay to break the rules if necessary, but you have to try your best.

At the end of the week, there will be some excellent things to do with the $100 or more you just saved. Remember that every time you figure out how to save money at one moment in time, it gives you some employees that you will keep working for you for the rest of your life. Congratulations!!

Mustache on the Move: Gas Prices Still Way Too Low

By Mr. Money Mustache

Thu, 28 Apr 2011 22:12:56 +0000

Mustache on the Move! A catchy new feature where I capture breaking frugality news in and around the Boulder/Longmont, Colorado area and report back to you. And these reports will always come with an eye-opening image from my handy telephone camera.

I love reading about gas prices, because here in the US, people get very excited about how incredibly crushing they are these days, despite being among the cheapest in the world. (the US national average gas price is about $3.79/gallon today, equivalent to about $1.00 US or $0.96 Canadian/litre for comparison). At this level, even the President talks about it regularly, hard-working families moan and groan, and people even buy, on average, slightly less gas guzzling cars.

But look at this guy driving in Longmont today. He's getting about 12 MPG driving around in the city in this Ford F-250 pickup truck.

His truck has been enhanced by poking the exhaust pipes out through the cargo bed. That way, the driver can pretend he's driving a REAL TRANSPORT TRUCK! But with no trailer. Because transport trucks are cool. I wish my bike could look like a transport truck! It also makes it LOUDER! Yeah!

Adding the mufflers to the cargo bed definitely cuts down your cargo capacity, but that's OK, because this guy is only carrying two little pieces of plastic gutter flashing in there anyway. And they are hanging out the back, because this F-250 wisely uses the "short bed" design which sacrifices cargo space for passenger space. Because a 12 MPG truck is ideal for carrying passengers around. Heck, he could even use it for commuting! But oddly enough, there was only one guy in it when I took this picture.

The final enhancement is that this Longmontian has paid to have the suspension RAISED even higher than normal and added absolutely huge tires with REALLY TALL treads on them. Shiny black wheels too. All of this increases the aerodynamic drag and rolling resistance even further than the stock design. But he won't even notice because the truck has over 300 horsepower – plenty to keep even this modified F-250 going at over 80 MPH on the Interstate! At that speed, it gets only 10 MPG. Meaning it burns 8 gallons of fuel every hour, coincidentally about the amount the Mustache family uses **every month**.

When I see things like this, (which I actually see pretty much every day), I believe that gasoline is still way, way, way too cheap.

But you can still save a ton of money by burning less of it yourself. I've got two more car-related posts coming up soon on exactly how to do that, so stay tuned!

Living well on the trailing edge of Luxury

By Mr. Money Mustache

Fri, 29 Apr 2011 15:52:51 +0000

"The only constant in the world is change"

That old quote is amazing, because it is so true no matter how deeply you think about it.

What is even deeper is that it is credited to a guy in 500 BC, back when things were changing almost unfathomably slower than they are right now. Let's review a little North American history in order to compound our amazement:

- For *thousands* of years, the natives of this continent lived a pretty constant lifestyle: hunting, skins, lots of cool techniques and tools, but only very small changes over hundreds of years.
- In the 1500s the Europeans started pushing their way in, bringing their farming and somewhat more complicated industry.

- It took “only” 300 years to get to the point of making things such as steam engines (in the 1800s).
- In the 50 year period from 1900 to the 1950s, people were shocked at the rapid introduction of things like cars, television, and washing machines. Technological change was much faster than that of the 1800s, but it STILL seems slow to us by today’s standards – 30 years later in the 1980s, televisions and washing machines were still pretty clunky.
- The next 20 years transformed the world even more quickly. In the 1980s, a few people got computers. In 1993, the Internet started to catch on. In 1999, everyone had several computers and internet access.. and cell phones had monochrome screens. In 2007, the Apple iPhone 1 stunned the technology world by taking everything previously invented and putting it in one sleek touchscreen tablet. In 2011, we are on our fourth version of the iPhone which makes the third version (from 2009) look like a hopeless caveman relic.. yet even the iPhone 4 is only months from being obsolete when the iPhone 5 comes out.
- And an update to this eight-year-old article from the perspective of 2019: Now we have the iPhone 10, gasoline cars have been made obsolete by Tesla and the human driver is the next thing on the chopping block, gigantic 4k televisions are the price of a fancy restaurant meal, Amazon has taken over almost every part of the retail world, and of course the exciting newer-than-new iPhone 5 from the previous bullet point is now so old-fashioned that a caveman would not even use it to fashion an arrowhead.

This long introduction is not the most concise way to get to my point, but it’s fun to remind you of this trend of *acceleration* so you can use it to your advantage.

You see, we humans are actually ***not very good*** at noticing accelerating trends. Maybe because all of our evolutionary history was spent in times of very slow social change.

So if you ask an average modern person about what things will be like 10 years in the future, they will look back 10 years in their life, estimate the amount of change that has happened in that time, and tack on that amount of change to the present world to guess what the future will be like. **They will totally miss the exponential rate of change, which means the future will surprise them**.

I like to have a chuckle occasionally at the "peak oil" movement's projection of future oil demand. These people say, "Well, our oil consumption doubled over the last 10 years, so in future decades we'll double again, and again, and aaugh, we'll all die when there is a huge shortage in the year 2040!!".

What they are missing is things like the acceleration of the solar panel – scientific novelty in 1954, widespread on every kid's calculator in 1990, expensive but powerful system to power a house in 2000, affordable and widespread on millions of rooftops in the US southwest in 2011… dirt-cheap and the only way anyone gets power for anything in the exponentially near future. (Update, this prediction came true and now I generate more than all the power I consume in my life from a DIY solar array the size of a single car parking space)

And even my prediction will quickly sound hokey and old-fashioned because I can't predict what unforeseen things will be invented the next few decades.

And now, finally. Getting back to the point for our students:

Because of this exponential change, our world is awash in almost-new consumer products. The hottest ones are in the stores, and the hottest ones from just a few months ago are abandoned in people's drawers and garages. You almost NEVER need to buy anything new, because you can have an almost-new item for 25-50% of the cost out of one of these drawers. People are so accustomed to buying new things, that they are willing to almost give away their used things even when they are barely used.

In the 1980s, this type of shopping would be less fun: people kept their fridges until the handles fell off, and their Sony cassette Walkmans weren't obsolete until years after they were bought and they started eating tapes. You'd replace it with a slightly smaller cassette walkman that had been upgraded to include red plastic instead of black. Cars had shorter, more maintenance-intensive lifespans. And there was no Craigslist, so moving used goods was a costly and time-consuming thing to attempt.

But today, and increasingly so in the future, we have reached a point where a rational consumer should see very little difference between new and used things – and you, rational consumer, should be buying very little new product.

I actually value used items more than new ones, because I like the idea that I prevented one new item from being manufactured in some toxic factory in Beijing. In the grocery store, we willingly pay more for Organic, Green, and Recycled things, but buying a used car, or fridge, or shirt, is actually cheaper than a new one even though it is much more friendly to the Earth!

I admit that I still buy new things occasionally, but only after working through this set of steps, which you can adopt too:

1. Feel desire to purchase new product: *"Man, I sure want a minivan for my construction business!"*

2. Analyze why you want the product – and if it would actually make you happier given your already-lacking free time: *"I want the van because it will help me carry more tools and make me efficient. And I could use it for family vacations too."*

3. Try to shoot holes in your analysis: *"I already have a borrowed rusty 1984 Nissan pickup truck that carries the tools just fine. Besides, if I buy a van, it will drain away the very money that I have been trying to earn. I'll have to work more just to have this work van!"*

4. Try to delay purchasing the product until after several milestones: *"OK, I do need the van eventually, because the truck is taking me hours each week to load and unload due to limited capacity. But I'll wait until after the new year, maybe even until spring since I won't be working much in the winter anyway."*

5. If the desire to purchase persists, start shopping for the item on Craigslist. Find the best deal, and only once you have enough cash on hand to buy it with no loans, and without compromising any of your other money goals, go ahead and buy it.
6. If no suitable items come up on Craigslist after several weeks/months of searching, you may consider buying it New.

When I first wrote this article in October 2010, I was still not quite to step 5 with the van, and I would never get to #6 since there are plenty on Craig's. But in February 2011, I eventually did make the purchase, and I was content knowing that I got what was somebody's $32,000 dream luxury van in 1999, and is really amazingly close to being as useful as a 2011 van.. for the pocket-change amount of $4800.

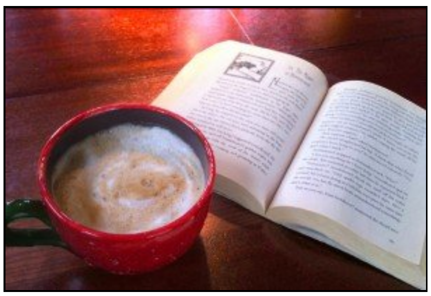
Eight years later, this van has crisscrossed the continent with large loads of people and camping gear, and helped me complete hundreds of thousands of dollars of construction projects. And it's still in superb condition, aside from some bleaching from the relentless Colorado sun. It was a great buy, and the satisfaction of its frugal origins just makes it even better.

That's life on the trailing edge!

Weekend Edition: Retire in your Mind even if you Love your Job

By Mr. Money Mustache

Sat, 30 Apr 2011 18:00:47 +0000



Happy Weekend to all! The *Weekend Edition* feature of Mr. Money Mustache is designed to be read while wearing pajamas and/or slippers, and sipping casual weekend drinks. It will feature a selection of lifestyle and philosophical articles, since the weekend is a place where we take a break from the intense hammering of our day jobs. As a bonus, *Mrs*. Money Mustache herself has a writing or two on the go which she plans to publish in a future Weekend Edition.

– – –

From the stream of interesting comments and the reader statistics, it seems we already have a broad and varied family of people reading together here at MMM. Some are looking to solve a problem of pressing debts and stress. Others are planning a full escape from the rat race. But a third category is the **Satisfied Working Advanced Mustachian Individual (Swami)**.

Swamis have seen through the tricks of our consumer society for years, and as a result they live relatively efficient lives, and thus have no shortage of money. But they also are good at their jobs, and they enjoy them. Because of their financial independence, they have no fear of losing their jobs, and this actually makes them more valuable workers.

As advanced as it may sound, this effect has been noted for many generations. There's an old financial musing that circulates on the Internet called "A Man With Savings" (it was apparently written in the era before men realized that women could have savings too). Here's an excerpt:

"A man with savings can afford to resign from his job if his principles so dictate. And for this reason he'll never need to do so. A man who can afford to quit is much more useful to his company, and therefore more readily promoted. He can afford to give his company the benefit of his most candid judgments."

And, in contemporary language, you might have noticed the comment at the bottom of the "Yeah Mr. Money Mustache.." article right on this blog, where a wise reader writes:

"My experience is that work becomes a lot more fun when you don't need the paycheck. Like you I'm an engineer and I love solving the puzzles that appear in our product development lab. But I hate sitting in long meetings, making powerpoints, and taking on boring busywork– so I don't. I'm good enough at the parts I like (perhaps only just) that I get away with it, while my colleagues who took on the commitments of a high-maintenance lifestyle basically have to eat what management dishes out."

Looking back to my own engineering career, I remember meeting other Swamis just like this fellow. They were an inspiration to me, when they would patiently hold their ground even in the face of senior management. "I'm sorry, I've got a family, so I'm not available to take that 5-day business trip to San Jose to give powerpoint presentations to the other department. But I'd be happy to work with them from my desk right here during regular business hours".

These guys knew how to have fun at work, and just as the ancient text predicts, it was usually the more nervous and whiny people who worried openly about layoffs, who disappeared when layoffs came.

The message is that even if you're not looking to actually retire from your job, your working life will improve quite magically as you grow your money mustache and start needing the job less and less.

I think that shooting for achieving Swami status is an ideal thing for EVERYONE who is still working – whether your goal is complete early retirement or just continued elevation along the levels of the Swami scale (note that most CEOs and celebrity types are in fact Swamis themselves – they absolutely do not need the money from working but they continue out of a sense of purpose).

In fact, I am finding that most people who are currently stuck under a load of debt can not even imagine the possibility of early retirement. It is too much of a leap for them, perhaps because they have only experienced the tippy back end of the financial conveyor belt. They can't quite see the exponential change that happens in your cashflow as you move from big debt, to neutral, to big savings. For these people, it's perfectly safe to start by envisioning a life of being slightly less beholden to their employers.

Do you think you can do it? What is standing in your way at this point? As both I and all of the other non-mustachioed financial gurus have been chanting for years, *we're not just making this shit up!* Mr. Money Mustache may seem like a mystical and impossible role model, but his only superpower is his ability to *not buy things*. Way, way easier than becoming a sports hero or a registered nurse.

In the upcoming week I'm planning more posts with novel cost-cutting techniques including one called *Insurance: a tax on people who are bad at math*. I also hope to get some bidirectional heckling going on as the results of the $100 Challenge* come in.

*If you haven't read that post or started doing the challenge yourself, get your lazy ass moving! It's fun! I don't care if you already have a money mustache so long that you constantly trip over it, or are still staring in the mirror hoping for the first bits of stubble to appear. Everyone can save an extra $100. We're doing the challenge here at MMM headquarters, and surprisingly, even though I *thought* we were already operating at a low-fat level, we've already cut the week's spending by more than $100 just by having this challenge hovering over our heads. A good practice exercise indeed.

Car Strategies to Cut your Costs in Four (or more)

By Mr. Money Mustache

Mon, 02 May 2011 17:01:57 +0000

Look at this amazing picture I covertly took on a walk through my neighborhood just this past weekend. It reminded me that it's time to talk about cars again, because I love them, and because almost everyone is wasting way, way too much money on their cars. The average person's car transportation costs ALONE ($8,000 or so per person per year) are enough to make the difference between desperate debt and comfortable riches over a number of years. This overspending is common because it's a confusing field if you don't come up with a good Car Strategy. So here we go.

Rule #1: You NEVER, EVER borrow money to buy a car.
Ouch, that might piss some people off, since something like 73 percent of new cars in the US are financed. But if you look at that 73 percent of buyers, you'll see that they are usually underwater on a lot of loans, quite nervous about losing their jobs, and have a net worth of close to zero. And if you look at the average self-made millionaire, you'll find they do not buy new cars at all and they never buy on credit. Call me old-fashioned, but I think it's unwise to even spend **all of your money** on a car, let alone **more**

than all of your money by getting a loan! If you're starting out and desperately need your first car, save up a few paychecks, scrape together $2000, and you have a decent late '90s compact car (from Craigslist of course) that will keep you on the road for several years. Since you won't have a car loan, you'll easily accumulate the $8-10k needed to get some really nice 3-years-new wheels when you're more established, a cycle you can repeat every 10 years or so. Just for reference, even as someone with a wife, a small child, no debts and enough money to not work, I STILL consider my 2005 Scion Xa which is worth less than $7000 right now to be on the newer and fancier side of what we need.

Rule #2: Buy a car that does whatever you will use it for MOST.
If you are a US Forest Service contractor who lives in a cabin in the woods, and all of your driving is done on dirt roads with slopes greater than 20 degrees, you can have that Toyota Tacoma with raised suspension and dirt tires. If the slopes are only moderately steep and rocky, wise up and use the more efficient Subaru Forester. If you live in a city with the luxury of actual pavement, SUVs and trucks should not even be on your radar screen. And there is NO valid personal use for a new full-size pickup of any sort*. If you are a farmer and need to carry a lot of soggy manure and hay, you may use a 1991 full-size as long as you never take it off the farm. Use a car. Your car should be optimized to carry **your ass** and occasionally your family around, while burning the minimum possible amount of gas. You don't need 7-passenger capacity "for those times your kids have friends over" because that doesn't happen often enough to justify the gas-wasting you'd be doing the other 99% of the time you drive that vehicle. Remember that all your friends have cars too, so there is almost always a spare seat that will get the passengers where they need to go. You don't need to be the one paying for it.

Rule #3: Cars are for inter-city travel, not for quick trips to the store
Many of my neighbors provide me with all-day amusement by coming and going from their driveways 5 times per day with their cars. What the fuck are they all doing? What is so time sensitive about errands #1-#4 that they could not be consolidated into errand #5 or the main trip to or from work? When I feel an urge to use my own car, I get a little excited and start scribbling a list called "Car Trip" on a piece of scrap paper. I imagine all the

things I can get done with the car and after a day or two of soul-searching and trying to figure out if the trip can be postponed further, I finally step out to the garage and guiltily fire up the tiny car.

Rule #4: Cars are not for picking up your teenage kids from the high school 1 mile away

My neighbors actually do this. Our kids have not yet evolved away the ability to walk on their own legs – let's try to preserve this ability in our species by using it. As a bonus, you'll be able to afford to spend more time with them.

Rule #5: If you have to own two cars, pick them to cover all your needs efficiently.

When I walk through the neighborhood, all around me I see families with two SUVs, A pickup truck and an SUV, two large sedans, and various other ridiculous combinations in the driveway. Are these people deliberately trying to keep themselves in debt forever, or are they just totally clueless? It is unlikely that both people in a couple need to simultaneously scale rocky mountain roads with 7 passengers on board each. So at least one car should be an efficient commuter – a used 2004-2009 Toyota Prius available for under $10,000 is a good choice. The person who drives the most can use this one. If the second person can carpool with the first, or is close enough to work to bike or have very minimal driving, the second car can be a larger wagon (Volkswagen Jetta or Subaru Legacy perhaps, or even an older minivan). Then you get the best of both worlds – massive capacity on roadtrips and minimal gas-burning on workdays.

Rule #6: You don't "look funny" driving a small car. This is all in your head. But you DO look funny ponying up your car payment every month.

As a newcomer to the United States, I only recently encountered the idea that some people think it is not manly for a Big Man or stylish for a Fancy Woman to be seen in certain types of cars. Some people refer fearfully to the idea of Prius ownership as "driving around in a suppository". When newspaper articles announce new car models, the inevitable stream of grammatically-challenged reader comments is mostly about how the car *looks*.

Fuck off with your concerns about style! Cars are all awesome machines and even the crappiest one has been designed and built by great artists, engineers, and workers. Your job is to pick the one that enhances your life the most, and unless you are already financially independent, you'll get a lot more enhancement from getting some cash in your 'stash than you will from having 20″ wheels and 3 rows of leather seating.

Rule #7: Cars don't cost you money *per month,* they cost you money *per mile.*

Because folks are financing their cars and not thinking about the long term, most people assume that once a car is in your driveway, you might as well use it with abandon. ***Totally wrong!*** When the car sits in your driveway, or even better, your locked garage, it is staying largely intact. As soon as you start using it, you are burning gas, oil, tires, wearing out each of its approximately 20,000 components, increasing your risk of a crash, and connecting a large-diameter Shop Vac hose to your Money Mustache, ripping out precious strands right from their follicles.

Here's what happens when you use your cars sparingly: they last forever. Guess how much I have spent over the past ten years in repairs and maintenance other than oil changes (which I do myself, partly to save a few bucks, but mostly because it is fun and manly)? Guess how many sets of tires I have worn through? How many speeding tickets or accidents?

Zero.

It's not because I am an amazing car whiz. It's because I only drive when it's actually necessary. For me, that adds up to about 4,000-6,000 miles per year for a family of three. After 10 years, you've pretty much worn out a single set of tires and nothing at all has even broken on your reliable used car.

It's a harsh series of lessons, and admittedly there's some repetition up there, but it is *really fun* to rant about this stuff. And sometimes ranting is necessary because car spending is the first and foremost thing standing between the struggling masses and Mustachian Freedom and Riches. That means YOU!

Are you still thinking it's OK to borrow money for cars? If so, **let's hear some comments** and I can present alternatives that will leave you much richer.

** Footnote on the full-size pickup truck issue: As a part-time professional carpenter who occasionally builds custom houses, I find that an older large minivan kicks the ass of a full-size pickup for cargo capacity, while costing less, handling better, and burning much less gas. Also, it does double-duty for carrying a lot of people, unlike pickups. But I would still never use this van for single-person transport. Look into it!*

MMM Save $100 This Week Challenge: Update

By Mr. Money Mustache

Tue, 03 May 2011 16:38:33 +0000

Good Morning Mustachian Trainees.

I posted the [$100 Challenge] last Wednesday Night, which made Thursday the first day. The post got an unusually large number of reads last week, and again today due to a valued reader who posted it to her facebook page – thanks a lot!

But have you actually been challenging yourself? Or did you just read it and have a chuckle and then head out in the Mercedes ML500 for pints and steaks at the brew pub?

I must admit I was feeling a bit casual myself when I wrote it. I was secretly thinking, "Listen up, we already the Triple M'z, Yo / We runnin' so lean, nobody could shave a dolla' from the routine".

But once I published the challenge, a little change came over me. And it happened to Mrs. Money Mustache too, since she is a very close participant in this blog. Even though none of you are actually watching us to check for cheating, we really felt motivated to see what we could do. I stuck a piece of scrap paper onto the breakfast bar and started writing down the results – including all our spending and transportation – each day. Here's where we're at so far:

Thursday:
Bike Miles: 7, Car Miles: 0, Spending: $54 on groceries
Challenge Savings: I made a point of looking over my grocery bill to check for mistakes. It turns out when you buy a lot of organic produce as I do, mistakes are very common (1 in 4 receipts perhaps). Today I found that my $5.00/5 lb bag of organic Gala apples was billed at $12.00. I asked the service guy and he very apologetically handed over the full $12.00 as a compensation. Free apples – sweet! Deliberately decided to skip buying beer and wine this week to save some money and also give my fitness training a boost. We normally have about 3 drinks each per week at $1.50 each: **Credit:** $12.00 for apples and for $9.00 for beer and wine **= $21.00.**

Friday:
Bike Miles: 7, Car Miles: 0, Spending: $0 – no unusual challenge savings today, the wife and I just worked at home while the lad was in preschool.

Saturday: Bike Miles: 11, Car Miles: 0, Spending: $0.
Challenge Savings: Wife normally would have driven to CrossFit class due to unusually chilly weather, but she toughed up for the challenge, saving 1 car trip. Also, I was trimming the grass with my old inherited corded weed eater. The piece of crap finally gave out and shot broken plastic parts all over the lawn. I smashed it up in rage and threw it into the metal recycling bin, and ALMOST hopped on the bike to head to Home Depot to pick out a new cordless one. Then a bubble appeared over my head and Barney from the Simpsons started calling "Chaaaaalllenge Weeeek!". So I went to the shed and grabbed the long manual shears instead. I had never tried using these for lawn and weed edging before, but surprise, they are shockingly fast, silent, and I also got a bit of added workout for free! I don't think I'll even buy a weed-eater again. So I'll award myself **$60** for the day.

Sunday: Bike Miles: 2, Car Miles: 0, Spending: $0. Raining part of the day. Played in and around the house. No unusual Savings, but you can't complain about a day where you spent zero dollars!

Monday: Bike Miles: 8, Car Miles: 0, Spending: $95 ($25 insurance copayfor the boy's 5-year checkup and immunizations, $70 for wife's first experimental visit to chiropractor which we later decided was a total waste of money). Wife took son to the doctor's office in the bike trailer instead of the car, for which we get **$10** according to the scoring system.

Perhaps a little more detail than you wanted. But it's interesting to me to note that we **haven't even started the car** in almost a week, and we have spent only $54+$95 even on a week with very unusual medical bills. But of course, other random expenses come up in other weeks like school supplies or clothing.

So so far, with an honest accounting of savings directly because of MMM challenge week, I'm up **$91.00 in five days!** This is pretty significant since as a family that lives on about $40k, our average spending is normally $547 on the typical five-day period. We've cut it by a further one sixth just because of this savings game!

Imagine how much cutting could be done for a family that is currently living on $50, 70, or 100+ thousand per year!

Any stories of your own savings to share?

Instant Wealth Boost by Tidying up your Bank Accounts

By Mr. Money Mustache

Wed, 04 May 2011 16:02:51 +0000

Being Mr. Money Mustache comes with certain privileges and responsibilities.

One of those responsibilities is helping individuals with their problems, and there was a rather interesting problem on the operating table here at MMM headquarters last week:

A reader who happens to live in Colorado set up an appointment to meet with me to review her own finances in detail and see if I could help. This person is highly intelligent and also earns a solid income, so I figured she would probably already have everything set up pretty optimally.

But in a bit of good luck for both of us, I was quite wrong. And the experience opened my eyes to a situation that might be quite common out there in the increasingly complicated world of personal finance.

I got her permission to write about the situation, (with a few details changed to protect privacy). Check out this amazing story to see if any of it echoes in your own life:

My friend had recently run into a bunch of expenses – home repair, tax bill, and replacing a dying old car with a newer (but still used) car.When you add it all up, there were new debts of about $47,000, distributed across three different loans like this:

- $8000 on a credit card at 13%
- $20,000 on a personal line of credit at 10%
- $13,000 on a car loan at 7%.

The total monthly payments on this nasty selection were about $327 of interest, plus a few hundred in principal, making a total load of $650.

When you add in a home mortgage, it all sounds pretty bleak, right?

But then we reviewed the rest of her financial accounts. There were a lot of them. They included:

- 4 different savings and checking accounts, some of them left over from before she got married, with an average of about $1000 kicking around in each.
- A home equity line of credit with $10000 in available credit at about 6%
- Several old investment accounts left over from previous employers' stock purchase plans, etc. (regular taxable accounts, not 401(k)s) with a balance of $20,000 that hadn't been touched in 10 years!
- Yet another family account with $10,000 available earning no interest.

To make a long story short, the assets that were sitting around were more than enough to cover all of the high-interest debt!

We decided she would close ALL the old accounts and consolidate everything (salary direct deposit, automatic bill-pays, etc.) into just one clean and tidy checking account. This would free up those few thousand from the mostly-unused checking accounts and make life simpler to manage as well.

Then she would rake together the money from everywhere else to pay off ALL of these debts – even the car loan.

Now my friend will have NO credit card payments, NO personal line of credit, NO car payments, and will be back to just paying a conservative mortgage payment. With the extra monthly cashflow, she can start making extra payments on the mortgage and bringing the line of credit down as well to increase her cash cushion.

These results are not typical, but a similar situation IS typical. Many people (including me) sometimes hang on to multiple checking or investment accounts just for sentimental purposes, without thinking of the cost – even when there are outstanding debts that could save you big bucks if you just transfer your own money from one place to another.

Mrs. MM and I were motivated enough by this experience to do some cleaning up of our own. We sold off some of our own non-retirement index fund savings (in Vanguard) to finally wipe out the rest of the home mortgage I've been procrastinating on for the past few years.

There is always an opportunity cost to this, because the stock market goes up over time. But since we're at a stage of life where simplicity will do us more good than additional money, it is just good strategy to be fully out of debt. Especially with the Mr. Money Mustache philosophy of maximizing the Good Life by minimizing stress even while you Amass a Stash of Cash.

If you have debt with an interest rate higher than what you are getting in savings, you might enjoy a bit of moneymaking simplification like this as well. If you have specific questions or situations to share, send 'em in! If you like, we can even make an inspirational story out of YOU.

Get Rich With: Profitable Leisure Time

By Mr. Money Mustache

Thu, 05 May 2011 15:13:09 +0000

Here at Mr. Money Mustache, the word "Leisure" seems to come up quite a bit. This is not only because it is a classic and amusing old-fashioned word, much like "Fancy", but also because it is at the core of what we are promoting – it represents the freedom to do things that make you happy.

But in our rich society, leisure time has become confusingly mixed with massive spending. Partly because it is a natural human instinct to show off one's power and wealth, and partly because millions of clever companies are advertising to us every day that we need to buy their products in order to enjoy leisure time.

So let's break it down logically. When you are not at work, you need to do SOMETHING with your time. The possibilities are endless.

You can eat and sleep and watch TV, which are very low-cost activities, but they can be depressing in large doses.

So many higher-achieving people take it up a notch and actually get off the couch. They hop into their cars and head out to the shopping mall, the restaurant, the golf course, or the ski resort. Some hitch the powerboat or the trailer full of ATVs to the back of their full-size pickup and head for the lake or the mountains. The added challenge of any of these activities over watching TV is invigorating and it helps to make these people happy. Leisure!

The only problem is that expensive leisure activities like these will burn off your Money Mustache (not to mention the polar ice caps) faster than you can say "Louis Vuitton".

What if there were a way to get the same happiness out of different activities? What if we thought about our leisure time as a blank slate on which to paint a picture of happiness, instead of just a clean lake through which to drive our motorboat? It is easier than it sounds. The key is to make a **list** of all the things you think you might enjoy doing. I'll try it out right now on myself.

Learning to fly an airplane
Playing in the sparkling glacier-fed local creek with my son
Surfing on Kauai'i's North shore
Carving through canyons on a silent bicycle
Downhill mountain bike riding at a ski resort
Renovating my own kitchen
Picking out a new outfit at a high-end men's store
Planting a garden
Carving through canyons on a sporty motorcycle
Canoeing in the local lakes
Mountain bike riding in the mountains at the edge of town

All of the things above sound fun to me. But now I can sort the list based on how expensive they are, cheapest ones first:

Playing in the sparkling glacier-fed local creek with my son ($0)
Carving through canyons on a silent bicycle ($0 – $10 if you break up the cost of bike ownership across many rides)
Canoeing in the local lakes ($0 – $10)

Mountain bike riding in the mountains at the edge of town ($5 to cover round-trip car mileage)
Planting a garden ($100/year of plants and materials – averaging to $2 per hour of gardening)
Renovating my own kitchen ($4000 of materials but actually a NEGATIVE cost if you do a good job and eventually sell your house)
Carving through canyons on a sporty motorcycle ($100 if you average out motorcycle ownership costs and gas)
Downhill mountain bike riding at a ski resort ($100 for transportation and lift tickets)
Picking out a new outfit at a high-end men's store ($400?)
Surfing on Kauai'i's North shore ($200/day)
Learning to fly an airplane ($300/day)

Wow, reviewing the list, I see that there are already more than enough activities in the first half of that list to use up ALL of my free time. But they are just as much fun to me as the expensive ones at the end of the list.. especially since I like things that are peaceful and give my mind a rest. And if you care at all about the Earth, there are obvious advantages too.

Many people where I live in Colorado have mountain activities as their default or only leisure activity. They typically visit sites that are 100 miles into the mountains, away from the cities at the base of the mountains where we live. At the IRS standard rate of $0.50 per mile, they are spending $100 per weekend on transportation, on top of a restaurant meal or two, various outdoor gear purchases, ski passes in the winter, etc. The average mountainist probably spends $250/month on the mountain habit.

Let's compare a Mountainist to a Money Mustachist – the MM goes deep into the mountains only four times per year, but really makes the most of it those four times. For the rest of her outdoor leisure, she enjoys the closer locations that require minimal driving and no overnight condo rentals. Her average mountain costs are $50/month. This $200/month savings becomes **$35,400 after ten years** with compounding. Yet both of these people get outdoors every weekend, enjoying amazing scenery and fresh air that would make most of the world's population jealous.

As an expansion of this idea, consider hobbies that actually EARN you money. If you like renovating or gardening, blogging to a big audience or selling stuff on ebay, you can actually reverse the treadmill of leisure spending. For example: over a five year period in the early 2000s, I spent about a third of my weekends remodeling my first home. It was incredibly fun and it got me started on the path to more serious house building work. But it also helped increase the value of this house, after subtracting materials costs, by about $50,000. I also moved out of this house and rented it out for five additional years, which brought some appreciation. All-told, this hobby brought in about **$120,000 over ten years.** And it provided countless hours of entertainment, which could have been spent in more costly ways like shopping or airplane-flying.

The mountains are amazingly beautiful. But so are so many other things, including the feeling of waking up on a Monday morning and realizing you don't have to go to work unless you want to – today or any other day. So make your own leisure list. And share it with your fellow readers in the comments, if you like.

Closing Ceremonies for “Save $100 This Week” Challenge

By Mr. Money Mustache

Fri, 06 May 2011 02:51:03 +0000

Many people clicked “like” on the simplistic yet powerful challenge called Save $100 this Week.

Did YOU do the challenge? I did, and now I’ve got more than $100 extra compared to what I would otherwise have.

You DO know you have to actually do this stuff if you want to become wealthy, don’t you? As much as I love you reading every day, you won’t get much richer with only that level of commitment.

To finish up reporting the MMM family results, we had $91 saved in the first five days, then:
Tuesday: Bike Miles: 6, Car Miles: 0, Spending: $0. Challenge savings: $10 for skipped car trips.
Wednesday: Bike Miles 4, Car Miles: 40 (ouch! wife drove to another town for a lady party, I drove my construction van around town to do a bit of actual paid work). Spending: $38 on groceries.
Week Total: Bike Miles: 45, Car Miles: 40, Spending: $187,
Challenge Savings: $101

Not Bad! If I were to keep this challenge going permanently, I’d end up about **$76,800 richer** after ten years. I probably will keep some of the changes I learned this week , because as with every challenge, you actually learn unexpected things as you go through it.

Now what do we do with the $100 we saved? If you have any debt, make a point of paying an extra $100 towards your highest interest balance, and do it quickly, before you get around to spending the hundred on something else!

For me, being recently mortgage-free, I can 'stash it back into the handy Vanguard 500 Index Fund (VFINX) where it will grow and pay dividends for the rest of my life. By the time I die at age 104, these 100 little employees will have contributed about $10,000 of income to me, even after adjusting for inflation, in the form of growth and dividends.

Sweet? Yeah, sweeter than just burning through another $100 tank of gas!

The NEXT challenge, coming tomorrow morning, will take it up a level. Actually about eighty nine levels, if you consider the levels to be measured in linear steps, because the prize for this challenge is **nine thousand dollars!**

Tune in tomorrow baby.

MMM Challenge: Cut your Cash-Leaking Umbilical Cord

By Mr. Money Mustache

Fri, 06 May 2011 15:23:16 +0000

The prize for this week's challenge is about **Nine Thousand Dollars,** plus getting the equivalent of about **36 weeks of extra vacation time each year.** That would bring you up fairly close to my own level of leisure.

The challenge, of course, is to immediately and completely cancel your cable television service forever.

Now I will admit that TV programming has really advanced in modern years, with a spectacular array of new channels. At one moment, you could be watching a young Brazilian girl blow a Vuvuzela at the World Cup game, and with just the press of a thumb you could be transported into the deepest reaches of a smoke-filled senior center watching a bingo game. You can study the most incredibly well produced commercials for an average of 16.5 minutes out of every hour, which will keep you informed of the must-have products of the day, protecting you from accidentally thinking your current products were sufficient.

Contemporary television must be great, because everyone has it. If you've ever gone for a night time walk around your town, as I like to do often, you’ll notice that almost EVERY SINGLE HOUSE has flashing blue light streaming out through its windows. If you peek through into their living rooms, as I also like to do, you’ll notice that about 28% of the televisions are currently displaying advertisements, as predicted by the fraction of 16.5 over 60 minutes in the previous paragraph. The average American (and Canadian) watches about 4 hours of the stuff each day, adding to 28 hours a week or thirty-six 40-hour workweeks per year.

“No”, you may be saying, “Actually I skip all the commercials with my Tivo, and I have HBO and watch all the advanced dramas and stuff”. Good for you! You have made your time-wasting more efficient at a cost of just a few extra dollars per month. If time wasting were our goal, and this were the Mr. Mundane Mustache blog, you would have already won the challenge.

But now let’s talk about why you DON’T want to have cable TV, or any television service anymore.

First of all, let’s be honest: **you can’t afford it!** If you are spending 50 bucks a month on TV service, and throwing in the electricity to run a typical modern TV (about $2/month), you’re burning **$9204 every ten years**. And that is assuming that you are 100% immune to television advertising – some of the world’s smartest people are willing to bet about $40 billion per year (the annual television advertising budget in the US) that you are wrong on that.

Unless you are already retired, you probably have something better to do with $9204 and an extra 28 hours per week of free time than TV, right? Hmm.. how would that look? Is it possible to have a fun life without TV service?

Well, let’s ask Mr. Money Mustache, for starters. I haven’t had any sort of TV service for about the last 12 years. (That’s right.. we’re raising a 5-year-old child who has probably seen less than a dozen TV commercials in his life so far. Surely a good thing for a kid’s mental development and ability to focus on things).

What does a non-TV watcher do with the extra free time? I guess you could do a lot of things. I use the extra time to cook good food and take care of the house, and go out for night time walks to watch other people watching TV. I also get to play with my son a lot more than a normal dad. The extra time adds up to a lot of reading to your kids – at age 5, we've already burned through about 50 big novels (Harry Potters and Hobbits and such), and of course a few hundred kid picture books before that. With only five years of experience I'm still learning about how to be a good parent, but surely this kind of time together kicks the ass of family nights watching Dora the Explorer?

And the news, oh the nightly news. When you switch to getting your news entirely in written form, you are spared, for life, from the Pointless Bad News like Chilean Miners and families destroyed by car crashes. We didn't even know there was a "Royal Wedding" until after it had happened. You just read the real stuff. Health, Science, Business, News, Politics.. it's all there, with 100% less slow-talking fake-expressioned makeup-wearing tanning salon faces.

But don't worry, without TV you'll still get your share of moving pictures. Almost everything is available on a streaming basis over the Internet anyway, YouTube has the funniest things on Earth for free, Netflix has all the commercial movies and great documentaries for $9 per month if you need it, and your friends all have DVD collections from which you can borrow any time you like!

My persuasive list could go on and on, but I think at this point, the arguments presented have been so profound that there are only two possibilities for readers:

1) You already do NOT have TV and you just read through with a big toothy smile on your face, clapping your hands and shouting out, "Yeah Mr. Money Mustache! You tell 'em! Tell it like it is! Hallelujah! Enn-Ohh to tha Tee-Vee Babeh!!!!!

2) You DO currently have TV, but you started reading this and your heart started to pound and you realized the colossal enormity of your mistake to this point, the wasted life, the frying brains of your beloved children, and

you ran out to the living room and unplugged the thing immediately. Now when you finish reading this article, you're going to look up the customer service phone number to your cable company and get that umbilical cord cut OFF!

CONGRATULATIONS!!!!! Please share your stories of your new life without Cable TV. What do you do at night? Where will you 'stash the extra money each month? Prosperity and happiness for all. Whew, not bad for just a weekly challenge.

Weekend Edition: Happy Mother's Day

By Mr. Money Mustache

Sun, 08 May 2011 13:38:25 +0000

It's a warm and sunny day here at the Money Mustache Compound, and my little boy and his Mum are outside planting some new plants in an area of the backyard known as the Mother's Day Garden.

It all started one year when Mrs. M decided to tackle a certain back corner of the yard to make a private oasis. It was Mother's Day, and as my gift to her I built some raised planter boxes and a curved brick path that winds through the garden. She shaped the land and planted an artistic array of desert-friendly plants which have since grown into a beautiful work of living art.

These are all things that we would have done anyway, since we like gardening, but by making it a Mother's Day tradition, we bring fun and a feeling of tradition to the event – without necessarily actually buying anything.

This strange purchase-free celebration of holidays comes naturally to me, because I was raised in what I later learned is an odd family that very rarely exchanges gifts on any occasion. It's a big family with four grown kids and both parents still out there, old and healthy, and we all love each other and get along wonderfully with no politics whatsoever. And yet somehow with all this love and respect, we are hard-pressed to even guess each other's exact birthdays and we would have no idea what to buy each other if there were some requirement imposed on us to buy "gifts".

Since nobody told me this was unusual, it became my idea of normal. And it wasn't until I grew up, went through a few bachelor years, and eventually moved to the United States that I started learning about this interesting consumption/gift pattern that has sprung up around special occasions.

When you're an alien, you can see the strangeness of a society better than its natives. And what I saw was people driving to a store, purchasing one or more plastic or polished mineral items that each represent destroying a small slice of our shared planet, and handing it to their loved ones at these pre-determined dates. Surprise! I love you! Here's a part of the planet I wrecked for you, Hooray!!

The giving of these manufactured gifts also represents a sacrifice. The buyer typically puts herself deeper into a hole of debt, ensuring a longer and more precarious lifetime of trying to escape it. And the recipient sacrifices a bit of space in their house to store the usually-unnecessary item until it is eventually discarded.

It all sounds so sad, Mr. Money Mustache! Where has all the love gone? How can we get it back?

The answer lies in your smile and in your hands. From now on, you are officially **freed from having to buy people gifts!** You can start caring for people you love by making them artistic things from natural materials you find outside (carving, sanding, gathering, arranging). You can DO things for them, like surprising them with a big fancy dinner at home or a day together doing something outside. On your bikes or your feet. You can call them or write a really thoughtful email with lots of pictures, if you're into writing.

But the bottom line is, you really, really do not have to buy things for people most of the time.

Hosting a birthday party for your little child should not be about having each guest's parents purchase plastic things wrapped in additional layers of plastic from Target. It should be about giving them some time to run rampant with their friends, sharing some sugary cake, and letting the adults drink plenty of wine and have a good chuckle at their youngsters. Institute a No Gifts policy for your own kids' birthday parties and encourage your friends to do the same!

At the big gift holidays like Christmas*, make a Gift Ceasefire agreement between all willing adults, and concentrate your efforts only on getting fun (but still thoughtful) presents for the kids, who still benefit a bit from Santa-type magic.

If you're a wealthy grandparent or a fully grown Mustachian without debts, YOU can afford to buy people gifts, so use your power wisely to get them things that last a lifetime and actually enhance their lives. Like starting a university savings fund for their children or getting them a set of good bikes and a trailer so they can start **building a happy bicycle lifestyle**.

Don't be shy. Don't be afraid to break the consumer tradition. You know it's the right thing to do, and your family will see the sincerity behind your new traditions and respect you even more for it. You'll be getting closer to living a true and honest life where time is the greatest gift.

Which brings us back to Mother's Day. Happy Mother's Day Mum – we all love you!

** Christmas – I still call it that because I'm old-fashioned, even though I don't know much about the actual religious figures behind the event and I believe in separation of Church and 'Stash. But you can substitute your own name for the holiday season.*

Mrs. Money Mustache: The Secret Life of Frugality

By Mr. Money Mustache

Mon, 09 May 2011 15:09:58 +0000

Introduction: *Welcome to the first post by Mrs. Money Mustache herself. Long a lurker on this blog, she finally has some things to say to balance Mr. Money Mustache's manly voice.*

There are many people that dream of retiring early. I was never one of those people. The idea of retirement in my 30s didn't make any sense to me as I was just starting out in an exciting new career in software.

When Mr. Money Mustache spoke of retirement, I would think to myself: "Why?" I like my job. I like going to work and hanging out with co-workers, some of who happen to be my friends. I'm challenging my brain and feel good about things. I am happy.

You might feel the same way. I've met many people that do. They are happy working and for them, it's a good life. Why retire?

For me, the reason appeared when we were ready to start a family. I became frugal and saved money so I could be home with my child. It was a no-brainer, as they say.

Early retirement is not about having a lot of money. It's about having choices. It's about finding yourself. You need to discard that old stuffy image of retirement where couples buy an RV and take up touring the country, or just sit around at home and occasionally play golf. Early retirement is a lifestyle and it is unique for everyone.

Frankly, I don't really like the words "early retirement", as it doesn't convey the true meaning. For me, it was life-changing and unexpected. It changed me in unthinkable ways. It brought me all kinds of things: happiness, balance, change, freedom, time, travel, family, motherhood, and health. But, most of all, I found myself.

When you're in the midst of all of this money-saving, a change comes over you. At first it's subtle and you barely notice it, but after practicing all these Mustachian principles for a few years, you find yourself suddenly free from society's expectations of you. You're in another realm altogether.

You don't care if you wear the same pair of pants three days in a row. You don't care if you don't know last night's hockey scores. You might actually start to feel sick in big department stores from all the excess. And, you are beginning to feel happier.

It takes a while to reach this level of anti-consumption, but if you keep it up, you'll get there. And, when you do, things start to make a lot more sense. Saving money becomes ridiculously easy. You will suddenly realize why depression and health problems so often go along with debt problems. You learn about yourself because you've shed your skin of consumer culture. You've taken a step back and you can finally see yourself and everything around you much more clearly. You figure out what matters and what doesn't. And, you learn this much earlier than most people which means you have the rest of your life to be happy.

One of the best compliments I ever received was when a wise older woman told me that I had figured out what life was all about much earlier than most. We all know what life's really about in theory, but until you can truly separate yourself from how we've been molded by society, you don't really get it.

It often strikes me as quite incredible that our culture could have gone a completely different route — one where there was a greater sense of community and less emphasis on money and spending. It also amazes me that in many ways, the ways we used to live were much more satisfying.

When you hear stories or read books about people who have less yet are still somehow living happily, there is always a common thread: a sense of community. Groups of women sitting around canning tomatoes together and laughing, kids running around outdoors inventing games, farmers tending to the fields and helping each other out. This might not seem like your idea of a good time, but these kinds of activities and unity feed our souls. We don't get much of this anymore and when we do, it is often based in an activity that revolves around spending money.

You don't need to have money to discover this. You don't need to retire. But for me, becoming frugal in order to save money helped me discover this hidden secret of life. I have found myself and have found a lifestyle that benefits me and my family. I can teach my child early on that you don't need money to be happy. Not just by telling him about it, but by showing him. I can choose hikes instead of manicures and camping trips instead of Disneyland, and I know that I am much happier for it.

You can live this secret life too!

I’ll show you my Electricity Bill if You show me Yours

By Mr. Money Mustache

Tue, 10 May 2011 14:38:41 +0000

Weekend Edition behind us, it’s time to get back to some hard numbers and some moneymakin’.

After slicing your car expenses, which we’ve done a lot recently, one of the next big areas with room to simultaneously save money and preserve some clean breathing air is your electricity consumption. How much are you using? Where does it all go? Are there ways to cut the waste without cutting the actual amount of fun you have in your household?

The answer is a definite YES. Check the following out:

From the website of the US Department of Energy, we see that,
“In 2008, the average annual electricity consumption for a U.S. household was 11,040 kWh, an average of ***920 kilowatt-hours (kWh) per month****. Tennessee had the highest annual consumption at 15,624 kWh and Maine the lowest at 6,252 kWh.”*

“Meh”, you may say. “Those numbers don’t mean much to me”. Well how about this:
“A Hundred and Ten Bucks Per Month at a typical electric rate of 12

cents/kWh"
(note that electricity rates vary widely even within the US – yet another useful factor to consider when choosing a place to settle).

Note that a Kilowatt Hour means using 1000 watts for one hour – a very bright old-school light bulb (100 watts) for 10 hours or an electric clothes dryer (5000 watts) for about 12 minutes.

Yet here in the MMM House, I just looked back at the past year's electric bills and did some math. Our average is **299 kWh per month, less than one third of the US average.***

(Update: since writing this article almost two years ago, we've made a few improvements and nowadays the average is a further 30% lower, at around 200 kWh/month).

This surprised me**, because I have a pretty big house (2600 square feet), a family of three, a big shiny double door fridge, very nice lighting, and we cook and "work" at home – computers and dishwasher get used almost every day. I also use lots of power tools and even do occasional electric welding here. Why do other people use three times as much electricity than I do for my admittedly luxurious lifestyle?

Using a simple energy meter and doing some calculations, I figured out that my 299 kWh are getting used up like this:
Fridge: 47
Lights: 60
Dishwasher: 40
Furnace blower (winter) or Air Conditioner (summer): 50
Computers: 36
Clothes Dryer: 30
Tools and other/unknown: 36

If the average household could get their energy use down to Mustachian levels, they would save about $75/month or **$13,725 every ten years including compounding**. So how can they do it?

I believe the big three would be these things:

Clothes Drying: your dryer is the biggest energy hog in the house. It costs 60 cents per hour to run it, which sounds cheap unless you are one of those fools who do two loads of laundry per day, in which case you burn $39/month versus the MMM family's $3.60. We accomplish this by doing only about two loads per week (you only need to wash clothes, sheets, or towels if they actually LOOK or SMELL unusual – otherwise just hang 'em up and use 'em again). And hanging the clothes to dry most of the time, saving the dryer only for things that are annoying or time-consuming to hang like huge armloads of socks and underwear. Start hanging up your pants and shirts, I'm not accepting excuses on this one. You have plenty of free time now that you've cancelled your cable TV.

Lighting: This seems amazing to me, but many, many people still use old-fashioned incandescent lights in their house. Tons of them. These things are STUPID. If you are one of these people, get up from your chair RIGHT NOW. Take out ALL YOUR RIDICULOUS BULBS AND SMASH THEM. Put in LED bulbs in all fixtures.

These days, they give you an even better light color than the old incandescent style, if you stick to bulbs with a high CRI rating (color rendering index) and a color "temperature" of between 2700 and 3000K.

Here's a shortcut to the bulbs I use in my own houses and commercial buildings, updated for late 2017:

Normal base bulbs: just grab anything from Costco, Home Depot, or **these from Amazon**.

Recessed (Can) Light Bulbs: These Hyperikon bulbs are top-of the line and still only about $6

Track Light Bulbs: most track lights use 120 volt GU10 bulbs. I am now using **these generic bulbs from Amazon** and they are incredibly good. High CRI, perfect color, and dimmable.

Basic screw-in bulbs only cost only about $1.50 each, and they save you about $8.23 per year each. That is an 549 percent annual return on investment. And you can easily get dimmable versions if needed. **Go**

change all the bulbs right now, then punch yourself in the face once for each incandescent bulb you were still using, now, in the year 2011, more than ten years since CFLs became available. Then come back to your computer and finish reading this article. Welcome back. Remember to turn off lights you're not using as well.. duh.

Air Conditioning: This costs 35-60 cents per hour that you run it. If you go crazy with it, you can burn $100 or more in a month.
But here there is a valid difference for some people. In the US, the whole bottom right quarter of the country is an absolute steam bath for half of the year. Mr Money Mustache wants you to cut out your waste, but not your comfort. So there's going to be some serious air conditioning going on there. But you can keep it efficient by running the machine mostly at night and coasting through the peak hours with the windows and doors closed, keeping out the heat. Block any direct sunlight with insulated curtains. And chill the house only to 80 degrees and wear shorts, instead of being like the old folks who keep their places like a meat freezer and wear sweaters around indoors during the Miami summer.

And for the rest of us, like my beloved neighbors here in Colorado who are already using their A/C all around me, use the climate to your advantage. If it is cool at night, open the windows up entirely and use a window fan or whole house fan to blow out hot air all night while you sleep. A big fan burns 1 cent per hour of electricity, 50 times less than a whole house air conditioner. I do this, and even in July I can coast through a 100 degree day with the house staying cool all day – just long enough to open up for the next cool night.

If you hit those big three, an average person should be able to at least cut the bill in half.

And there you go, another 13 grand or so towards your retirement 10 years from now. Amazing, isn't it!?

*Another interesting note about my house – last year I rented it out to some international friends who happened to be visiting the US for exactly one month while we were away on a long trip. The usage by the tenants for that month was **971 kWh**, just a bit more than the national average. So there you have it – usage is controlled by YOU, not your house or your location.

**Actually, it didn't surprise me, because obviously I've been watching my electricity usage for decades and know exactly how much I use. I mean, come on, I'm Mr. Fuckin' Money Mustache!! But I thought it flowed nicely to say, "this surprised me".. and more importantly I thought it might surprise YOU, Junior Mustache.

The Elephant in the Room: Housing

By Mr. Money Mustache

Wed, 11 May 2011 14:30:29 +0000

 electricity.. all without even mentioning housing. Why?

Housing is the biggest expense for most people, and there are some retirement/frugality/simple living blogs out there that advise you to live in an absolutely minimal house or even an RV.

It is true that there are big savings to be had there – with the ongoing housing market party, if you live in a neighborhood with healthy real estate sales right now, you could probably pick up a foreclosed house from a bank somewhere else in your town for less than half-price. Or you could buy a used RV for $20k and cut your housing costs down by 90% for life.

But I wouldn't do it, so I can't tell you to do it. The Mr. Money Mustache way is not about living on the cheap. It's about living the GOOD LIFE on the cheap. The fundamental lesson of this blog is that there is plenty of money to go around in this country, so you don't have to eliminate your spending on **everything** to become financially independent. You just have to cut out your **waste.** And for the most part, buying yourself a home is not a waste.

I live in one of the nicer houses in my town's nicest (to me) neighborhood*. I love the four bedrooms and four bathrooms and the nice renovations I've done throughout this place over the past five years. It's not the cheapest place to live, but to me it's the best value of living pleasure to the dollar I could create. A house to me is the home base of your spirit, and when you're living a frugal and natural life, you spend a lot of time at home. As a result, when I compare the sunk cost of my housing to that of other people, I come out behind.

But by having a comfortable house, you can be happy and entertained at home without having to go out. You can have friends over and maybe even feel less of a need for vacations – enjoying Staycations instead. All of us in my family feel more confident and productive in a good house, so on an income basis, it might even be paying for itself.

The only caveat to all of this feel-good housing talk is to realize that it is still a luxury you are buying yourself. A house is not an asset (unless it is a cash-producing rental property), it's an expense. The best you can statistically expect is for your house value to keep up with inflation: 2% per year or so. Any more than this is just luck, and it can go either direction as we've learned since 2005.

So before treating yourself to a house, I'd suggest you go about it the old-fashioned way: save up a 20% down payment, then make it a priority to pay the rest of the balance off much sooner than the 30-year period implied by modern mortgages. The idea of having a house mortgage-free might shock some youngsters who have been conditioned by marketing to think that debt is normal, but seriously – give it a try. The challenge of thinking about saving larger amounts of money – a $50,000 downpayment on a house – is exactly the type of exercise you need as a new MMM reader. If I could do it as a 24-year-old bachelor fresh off the boat after arriving in America, you can too!

On the other hand, if having an upscale house is less important to you, and you get more pleasure from doing a major trip to the mountains each weekend with your friends, then by all means you should outdo Mr. Money Mustache and live at half-price compared to me! When you live in a country with plenty to go around, you DO get to splurge on the things that are important to you. You just have to choose the splurging carefully and keep the total spending down to only 25-50% of what you earn, so you can get ahead and have the opportunity for more luxury in the future.

* Of course, this happens to be in Longmont, Colorado, not exactly a happening metropolis.. but for living a frugal life and having a great environment for a kid to grow up, it’s hard to beat.

The Coffee Machine that can Pay for a University Education

By Mr. Money Mustache

Thu, 12 May 2011 14:24:49 +0000

Now that readers are starting to fantasize about getting a little bit of this early retirement action for themselves, Mr. Money Mustache is getting many questions about the typical expenses people imagine in their future. One of these is "How will I pay for the University* education of my children"?

I must admit, even as the Dad of a 5-year-old, I don't do much thinking about how I'll pay for his education. And I don't think you need to worry too much either. Why? Because once you grow your Money Mustache a bit, this will seem like a tiny amount of money to you. And as with every other expense in your life, it is in YOUR CONTROL.

How much does a College education cost? Some people get big spirals of fear in their eyes and cry out "**Two hundred thousand dollars**!!!" Yeah, in the worst case if you pack your kid off to the most prestigious and expensive private university in the country, he never gets a job or scholarship and no financial aid, and you pay for all his rent, clothes, beer, tuition, and books, it **is** possible to spend this much or more on an education.

But I just looked up some real numbers for my local University of Colorado at Boulder, apparently a pretty fine institution.

University of Colorado at Boulder – ANNUAL COSTS	
City:	Boulder
State:	CO
In-district tuition:	N/A
In-state (out-of-district) tuition:	$6,446
Out-of-state tuition:	$26,700
Fees:	$1,486
Room and board:	$10,378

Hmm.. What I see is $7932 per year for tuition and fees. If your kid is like I was, and is willing to pay for his own education with no loans, and live at home with the parents for free rent and food to achieve this, he can accomplish this with only 528 hours of paid work (3 months at 15 bucks an hour) per year. In other words, working during the summer as a landscaper or painter already pays for your whole education, debt-free.

That's the minimum-cost scenario. Now let's take the maximum cost: out-of-state tuition PLUS room and board. **$148,000** for four years.

Let's say you have a baby right now. You'd like to pay her way in full to Colorado University even though you live in another state. And you don't want her to ever have to work, or get any scholarships between now and graduation at her 21st birthday. No, you don't think this will make her grow up to be a spoiled brat with no work ethic, because look, she's just a cute little baby right now!

You currently work and you and your spouse both like the local Starbucks a bit too much. In fact, you each stop in at the drive-through every day for a coffee and small treat on the way to work. You also stop in on the weekends too. In total, you average $7 each per day** for fancy coffees and the occasional lunch here and there.

You can probably guess how this adds up. This habit, compounded at 7%, adds up to about **$148,000** over the 17.5 years from your baby's birth until she starts university***.

So, just switching to brewing good coffee at home, which I just calculated costs about 10-15 cents per cup if you buy your Organic Fair Trade Espresso roast in 2.5lb bags from your local Costco, will pay for pretty much the whole worst-case education.

And as an MMM reader, you will NOT be incurring a worst-case education cost. Your kid will be a school whiz because you will have time to be home and read with her. She'll earn money throughout high school, perhaps even doing some advanced assistant work for your own part-time consulting career. And she'll probably have a Money Mustache of her own going on by age 17, so she will find ways to spend less than the maximum possible amount on her own education. She'll graduate debt-free and be financially independent before she even has kids of her own at age 30. **A permanent repeating family dynasty of happiness and wealth will be born**.

At this point, you'll invite Mr. Money Mustache out for a decadent sushi meal to thank him for changing your lives.

* I'm always torn as to whether to call it "University" as we did in Canada and the rest of the world, or "College" as it tends to be called in the US. I'll say "College" in this article just since most of the readers are in the US right now and thus it will show up in the search engines more readily.

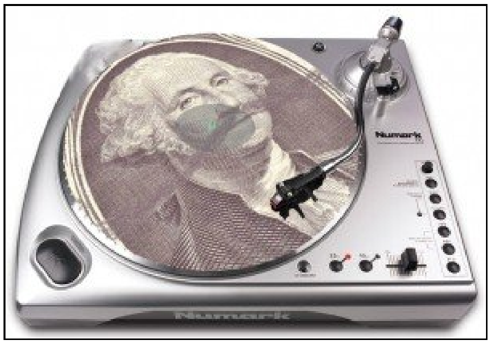
** I admit that having two people each wasting 7 bucks a day is a bit extreme for me to imagine. But to pay for the in-state tuition equivalent, and still the full ridiculous room-and-board, it's less than $3.50 a day.

*** Let's assume that the 7% return is the after-inflation number, as described in "Dude, where's my 7% investment return". This accounts for the fact that university tuition will rise with inflation as well… unless we eventually start taking education seriously as a country and bring the cost back down as other advanced countries do.

How’s the Blog Doing, Anyway?

By Mr. Money Mustache

Fri, 13 May 2011 14:30:49 +0000



Happy Friday everyone. You probably feel pretty tired from the ambitious week of challenges we have done to this point, and perhaps you are still recovering from the complete and permanent loss of visits to Starbucks I imposed on you yesterday.

So today, I thought we could take a break and I’ll let you in on some entertaining facts from behind the scenes.

When you write a blog like this, which I only started doing on April 6th of this year, you get a neat little statistics page that tells you how many people are visiting each day and how they got there.

It turns out this is pretty addictive and even casual bloggers like me end up getting caught up in the nightly report card of how many “reads” you got. Bloggers also read the news and the blogs of other people to get and share ideas, and they post comments wherever they like, and some of these comments lead to still more visitors.

In the last couple of weeks, I was very pleased to receive mention from some like-minded and much more established blogs like Early Retirement Extreme, Brown Girl in the Lane (cycling), Consciously Frugal, and Wake up to Frugality. All of these links brought me an entertaining crew of new readers, so thanks guys! There were also some successful posts to Reddit.com which caused massive spikes in readership, some of which stuck around to read more.

The biggest thing that causes a blog like this to last or fade out is readership – so if readers actually are motivated to click "like" on facebook, or share it on reddit, digg, stumbleupon, twitter, or any other social things they are part of, that starts chain reactions. Once you have enough of these reactions, you get embedded into the very fabric of the Internet itself and Google starts forwarding you thousands readers who are searching for "early retirement" or "frugality" or other common terms. Then you can keep at it and keep having fun for years, because just like Mike Mulligan and the Steam Shovel, you are motivated by how many people are there watching you dig.

A few more tidbits from the scoreboard:

- 5,767 views all-time
- 409 views today (this has grown very unevenly in a line from 0 on the first day to this level today. I think this is very encouraging!)
- 1,157 views on your busiest day, May 10, 2011

The top search terms that led various web searchers to Mr. Money Mustache, and how many times they were used:

Search	**Views**
mr money moustache	20
mr money mustache	14
mr. money moustache	9
mr mustache money	6
mrmoneymustache	4
mr money	3
hasselhoff	2
how many millionaires drive a toyota tacoma	2
money moustache	2
earth logo	2
mister money mustache	2

mrmoneymoustache	1
“too cheap” petrol or gas	1
mr money mustache blog	1
how much electricity do you waist per hour with 100 whattz	1
mr.moneymustache	1
money mustache	1
profitable leisure time	1
wealth, fuck you money	1

how to make mustache in calculator	1
mr. money mustache	1
www.mrmoneymustache.com	1
what if i save 100 dollars a week	1
what does early retirement mean	1
mr mustache retirement	1

Even though only a tiny portion of the readership is coming from the search engines so far, some of these results are Quite entertaining. But why does everyone keep calling me “moustache”? …And if people already know that Mr. Money Mustache exists, why do they keep searching at all instead of just typing in mrmoneymustache.com? Ahh, Mysteries of the Internet World.

Weekend Edition Book Review: The Millionaire Next Door

By Mr. Money Mustache

Sat, 14 May 2011 14:00:29 +0000

 A few years ago, I made my weekly trip into the local library and did a little bit of browsing in the Getting Rich section of the bookshelves (I'm a big fan of the good ol' 332.024 part of the Dewey Decimal system).

I found an intriguing book called *The Millionaire Next Door, The Surprising Secrets of America's Wealthy*, by two Ph.D researchers named Thomas Stanley and William Danko.

Now, regulars on the financial blog circuit will already know all about this book, but for me it was quite a surprise, and it provided a nice mixture of Advanced Mustachian Training as well as affirmation of principles I had suspected were right all along.

Now that a few years have passed and I have become Mr. Money Mustache, I re-read the book to see what benefits I could pass on to you, the readers.

You can soak up the overall message within the first paragraph:
"Twenty years ago we began studying how people became wealthy. Initially, we did it just as you might imagine, by surveying people in so-called upscale neighborhoods across the country. In time, we discovered

something odd. Many people who live in expensive homes and drive luxury cars do not actually have much wealth. Then we discovered something even odder: Many people who have a great deal of wealth do not even live in upscale neighborhoods".

The book goes on through 270 pages of interesting findings by these researchers who actually conducted thousands of surveys of real millionaires around the US. It took them years to do it. The overwhelming results of these surveys show that these people are not Velvet-Bathrobe wearing gentlemen smoking pipes in their West Palm Beach seaside compounds. They are not even Suburban Ultraconsumers with a 4500 square foot McMansion and two Lexus SUVs in the driveway.

95% of the millionaires of this country are, in fact, what you and I would call Senior Mustachians. They all got there by spending way less than they earn, working hard when they had the chance, and looking to all the outside world like they were actually somewhat low-income.

There's actually one of these guys three doors down from me on my own street. One of those well-trimmed-grey-mustache-and-full-beard types with a bald head, silver glasses, and a big smile. He lives in a much smaller house than me, and we talk over the leaf-raking occasionally. This man does all his own home and car maintenance, and is often happily covered in mud and grease. It was only when we got to talking about the fact that we are both out often in our front yards on weekdays, that he revealed he "mostly lives off of the passive income from his 300-unit apartment building these days". Mr Money Mustache shut his own mouth at this point, feeling like quite a silly beginner.

There are loads of amusing individual stories in the book, including one about two contrasting Doctor families each making $700k per year. One of them spends $30,000 on clothing alone and is completely broke, the other one merely spends a moderately luxurious amount on everything and is an ultramillionaire. And inspiring stories about firefighters and secretaries who became millionaires while sharing a $50,000 income.

My personal favorite statistic was the one that over 66% of people driving $70,000 luxury cars in this country are actually non-millionaires.

Millionaires typically spend $29,000 or less on their cars, representing less than 2% of their net worth. If you're not a millionaire yet, your spending should be the appropriate ratio lower, probably translating into a $5,000 car or less!

So when I bike down the street on my 3-year-old $299 commuter bike, wearing ripped jeans and a plaid construction shirt, and someone passes me in a brand new BMW 7-series, I actually get to feel pity for that person and their very-likely poor financial situation. That is true joy.

So if you want some backup tracks to go with Mr. Money Mustache's own rhymes, you might consider checking this book out of the library. The main thing it will do is give you reassurance that I am not actually making this shit up. I'm following a very time-honored formula for making you rich here. The only difference is I'm trying to make things a little more concrete, telling you EXACTLY how you can cut your spending to a level that allows riches, using real numbers instead of sissy guidelines, and weeding out any hidden losses of your precious employees. That way it will happen automatically, and you can increase your odds dramatically above the default 3.5% chance a person has of becoming a millionaire.

Ready to go further next week? OK, see you then.

Mustache on the Move: The Evil Mister Money

By Mr. Money Mustache

Mon, 16 May 2011 04:02:05 +0000

Aha! I see there is an imitator trying to cash in on Mr. Money Mustache's fame.

When biking home from the library today, I passed through the border where the nice Big Trees and Historic Buildings and Cafes part of town degrades to the regular free-for-all capitalism-and-urban-sprawl section which characterizes most of the country.

And there it was, springing up in a building that had sat abandoned for a year or two. Something called Mister Money. Or, Mister M$ney, I suppose, depending on how you are supposed to read that O.

Mister Money is yet another one of those predatory "Financial Services for Financially Self Destructive People" chains, where you go in and ask for a $100 advance on your next paycheck, and they provide it for a $15 fee. If you work it out with compounding, that's only a 3,685% annual interest rate for such a loan!

Of course, all MMM readers will be amazed at the concept of anyone with a job not even being able to make it through two weeks to their next paycheck. Because really, didn't you know how much you were earning BEFORE you went out and bought too much shit? But the concept of entire national chains of stores to service this need, dozens of these chains, each putting up dozens of locations in every crappy little town in the country. THAT is the kind of amazement that just leaves me with a blank, drooling face.

But I have more for you. Check out these choice words from their website:

"Payday loans are a quick easy way to get that emergency cash. Americans do a pretty good job of managing their money, although most of us need occasional help for those unexpected times."

Uh-huh. They sure are "expecting" a lot of "unexpected times" with that many locations nationwide. I wonder if the writer was able to keep a straight face while typing out that little gem.

On the bright side, the commercial property adjacent to this one is still vacant. I'm thinking of opening up my first Mr. Money Mustache franchise right there, and having my sign list the same services. Except when you come in and actually ask for a loan, I PUNCH YOU IN THE FACE AND TELL YOU TO WISE THE FUCK UP AND GO SELL SOME OF YOUR SHIT INSTEAD OF BORROWING MORE MONEY!

That would take care of the educational aspect of my business. I would also do community improvement, which would consist of welding shut the doors of Mister Money, to further protect people from accidentally screwing themselves over with predatory loans.

As my business grows, I can expand into the areas of Auto Finance and Credit Cards as well. Would you come work for me?

—

Amusing Update: *After I wrote this article, it was apparently translated into British and appeared on a blog called "Simple Living in Suffolk". I found out when the author linked to this article from his own! You can read the results here.*

MMM Reader Case Study: The Man who didn't Realize he was already Rich

By Mr. Money Mustache

Mon, 16 May 2011 14:48:46 +0000

This week, Mr. Money Mustache was honored to answer more calls for help from his readers. There was one in particular who had an interesting situation, and was generous enough to let me share it with you (anonymously of course) after we were finished the email discussion. We'll call the reader SAM – short for Surprisingly Advanced Mustache.

Check this out and see if any of it sounds similar your own situation:

Age: 41.
Family: 2 parents and one young kid.
Desire: To enjoy some form of Mustachian early retirement.
Fear: He did not feel he would be able to accomplish this until at least age 65 based on his current situation.

Current Spending Situation:
Salary: $70,000 annual (one worker, one stay-at-home parent)

Living Expenses: $2351 including mortgage at $1250
Remaining Mortgage Amount: 140,000

Current Saving Situation:
Retirement Account Balance (401k/IRA): $300,000
Emergency Fund or Rainy Day savings: $80,000
Annual Savings Rate: About $28,000 including 401k, IRA, and additions to the Rainy Day Fund

What do you think? Is Sam almost ready to for Early Retirement, or still 25 years away as he fears? Let's find out right now!

What I am quickly realizing is that MMM readers are all in rather different situations.
For people with high incomes and low savings, the solution is getting people motivated to find interesting ways to streamline their lifestyle.

But many of the self-selected crowd who read an Early Retirement blog like this are already quite frugal. The situation above, for example, describes someone spending even less than we do in the MMM household, for a family of the same size. For these people, the solution might be a bit of financial wizardry. It is at this point that Mr. Money Mustache fires up the Turntable on the right – the one with Ulysses S. Grant from the $50 bill instead of just the $1 Washington platter.

1: Let's look at Sam's retirement balance*. It's $300,000 right now, which is actually a fairly sizable 'Stash. But lest the younger folks get discouraged, this is the amount you end up with if you just let your 401K run with auto-deductions of $1000/month from age 25 to 40 and it compounds at 7%**.

If Sam stops contributing right now, this balance will automatically grow to **about a Million Bucks by the time he is 60,** even after adjusting for inflation. So it is already on-track to be much more than he needs to live on from age 60, for an unlimited time, living only off of the passive income it gains. And not even counting some eventual Social Security income! ***

2: We’ve established that Sam is DONE saving for old-age retirement. Now he just has to get enough money to get from his current age until age 60 when the Million Dollar Retirement kicks in. How much does he need to do this?

His family is living on $2351 per month right now – $28,000 per year. To generate that much income with no work, he would need another $403,000 working at 7%. With $80k in the bank right now and a $28k annual savings rate, he is already **less than eight years away from a full retirement** if he continually invests the early retirement money as he goes along.

It’s actually even better than this – because the assumption above assumes that he uses none of the $403,000 principal to live on, only the investment gains it and dividends it generates. And it assumes he never makes another cent after he retires – I believe most people who retire well under 60 will find they WANT to do some paid work occasionally to keep their minds sharp and to have challenging interactions with other adults.

So here was the final MMM prescription for Sam:

1 – Immediately put your $80,000 rainy day fund into a mixed 60% stock/40% bond fund (adding the bond component makes the return far less volatile – this is important since you will be starting to use this money in less than 10 years and need lower risk). If you simply buy the Vanguard balanced fund (VBINX), this whole step is done with just a few clicks.

You can set up a line of credit on your house, which you won’t actually use, for small rainy days, and of course you can always sell shares of VBINX whenever you want if there is more rain.

2 – Pay off your Mortgage over the next 5 years or so using your $28,000 per year savings rate. Then you are done with mortgages forever. This technically earns less return than just investing the extra money, but if you are conservative like me, you like to be out of debt earlier. If not, just invest extra and pay the mortgage slower.
At this point, you can subtract about $900/month from your monthly budget (the P+I part of your mortgage payment.. you still have to pay property taxes of course).

Your new annual living cost will be about $22,000.

Your VBINX fund will have compounded to about 100k by this point. You can safely withdraw $10,000 per year from that and it will only run out right as your million-dollar 401k fund kicks in. So now you only need about 12k of annual income.

Option 1 – You could drop down to about quarter-time employment, just enough for free health insurance and a thousand or two dollars of easy income per month. Then you'll still be saving a bit each month and you can increase your lifestyle/vacation/college savings budget. (This is sort of my own path, since I still actually *like* to work occasionally).

Option 2 – You could work 3 more years, 'Stashing all that now-unneeded mortgage payoff money to really build up the VBINX early retirement fund and quit entirely.

Congratulations Sam! – you are not 25 years from retirement after all – you'll be sitting on the front porch thoughtfully grooming your Money Mustache on a weekday morning before your young child starts the second grade!

There are two lessons in this story:

Lesson One: You can retire a lot earlier than most people if you have moderate living expenses. Even without a million dollars in investments.

Lesson Two: It is really fun to stay just a teensy bit engaged in some sort of business even after you retire. It doesn't have to be in your original work field. But it does have to be fun. This also gives you reassurance that if you ever DO want extra money besides what you have saved, you can always turn it on with a switch.

The Footnotes:

* (for Canadians: 401K and IRA are just synonyms to RRSP). But one key difference is that in the US, these accounts tend to discourage early retirement: you pay a 10% penalty PLUS any applicable income taxes if you withdraw from them before age 59.5. In Canada, the RRSP is open for withdrawals any time – you just have to pay the deferred taxes.

** Since the past 15 years happened to span both a crazy boom and a crazy bust which we're just coming out of, how are the 40-year-olds of today doing? Well, as of May 2011, a $1000/month investor would have STILL averaged just about 7% compounded including the dividends, which have

have averaged 1.84% per year. That is the magic of Dollar Cost Averaging to help smooth out price fluctuations in the long term. But but this is an unusual result so hang in there. The stock market has already recovered most of the losses it made during the Great Recession.

*** Social Security: contrary to popular belief among grumpy people with limited training in macroeconomics, the Social Security fund is absolutely NOT going bankrupt, it will simply adjust to a modestly lower level of payouts than currently scheduled. More on that in a future article.

Get Rich With: Olympic Barbells

By Mr. Money Mustache

Tue, 17 May 2011 13:30:53 +0000

Just over ten years ago, I was happily living in my first house. This house was within easy biking distance of work (9 miles) and the grocery store (2 miles), and walking distance of the city's Recreation Center (1 mile) which I enjoyed visiting for workouts about three times per week.

I was especially pleased with this rec center because the membership dues were only about $25 per month, much less than the private health clubs I had been visiting for the ten years prior to that.

A triangle of the Big Three: all the main places a person has to visit on a regular basis, available without having to drive. What could be more frugal or efficient than this?

But then one day I was doing my monthly stock-up of bulk groceries at Costco, and there was a special item on sale: A full 300 pound set of Olympic plates and bars, including collars, clips, a long bar and a curling bar, for only 99 bucks. Next to this in the display area was a complete bench and squat rack set – a nice bench with adjustable angle, curling platform at the end, and a superb squat rack. Also 99 bucks.

I was only a Junior Mustache at the time, but I could already tell this was a great opportunity. I loaded up the whole system onto a flatbed cart, bought it, and stuffed it all into the 1993 Civic Hatchback to rush home and assemble it.

Because of this $198 investment, I am almost $9,000 richer today. And probably a lot less flabby.

You see, having this simple but complete weight set has allowed me, my wife, and even occasional visiting friends to get amazing muscle-blasting workouts at all hours of the day, on weekends, holidays, during snowstorms, whatever. At a savings of $25.00 per month *each*! And that is assuming that we would never have driven to the gym for exercise, something that would have changed once we moved to our current town.

It's incredibly motivating to have your gym at home too – there are no excuses about not wanting to go out or not having time. You just pick up the barbell and start moving. This feels good, so you put on some music and take up the intensity. Before you know it, you have done a complete workout and improved almost every aspect of your body and overall well being. The convenience is astounding.

I just walked over and did a set of clean and presses in my own gym between typing the last sentence and typing this one, just to prove my point!

If a few pounds of steel is all you need to stay fit, why do our indebted countrymen spend $20 billion annually to accomplish the same thing in more complicated ways like <insert adjective>Yoga, bouncy aerobics and indoor bicycling classes? Why do they burn money in their cars doing unnecessary driving to go to gyms? This has always been a mystery to me.

When I ask around, I get misguided answers like ladies saying "I don't want to bulk up and be one of those frightening women in Flex magazine". Or men saying, "I don't really know how to use free weights, I just want a circuit of machines I can work my way through".

It's wrong, all of it.

If you do the research and read a gigantic pile of fitness books and magazines*, you will come to the conclusion that Free Weights – barbells and dumbells and that's it – are by far the best way to get in shape, lose all your fat, build healthy amounts of muscle, and amazingly enough fix almost every other possible ailment.

Barbell exercise will drastically reduce your later-life incidence of arthritis, heart disease, diabetes, bone loss, many forms of cancer, and all the common old-age injuries. Weight training will make you live longer and healthier. **Every person on the entire planet who still has control over their arms and/or legs should be lifting weights regularly** – no question about it.

On top of that, ladies do not "bulk up" from lifting weights at a regular-person level. They lose fat, gain nicer curves, and accomplish everything that YogaLatesAerobics stuff does, in much greater quantities and less time.

Ironically, this best form of exercise is also the cheapest.

Big gyms spend over a million dollars per location on stupid treadmills with LED television screens and fans built in, powder-coated and padded electronic pistony gizmos that let you wiggle your arms and legs around in strange patterns. And meanwhile, the worthwhile amenity – the barbells, benches, and racks – barely show up on the budget (and they get surprisingly light use too, unless the gym is near an army base).

If your monthly budget has any sort of health club spending on it right now, you should slash it, and take this opportunity to add yet another 10-20 thousand employees every 10 years to your 'Stash.

All you need is a 10 x 10 area of a basement, spare bedroom, garage, or covered porch out back to have a wonderful home gym. Find a big old mirror and set up a radio. Check the book "Arnold's Bodybuilding for men", "Sculpting her Body Perfect" or another suitable title out of your library and take some notes. Shop on your local Craigslist for an olympic-style bar with some metal plates, a combination bench/squat rack, and some dumbells of varying weights if you can find them. These things never wear out, so there is no reason to buy them new. If you have a nearby friend who already works out at home, make a recurring workout schedule and you will both become more motivated.

If you are ready to get in shape but don't spend money on health clubs right now, the decision is more tricky, because I don't want you to increase your spending just yet. You can start with free exercises like taking every staircase you can find, push-ups, and solo skipping in your driveway.

And of course, biking – you are doing a lot of that now, since I published the article – aren't you? Biking is perhaps the cornerstone of this whole operation. And my whole plan to save the Human Race.

If you can start using a bike regularly, all other life accomplishments will flow naturally from that skill and you will join Me and all the Mightiest Mustachian Eagles as we soar daily through the skies above the Grand Canyon.

Are you ready to make another ten grand, feel and look better, and extend your youth by 20 years or so? Good – keep me posted on your lifting!

**From 1991-1993, I worked as a convenience store clerk in high school. During the slow evening hours at the store, I got to read every issue of Men's Fitness, Muscle & Fitness, Flex magazine, and any other nutrition and bodybuilding book showed up on the store shelves. That has turned out to be pretty useful knowledge over the years.*

How to make Money in the Stock Market

By Mr. Money Mustache

Wed, 18 May 2011 14:32:28 +0000

 Okay, admittedly my title for this article sounds like something that you might see in your Spam folder.

But it's also completely accurate, because I really can teach you the best way to make money from the stock market, for life, all in one short blog post.

Okay, I admit it – this is widely available information: I am going to hand out some advice that has been handed out widely before, for many years now.

But the reason I'm still writing is that ignorance still seems to be widespread. Almost nobody I meet in day-to-day life knows anything about investing, the stock market, or big publicly-traded companies in general. Their opinions on the subject range throughout boredom, fear, mistrust, and if they are lucky, curiosity. Or if they are unlucky, bold confidence in their abilities to drastically "beat the market" with their intuition.

Here are three real quotes I have heard from friends over time when discussing the stock market.

"Stocks are just a big roulette wheel.. You can't go out swimming with those sharks on Wall Street – they'll just eat you up!"

"I don't know what my retirement money is in.. I just checked some boxes on the sheet when I started my job, but I don't really understand it".

"I don't really believe in mutual funds at all – I'm dedicated enough to do my own research and I can pick winning individual stocks.. I've got some Facebook, some Google, some Crude Oil/Gold/Pig's Feet/whatever….."

All three of these approaches are understandable, but wrong.

The sentiments are valid and I'm glad that people at least have an opinion, but each represents a lack of knowledge about the statistics that run the whole system. Knowing the nature of the market is the key to being able to invest huge sums of your money over time with the absolute confidence that you're not doing anything stupid.

It's worth gaining this confidence, because investing knowledgeably in stocks has always been an incredibly useful way to secure your own retirement. Sure, it's not the only way, but from what I've seen so far, it's the single most reliable way to build up a nice chunk of money, and then have it live on in the form of a stream of lifetime income, with very little ongoing effort on your part.

To start with the basics – What is a stock?

A stock is a ***slice of a company*** that you truly own. When you own a share, you have the right (but not obligation) to attend the shareholder's meeting for that company, vote on important company decisions, and most importantly, you have a right to a share of any future earnings that company makes. This share of earnings is called a Dividend.

In some companies, especially those that are smaller or are still growing, the company elects (with the permission of its shareholders) to reinvest the dividends to help the company grow its earnings even faster. In theory, this means you will get more dividends in the future. Thus, the real value behind any share in a company is the right to get a never-ending stream of dividends from it.

For Example, the old, long-profitable company Lockheed Martin currently pays a 2.8 percent annual dividend while growing slowly, while Google, fancying itself a high growth company, pays zero percent right now and reinvests all profits for faster growth. When I first wrote this post, Apple was in the no-dividend camp as well, but sure enough they have matured and now pay a little one: 0.6%.

Why do stocks go up and down so much?

The true value of a stock is based on the amount of dividends this stock will eventually pay you, the shareholder, over time. That dividend depends entirely on how much money the company will make.

But nobody actually knows in advance how much money companies will make – they just have a big host of differing opinions. Every day, millions of investors and analysts scurry around and worry about how much money each company will make in the future.

"The Libyan People are Revolting! This will make the world have a shortage of oil, so prices will go up! Oil Companies are now worth more! Buy! Buy!".

"The US economy is slowing down! This means people will drive LESS to the shopping mall and buy less gas! Oil demand will go down and oil companies will make less! Sell! Sell!

It's a neverending din like this, for every single stock, on every single stock exchange, throughout the world.

If stocks are so crazy, how can I make money off of them?

Because in the LONG run, it turns out that all this speculation and volatility always cancels out to absolutely zero.

The value of stocks will go up as the earnings of the underlying companies goes up. A portion of the ongoing earnings will always flow to the shareholders as dividends. And all this happens because of the natural ingenuity of hardworking humans making things at a profit, and continuing to advance our knowledge and technology and make us all more productive in every field.

There may come a time when we can no longer advance, but based on the fact that we're still driving around in gas-burning tanks and Home Depot is still doing all of its computing on green-on-black mainframe computers that kick you back to the beginning of the order if you make a typing mistake, I'd say we have at least a lifetime left to go in this department.

So, stocks go up and pay dividends over time, and they have since the beginning of modern commerce. The total return has averaged a very lumpy but fairly dependable 10 percent per year before inflation, 7 percent after inflation.

5 of the 7 percent comes in the form of rising stock prices, and the other 2 comes from dividend payments directly from the company to you. When you're in your 'Stashing stage, you just let these dividends automatically reinvest in more stocks which creates a nice compounding effect.

But WHICH stocks do I want to buy to make this free money?

This is the easy part. You buy ALL of them.

The best minds in finance have done countless studies on this for over 40 years. What they find is that the best way to make money in the stock market is to **simply buy an "index fund"**, which is a mutual fund that automatically buys appropriate ratios of every major stock in your country's stock market, with no magic and guessing of which stocks are better than others.

The reason the index fund wins statistically is because it can be run by a simple automated set of rules – no need to pay 350 million dollar salaries to the hotshot traders running the "Aggressive Growth Fund" down the street. Because there are millions of people, both smart and dumb, squabbling over the value of each stock, the Index Fund benefits and suffers from all the individual stock performances. But overall, you get the **average performance** of all this squabbling.

If you descend into the pit and try some squabbling yourself, you may come out ahead or drastically behind the average, but as it turns out, you can't predict in advance which squabblers (including yourself) will win and which will lose. All you can predict is that your **average** performance if you buy enough of these funds will be equal to the return of the market as a whole, minus the amount of fees your mutual fund charges.

So by picking the **index fund with the lowest fees**, you automatically win. Endless statistical analysis proves this again and again. If you don't believe me, read the book "A Random Walk Down Wall Street, or look up the topic of John Bogle / Bogleheads / and the foundation of the Vanguard company itself.

But my uncle bought some stocks once and sold at a big profit! Also, if index funds really are the statistically best bet, why are there still thousands of brand-name mutual funds and hotshot traders out there?

For the same reason that Las Vegas still exists and people still drive SUVs.

Humans are irrational creatures and it is scientifically proven that we overestimate our own investment (and gambling) abilities, and no presentation of knowledge to the affected people can completely erase this. I have some perfectly intelligent friends who still believe they are "lucky" at games of chance, even though any scientist in the world can quickly run an experiment to irrefutably disprove the existence of any form of luck.

The only tool you can truly use is statistical probability, and by buying the market average and lowering your investment costs, you are improving your statistical chances.

OK, Fine. Which Index fund do I want?

There is one king index fund that makes the decision easy for you. **The Vanguard Total Stock Market Index Exchange Traded Fund (VTI)** tracks the entire US stock market index.

Its expense ratio is 0.04%. This means that for every $100,000 of shares you hold, they subtract $40 per year from their gains to pay for their offices and trading costs. Some funds charge 10-20 times higher fees. So if you are looking over employer-sponsored plans, try to find a total stock index fund (or at least its close cousin the S&P 500 index fund), and compare the expense ratio to 0.04%.

What is the S&P 500?

This is basically a list of the 500 largest companies in the US, and therefore in most of the world. They are all multinational companies, so they benefit from growth around the world. If you really want to invest without having to worry, the S&P represents good odds. If you buy the stock market index of a smaller country, like Canada, you will still have good odds, but at higher volatility. (During the dot-com boom of the nineties, a company called Nortel once represented 70% of Canada's entire stock market value. This company is now bankrupt, so you can imagine how that felt to investors solely in the Canadian index. Later, Canada became the new Saudi Arabia with oil exports around 2010, so its index started riding high on oil company stocks. More recently, oil is looking like it won't be our main fuel forever, so am glad I didn't bet my whole Mustache on that one commodity either).

What about International stocks?

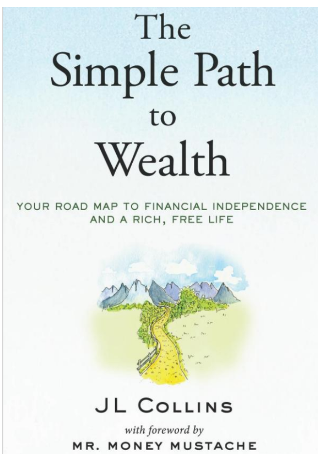
Some people like to get fancy and buy international index funds, which can do well when the US is hurting (as it has been recently). This is fine, as long as you understand that it's just another form of trying to outsmart the basic stock index.

When you do this, you are stating that you believe the stock markets of the other countries are more undervalued relative to future growth, than the US market is. The US is traditionally the most business-friendly country in the world, so its stock index has tended to have the highest performance, after taking into account its lower risk and volatility compared to, say, throwing all your chips onto Russia or China.

It may or may not pay off in the future – I just want to point out that most people just make this decision on a whim, something like “China is so hot right now, they’re taking over the world!” . Whereas to actually justify international investing rationally you’d have to be a very sophisticated investor and truly understand WHY you are doing it.

So there you have it – in two words: Vanguard.com, and VTI. In Canada, check out TD Waterhouse and their own series of funds, and let me know if you have any questions about what you find there – MMM has a Canadian Investments Expert Panel that can help us out.

Update: Read this great book to get a deeper understanding



A few years after writing this article, my friend JL Collins wrote a really entertaining *and* educational book that teaches you just how simple stock investing (and money management in general) can be. The book was so good that I accepted his request to write the foreword, and even *narrate* my own part for the Audible version that came later! The book has been a big seller in recent years in multiple countries and languages, and for good reason: It’s good information in an easy-to-read style.

Invest!

Mr. Money Mustache vs. Dave Ramsey

By Mr. Money Mustache

Thu, 19 May 2011 14:30:24 +0000

 Being a newcomer to the financial guru circle, Mr. Money Mustache decided to check out what his competitors have been saying throughout historical times to see if they have their stories straight. So he spent a recent weekend listening, in full, to the audio book version of Dave Ramsey's ultimate career work: the Total Money Makeover*.

As a disclaimer before I launch into the comparisons, Dave Ramsey seems like a good guy whose work has improved the lives of many people. He's already rich, but he continues to tour the world and sell motivational products to people and make even more money. Mr. Money Mustache will NEVER appear on infomercials or try to sell you books and CDs. He's already retired, and that would be way too much non-fun work. So I wish to arouse no wrath from any of his lawyers.

But fuck, what an annoying audio book that is. I'd never heard of this Dave Ramsey guy before becoming a public figure myself recently. But it turns out he is this Southern Preacher-type guy who has had a talk radio show for many years. He yells a lot when delivering his material, and sprinkles in plenty of biblical quotations and references to the interventions that god(s) make into the financial affairs of deserving subjects. He likes to repeat a small group of mundane quotes over and over, while chuckling to himself as if they are funny. "Because if you live like no one else today, you'll get to live like no one else later!". And he inexplicably repeats the incorrect statement that the stock market averages returns of 12% per year in all of his examples.

So how does the Mr. Money Mustache target audience differ from that of Mr. Ramsey? I'm crediting Junior Mustaches as being a bit more adult than the folks needing the "baby steps" in his plan. You don't need be slapped around to get your first $1000 available for tiny emergencies like a water heater replacement.

You are already making enough money and paying your bills.. you've got some self discipline. You're just wondering how you can get some actual RICHES going on and have the option of having some more freedom in the not-too-distant future. And perhaps you like the funky rhymes that Mr. Money Mustache writes more than what spills from the keyboards of the other MCs.

What else do we do differently here? Well, I think the way of the 'stash is different because I've **never used any kind of budget.** Never in my life. It seems inefficient to me, and a possible stumbling point because really, who can remember to do a chore like that every month? I believe budgets have worked for many people. But I have had greater success breaking it down to a much smaller level: the individual transaction. As a Mustachian you will learn to THINK before you make EVERY money transaction and optimize that transaction right at that moment. In short, you just don't buy ANYTHING until you've really thought about it. This eliminates most purchases outright. Then you optimize the remaining purchases so they cost about 75% less than normal whenever possible.

For those wanting to wade in to test the waters and still see immediate benefits, I'll present ideas for optimizing EACH AREA of life's spending. And a few for income. You can adopt each one, and win, or ignore it, and not win in that area. Assuming you are currently getting by with very little savings, your savings will increase based on the number of changes you make. If you make them all, you'll be rich in just a few years, woohoo!

This sounds simplistic, but it works because this country is so rich, and so cheap, that even on a minimum wage income, you still have enough to buy food and shelter. And as someone smart enough to be reading Mr. Money Mustache right now, you're probably earning much more than the minimum wage. That allows you to add luxuries like an efficient used car and carefully spaced extras like entertainment and toys, while still keeping MOST of your money for kickass saving and investment.

The other thing that Mr. Money Mustache will not do, is say things like "God brought a Jaguar back into my life" and "God tends to pour blessings on people going the direction he wants them to go". (These are actual quotes from the Dave Ramsey book, by the way). I think we get enough religion by just listening to the political debates, and when it's time to get rich, we do it using Solid Mathematics and Occasional Manly Swearing.

That's why here, we maintain a separation of Church and 'Stash.

Because we're using Math, for example, I'm not going to tell you to pay off your smallest debts first as with the Ramsey "debt snowball". I'm going to tell you to pay off your highest interest debts first. And I'm not going to tell you to cut up your credit cards and that you can't have a home equity line of credit. I think these things are GREAT – but you will use them with the same discipline as if you were spending crisp cash freshly pulled from the Lips of a Cute Baby Angel. You must love your money and feel great pain every time you lose it by spending instead of keeping it by investing. And because you love it, you must always put it to work in the most efficient way possible. That is my specialty. Thanks for choosing Mr. Money Mustache.

*Don't worry, I didn't actually *buy* something like that at 30 bucks, are you crazy? Just borrowed it from a friend.

It’s Beer ‘o’ Clock

By Mr. Money Mustache

Fri, 20 May 2011 14:30:23 +0000

With this being Friday and all, I figure it’s a good time to address a tricky issue. A place where the Good Life we advocate here at MMM comes into direct conflict with optimizing your spending. That place is BEER, and other recreational drugs of your choice.

Mr. Money Mustache definitely enjoys a good brew. And a good jug of wine occasionally too. And a strong Espresso in the morning. And even a pipe packed with Colorado’s Finest Legal Marijuana if it should happen to present itself. Which it tends to do when I open my drawer full of marijuana supplies.

I admire those who choose to abstain completely from these substances, but for me it is worth a certain amount of money and health risk to experience the altered states of consciousness that bring Introspective Voyages, Creative Breakthroughs and just plain Really Good Times. But only in a mathematically determined moderation that ensures that the Good Times will never cause Bad Times.

Let’s focus on alcohol for this article, since it’s the habit that most commonly gets out of control among humans. What is the maximum amount you're allowed to enjoy? How can this be had without compromising health or early retirement?

Mr. Money Mustache, while possessing no medical qualifications of any sort, is still going to tell you what to do:

I think that a beer-and-wine-loving person should consume no more than what is required to get good and drunk, once per week. Preferably much less, but hopefully we can all agree that if you actually care about your health, you should not get drunk more than once a week.

So, about 6 drinks is your allowance. 6 beers, or 6 glasses of wine, per week. You can space it out all civilized-like with your dinners, or you can have a bender tonight. You're also allowed "rollover beers" if you don't use them all up in a given week. If you shop wisely, you can get this amount of good quality drinks at about $1.50 per serving, so your total drinking budget is $9 per week.

This is still a hell of a lot of money, $6912 over ten years with compounding, so I encourage you to optimize it further and drink less. But it is a budget that will keep you from destroying yourself and/or burning off your Money Mustache.

But for some of you, Nine Bucks is sounding a little bit challenging, isn't it? What if you're sitting in Las Vegas or a Cruise Ship, and the stupid drinks are $14.00 each?

The answer is simple: **You don't get suckered in by shit like that, ever!** As an MMM reader, you have learned to love and appreciate each of your dollars, your employees that will work for you for life. So the very idea of anyone trying to **steal** fourteen, or even four of them, for a beverage that is only worth a maximum of $1.50 should be offensive to you! When I go to a restaurant, I'm there to marvel at the skill of the chef, making me food that might take many hours to produce at home. That has value. There's no added value in somebody taking a beer out of a fridge and handing it to me. So why do they think that service is worth a 200-1000% markup?

If you do decide it's worth $4.50 for a pint at the expensive brewery downtown, that's half your budget used up for the week. So you have to weigh the options and decide if you'd rather have three wonderful cold ones on your own patio with your friends, or settle for a single in the restaurant. Don't forget tax and tip.

Back in my university days, cash was short enough in my town that people actually thought about their alcohol spending. I remember the pre-parties that would be had before going out to the pubs, so that fewer drinks would need to be purchased there. I remember secret bottles stashed in pockets and plenty of similar fun that also kept students from having to resort to student loans. But even back then, I could see the savers and the spenders beginning to separate, when some of us would bring a $10 bill for the night's bar tab and come home with $7, and other people would drunkenly blast out $100 of their borrowed employees in the name of a good time. Some of those hundred-dollar nights are surely being paid back by thirtysomethings to this day, who complain how hard it is to save for a house downpayment and take care of student loans at the same time. Talk about a long hangover!

This article is just to remind you that there's more than one kind of good time out there, and the Good Times that you get from being free of monetary worries for life are *way, way better* than the good times of buying a lot of drinks in a bar.

And with that thought, I think I'm going to head out to my back yard and use up about half of my weekly budget right now.. Cheers!

Update! After writing this article, I went on to start brewing my own beer for further fun and profit. You can read about the results in the articles called: "A Mustachian Microbrewery is Born", and "Brewery Update: Beer ready, Critics Raving!"

Weekend Edition: What would the Native Americans Do?

By Mr. Money Mustache

Sun, 22 May 2011 15:00:06 +0000

 One of my secret tricks to figure out what activities are really worthwhile in life, is to look back to the Original and Ultimate Mustachians of this continent – the Native Americans.

These were a people who lived together in a very rich culture which was based entirely on their natural environment. The animals and plants and the weather became gods and spirits to them, and their religion served as a guide to practical living in a way that kept everyone healthy, including the surrounding ecosystem.

They felt respect for the animals they killed and used every available part for food, clothing, housing, and tools. This common understanding of their Earth gave the people something healthy to focus on, and allowed them to prosper for thousands of years while leaving a very light footprint.

While I rarely wear a loincloth myself these days, I still think there is much to be learned from the original way of life. These people were BAD ASS, for starters. Imagine being physically fit and with extreme physical skills you put into use every day. Like running for eight hours while tracking prey, shooting an arrow from a bow you made yourself to fatally hit a moving bear in the EYE and bring it down before it escapes or eats you. Or inventing ways to get you and your tribe through a Rocky Mountain winter using only things you harvested from the land with your own hands.

And then there was the music and dancing. This was an actual part of the community – men, women, and kids ALL singing and making some truly funky beats around the fire, *way* more often than we get to do it these days, unless you're lucky enough to be in a band.

Badassity has its own rewards – becoming truly great at something difficult brings a deep happiness that Cable TV can never match. When you cultivate a real physical or mental skill, it becomes one of the burning coals in your soul, or a glowing golden strand in your Mustache, one of the things that defines who you are and gives you confidence that you can accomplish other difficult things. Instead of running from challenge, or spending money to avoid it, you actually enjoy and embrace challenge more and more. This becomes a virtuous circle and you gain even more confidence. Thus, it can be said that Badassity is Happiness itself. And Happiness is the real point of Mr. Money Mustache himself.

The Natives knew how to have a rich and healthy life while buying Nothing for thousands of years. So while you and I are pretty much stuck buying things these days, we can still embrace our inner **Badass Native Spirit** when making decisions, and start to become a bit more Naked and Muscular about everything we do.

Yes you CAN ride a bike to work, even when it's winter, because that makes you more Native and thus more happy. You CAN find a new job that's closer to home, or a new home that's closer to work. Because that's effort that makes you stronger and happier – both the effort itself and the rewards that it brings. You can also clean your own house, mow your own lawn with a non-gasoline mower, and lift olympic barbells with your own hands and using knowledge you learned by reading a book with your own eyes. You can trade and barter with other real humans in your community by buying and selling things used, instead of just driving to a store every time you need something. All of this is simply an expression of becoming a more Native-like and Badass person, and to become rich and retire early, you *MUST become BADASS*.

It takes effort, but the good news is **this effort itself is a gift** that makes you become happier and sleep more soundly And the Canyon-Filling Money Mustache it brings, as awesome as it is, is only a side benefit.

As you kick more ass over time, tell us all of your accomplishments in the comments!

Get Rich With: Owning Rental Houses

By Mr. Money Mustache

Mon, 23 May 2011 14:33:50 +0000

We're diving into a fundamentally new field here – the field of actually **increasing your income**, which is quite different from the **cutting your spending** I usually advocate.

For most people, the cutting works much better because they already have a shortage of free time, and a surplus of income compared to what is actually needed to live a reasonable life.

But for those rare people, perhaps the young and ambitious, or those without children who need all of your free time, it is possible to raise your income considerably while keeping your day job by using the time-honored method of *becoming a landlord*.

To some people, it sounds like a hassle not worth even considering. To others who have read the Get Rich books on the topic or met a self-made multimillionaire who became wealthy using rentals, the idea is intriguing and desirable. As a small-time landlord myself who has rented out four houses over the years and still has one rental today, I would say the truth is somewhere in between.

Here is a real-world example with some numbers showing the fundamental reason that these things make you money:

– In my town, I can buy a 3-bedroom house in a fairly good neighborhood for about $200,000. I would put $40,000 down on it, and because of of today's insanely low interest rates, my monthly costs for the $160,000 loan including insurance, property taxes, and a few bucks for maintenance would be about $950/month.

– At local rates, I can rent this house out for about $1200/month.

So every month I am getting this benefit:
$250 of actual cashflow from the rental
$230 of principal on the mortgage gets paid off.

The net profit is $480/month, or $5760 per year. That is a 14.4 percent return on my $40,000 investment, right? Double the MMM official figure for stock market returns?!

But no, it's not quite the same, because you actually have to do WORK to buy the house and take care of the tenants. I find that if you do a good job getting nice responsible tenants, the total amount of work required for each rental house averages about 1 day per month, or 96 hours per year.

So your hourly rate of pay is about $60 per hour, right? Well, again not quite, because you would have made half of that money if you had just put the $40k into an index fund at an average of 7%. Accounting for that, you're getting $30 per hour for managing the property, which is still reasonable pay for anyone who is willing to work for $60k or less per year.

But I've left out an important part of the equation: Appreciation on the rental house. Because you only put 20% down on the house, you basically own an investment that is leveraged at 5-to-1. That is potentially risky, as many US landlords found out when the property values dropped in recent years. But on average, the statistics say that over the long run your rental house value will go up with inflation: 2-3% per year. So let's re-run the numbers using a conservative amount of appreciation:

Cashflow and Mortgage Payoff: $5760 per year
Appreciation on House ($200,000@2%): $4,000 per year.

Now you're getting paid $9760 per year in exchange for investing $40,000 and putting in 96 hours. Doing the same stock-market-equivalent subtraction above, you are earning about $72.50 per hour. Unless you make more than $144,000 in your day job, this should start to sound pretty exciting to you. And if you have the skills to expand your empire to include multiple rentals, you can put in quite a few hours at your new $72.50 rate.

If you collect several houses, you can even quit your day job and have a more-than-full-time income for less-than-full-time effort. At $72.50 per hour, you can earn a comfy $40k family living wage with about 10 hours a week of effort. Several people I know have already done this.

If your area DOES ever have a property boom and home values go up faster than inflation, you can make some even bigger chunks of easy money. In my best experience, I made about $50,000 in appreciation over five years on a rental house, and in my worst experience, I lost about $10,000 over five years on another one (I bought that one in the 2005 housing boom and had to sell in 2010, still part of the current slow period).

And if your area has a higher rent-to-price ratio, sometimes referred to as the "cap rate", the plan can be even more attractive. In the example above, the rent of $14,400/year divided by the $200,000 price gives a cap rate of 7.2%. In expensive cities, the cap rate is much lower, making rentals a bad idea. But in some cases you can get a much higher cap rate – it usually works out better the less expensive the dwelling is, which is why condos make good rentals. This economy of scale continues all the way to the ultimate rental tool – the apartment building, which can have cap rates over 12%.

The bottom line is, it's just another way to trade time for money. But if you have the enthusiasm for knowing the good neighborhoods in your own city, finding a good deal on a house, doing minor renovations and maintenance, and interacting with tenants who you reel in with an expertly-crafted Craigslist ad, it can possibly be the highest wage you'll ever earn – and thus the fastest way to get from Enthusiastic Young Office Worker to Retired Senior ‘Stash.

This is just an introduction to the topic. There are loads of books about this in the library if you want to learn more, or if you want to hear more details from me, think up a question for the comments section!

MMM Challenge: Get yourself a lower Mortgage Rate

By Mr. Money Mustache

Tue, 24 May 2011 14:17:22 +0000

It has been a while since we did an MMM challenge, so I've got an extra good one for you today, one which can save many homeowners out there **$105,000 over a 15-year period**. The challenge is: Getting yourself a better rate on your mortgage.

Looking at the ING Direct* website recently, I noticed that home loans were going for an astonishingly low rate of 2.99%. The last time I paid attention to mortgages, it was to refinance my own house a couple years ago, and at the time even the 5% rate seemed amazing to me. The lesson to me was that in this weird financial aftermath of the Great Recession, there are some sweet deals to be had for those paying attention. Any reader who has not recently refinanced to a lower rate should definitely do some shopping around.

But today I noticed there is an even more advanced strategy that has opened up. Check out the current APR spread on interest rates, which you can look up on places like Bankrate, (and also check SoFi – typically better loans without an origination fee).

5/1 ARM loan: 2.972%
15-year fixed: 3.604%
30-year fixed: 4.410%

These rates include all fees as part of the APR number, so when comparing to your own interest rate, it should be equivalent to getting the rate above and paying no fees. Lender fees are silly and are often way too high from less reputable lenders. ING Direct seems to have some of the lowest loan fees overall. But again, the rates above supposedly are the effective rate over the life of the loan after including the fees.

Before I became mortgage-free this year, my strategy was always to go for the 5/1 ARM mortgage. That way you get the lowest rate for 5 years, and you can really go crazy paying off principal of the house because your interest cost is so low. If the rates start to creep up at the end of the period, you can always lock in for a longer period at that time.

Some people, out of fear of the unknown, like to go for a longer lock period. Thus in the United States, the 30-year loan is very popular. The issue with 30 year loans, however, is that **they are stupid**. They are deliberately designed so that you start off juuuust barely paying any principal at all, $263 per month on a $200,000 loan, so that you really just scrape along in debt for a good part of your lifetime. It is so close to the tipping point that if you cut the payment just $200, it would be a 100-year loan. A few dollars lower, and it would be an infinite-year (interest-only) loan. Going a few dollars higher, on the other hand, gets you out of debt drastically sooner.

Now, certain Advanced Mustachians will point out, “But I prefer an interest-only loan, because I can choose when to make principal payments on my own schedule. Of course I won’t really take 30 years to pay it off, but since the interest rate is low I want to stay leveraged to make bigger investments in stocks instead”.

OK, fine, for those people the 30-year is fine in some cases. But still not in today’s market. Because look how much lower the rate is on the 15 and 5 year mortgages!

Let’s say you have a mortgage right now: $200,000 at 4.5 % on a 30-year schedule. Your monthly payment is $1013/month, of which 750 is interest and 263 principal.

If you are too conservative to switch to a 5/1 loan, then I still recommend that you go out tomorrow and refinance your loan into a 15-year fixed loan instead. You don't have to worry about interest rates going up after 15 years, because YOUR HOUSE WILL BE PAID OFF THEN!!

But can you afford the payments?

Surprisingly, because of the lower interest rate and the stupid almost-infinity nature of the 30 year mortgage, **you can easily afford them!** Check it out:

The monthly payment on a the same $200,000 mortgage with a 15-year schedule at the much lower 3.604% APR is only **$1439!** Only 426 bucks a month more, and all of a sudden your payments are doing this for you: $839 principal, $600 interest.

You're paying $426 more per month, but your interest costs have actually dropped by $150 per month and your principal payment has more than tripled. Congratulations – you're actually paying off your house, sukka!

Over the lives of the two loans, the 30-year holder will pay $165,000 in interest, but YOU will only pay $60,000 in interest.

I think almost everyone can find a way to scrape together $400 per month when such a wealth-building opportunity is at stake.. right? The frugality tips alone that have been shared by Mr. Money Mustache in the past month have already freed up more than that amount of money. Cut your cable TV, drop to a less expensive car, ride a bike for local errands, drink less beer, stop buying coffee outside the house. You're already more than there.

If you still don't agree, feel free to stop by my new retail location next to Mister Money on Main Street in Longmont for a complimentary PUNCH IN THE FACE!!! Because it might help instill some wisdom that is already quite obvious to me : $105,000 in additional wealth** over 15 years is worth working for!

****Some Fancy Math on the issue:**
Using a simple mortgage calculator and fast forwarding to the end of year 15, the two examples above would have you in these positions:

30 year mortgage holder:
-paid $1013/month for 15 years
-has $182,000 in payments remaining to go.

15 year mortgage holder:
– paid $1013/month for 15 years PLUS an extra $426 per month
– $0 of extra payments to go
– this $426/month has saved them $182,000 of future payments.

Note: I had to change this footnote after an astute reader pointed out it was confusing. Because these payments are stretched out over a long time, the actual equivalent return you're getting on your $426 payments takes a bit of work to figure out. In the comments, you'll see that I came up with a figure of 6.78%. Still quite amazing for a guaranteed investment return, so **Do it!!**

A Road Trip to Early Retirement Extreme

By Mr. Money Mustache

Wed, 25 May 2011 13:09:12 +0000

Today is actually a special occasion – Mr. Money Mustache's first Guest Posting on another blog.

The wise and benevolent writer of the Early Retirement Extreme blog, a guy named Jacob who also retired in his early 30s and has been running that site for several years, allowed me to write a "hello" to his own club of financial freedom enthusiasts.

By the look of today's readership stats, there are thousands of us. Maybe we *can* change the world!

Here's the post: The quest of financial bloggers to Save the World

many thanks again to Jacob!

What is the Real Cost of Raising Children?

By Mr. Money Mustache

Thu, 26 May 2011 14:30:14 +0000

Despite the reputation Mrs. M and I are cultivating as extreme nonspenders, we do indulge in the ultimate luxury: being parents. Our lovely little boy brings us happiness and learning every day and as with all parents, we feel the experience of parenthood is worth the cost. Whatever that cost might be. Hey.. what exactly is that cost anyway?

The interesting thing about the answer is that there IS no fixed answer. When you research this topic, the cost is usually listed as a percentage of income. And whenever you see anything listed as a percentage of income, you should start getting excited, because it means there is wasted money in the air. Hundred dollar bills swirling this way and that, which you can catch for yourself in your own Money Mustache.

The cost of raising a child can range all the way from less than zero (if you live in a rural environment and can get your kids to help out on the farm as they did in the olden days) to millions of dollars if you own the Hilton chain of hotels and your children run wild over the world on your credit card. Middle and high income people tend to say that taking care of their children is very expensive, but when you dig right down into it, these people are mostly just being suckered into Consumertown by the amazing amount of marketing that tries to sell products to desperate parents. Or even worse, using their children as an excuse to buy things.

To figure out the true answer, you have to go to a quiet room or a forest, close your eyes, and take a few deep breaths. You have to imagine what a child really needs when growing up. What is truly the ultimate upbringing we can provide for our kids? Only with your eyes closed, with none of the noise or images of the Consumer World leaking in, can you truly start to realize what is real in parenting and what is a distraction. As the answer comes to you, you might start to shed a few tears.

Kids need to really *know* their parents, and live in a warm and loving environment. And not just furnace-warm, I'm talking about skin, soil, and sunshine-warm. Kids will thrive when they live in a forest of the arms and legs of their parents and siblings, and when their most prized playthings include dirt, water, rocks, and plants. They grow when they learn by observing the laughs and singing and patiently resolved disputes of the family and friends around them.

They will suck up the advanced knowledge of modern human civilization – things like literature, science, music, art, and math – if their parents live and share these principles as part of daily life right at home – in that chaotic forest of warm skin and human voices.

Humans are just smart animals, we're part of the Earth and we have evolved to be one with the planet that made us. We, and our kids, will thrive when we embrace the natural world, and our bodies and minds are at their best when we use the Earth for our education instead of trying to pave it over and overpower it with plastic substitutes to meet the same needs.

The Treehugging words above are there to convince you that giving your TIME to your kids is actually worth putting some effort into. And keeping your time is the opposite of spending your money. So every time you spend money buying THINGS under the pretense of doing what's best for your children, you must weigh that against the guaranteed cost of your young children getting less of their parents. I'm serious, you have to weigh every…single…thing and think about it. It should hurt at least a bit.

For example: does your baby benefit from being left to fend for herself at a day-care when she is still too young to even speak? Do your diaper-clad toddlers really benefit from the early-dropoff and late-pickup options offered by the preschool so the parents can work extra? Do your kids really care whether they ride around in a thirty thousand dollar car instead of a five thousand dollar one? Is that worth saying goodbye to mommy for an extra year of their childhood?

Let's imagine that I have convinced you, and you are ready for a change – you are a young parent ready to do a complete 180 – to try to strike a balance between having time to actually parent, and having the material things needed to do so. So given that, how can you start?

1 – Start with the assumption that it is NEVER necessary to have two full-time jobs to pay for raising kids. Many people make the wrong assumption because they have been sold the consumer myth that "times are harder now". They are not harder. Plenty of families with kids, including mine, live a perfectly good life on the equivalent less than one average salary. Instead of two full-time salaries, plan for one, or even better, two part-time ones if both parents want to have time to be real pillars in their kids' lives.

2 – Think about every kid-related purchase logically instead of emotionally. Instead of browsing through Target looking for things that might be nice, stay home with your kids and only plan for purchases once you realize definite needs, like outgrown shoes or socks with holes in them.

3 – Realize that you are not the first person on Earth to have a kid. Thus, almost every possible product you need is already out there, waiting to be handed down for free or sold used. View "Used" as the normal way to get everything for your child, and "New from the Store" to be the exception – something you only do with regret when the used option fails.

4 – New and Expecting Parents – don't fall for the disposable diaper myth! This deserves an article all in itself, but in summary, disposable diapers are not any easier than modern cloth diapers. When you have a baby, you buy a Dozen Fuzzi Bunz cloth diapers or a competing brand, new or used if you can find them, and you wash them in a high-efficiency washing machine and hang them on clothes hangers to dry. You save way over a thousand dollars per child, and prevent a huge dumptruck load of crap-laden toxic waste from pouring over your child's world. When all your children are done with the Fuzzi Bunz, you can even sell them used for a good portion of what you paid.

5 – Drive less. You are endangering your kids when you drive them around town unnecessarily, and you are burning up the very money you could be using to spend time with them. There is no need for a child to ever be part of a fender-bender in a shopping mall parking lot, because there is no real reason for anyone, parent or young child, to ever visit a dedicated shopping mall.

Having said all of this, the final answer to the question is that as a family who does a moderate job at being natural and nonconsumer parents to our child, we find that it cost less than **$300 a month** to have a very young child from age 0-2. Cloth diapers, food, the odd piece of clothing we couldn't get from hand-me-downs, the occasional stroller, car seat or baby toy, doctor visit, etc.

Then we started some one-day-per week preschool at age three which ramped up to three days per week by age 5, to get him ready for the routine of kindergarten. This has by far been the biggest expense, at several hundred dollars per month.

As he grows older, the average cost will drop again since public school is free and doctor visits are now very rare. But if we round up the spending estimate to assume a continued $300 per month until he reaches age 21, that yields a total childraising cost of about $75,000. Not bad at all, less than a year's salary for an engineer, and you get a whole lovable and productive adult out of it!

As for paying for University tuition – there's enough fat in that $300 number to give our son a nearly-free education if that is desired, but that topic deserves its own article, like this one.

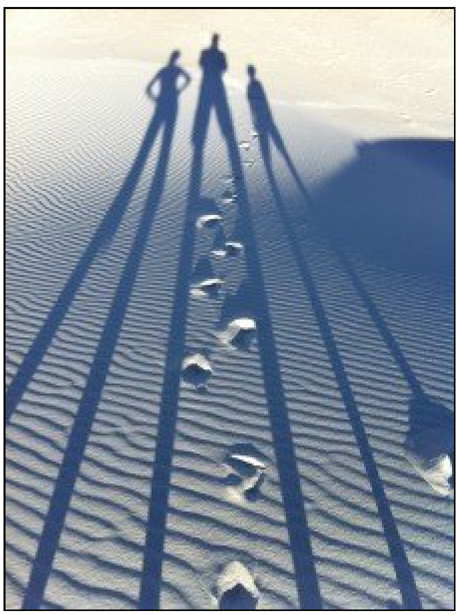
We will still provide whatever it takes to give him the best upbringing we can possibly give. It's just that by thinking carefully before buying products in the name of being better parents, we are giving ourselves more time to actually work at being better parents.

We could have spent a couple million more on parenting to this point, but so far, seeing how well he is turning out without leading the typical rich kid lifestyle, I am thrilled with this more Native approach to childraising.

Exposed! The MMM Family's Actual Spending

By Mr. Money Mustache

Fri, 27 May 2011 19:27:39 +0000



Mr. Money Mustache is a bit of a Natural Frugalist. For me, buying anything beyond groceries is like giving birth, where there is great thought, planning, and nine months of physical stretching and pain involved before the actual wallet emerges slowly from the pocket.

Because of this, I find that I spend very little when left to my own devices, and the resulting trail of credit card statements is quite boring, not really worth adding up or reviewing. The real fun is in trying to get the net worth statement and the investment accounts to look better over time.

But now I'm a family man. There is MUCH more money being spent these days, with things like family vacations, doctors and dentists, preschool, charitable donations, special kinds of food for fussy eaters, and who knows what else. THIS type of spending IS worth adding up to see where a new parent's money is going.

Luckily, Mrs. Money Mustache a bit of a Spreadsheet Ninja. We don't use a budget for our monthly spending, but when I set her free on the credit card statements, she rapidly parsed a year's thousand little transactions into a fantastic categorized list to see how much we actually spent last year. Since we put pretty much 100% of our spending on a nice high-cash-back credit card, it makes things quite easy to track.

Ahh, the year 2010. Our most expensive year to date, due to feeling rather relaxed with money. But it's OK – we had already fully reached our early retirement goals, yet we continued to do some fun part-time work. If we were still fighting to grow the 'Stash, these numbers would be a bit lower. But regardless, let us now Check-checkitout…

Mortgage Interest $3,625 (in 2010 we still had a mortgage and the $1135 payment reflected a what was originally a balance of $212,500 with a 30-year amortization schedule. Since the mortgage was mostly paid off by 2010, most of this was principal, however, so the interest portion was only $3625.)
Childcare/Preschool/Elementary: $6,665 (this drops to $2,500 next year for full-day kindergarten – hooray!)
Travel: $4,151 (hey, we have a lot of free time and spent almost 3 months visiting family or Sunny Southern destinations last year. But this year also included a trip on a Cruise ship. Educational for one trip, but far too cheesy and commercial so we will not be repeating.)
Groceries: $3,855 (including while traveling since we buy most travel food at grocery stores. Mostly organic when possible, but meat-related stuff is not a big part of the diet)
Property Taxes: $2,292
Miscellaneous: $2,420 (including a digital camera, local art and swimming classes for the kid, clothing, shoes, household products, bike parts, an iPhone, etc.)
Home renovations/repairs/landscaping: $1,819
Utilities: $1,260 (Gas, Water, Electric, Trash+Recycling)
Health & Fitness: $1,080 (the Mrs. is part of a very non-Mustachian

fitness gym called Crossfit @ $135/mo. A reward for retirement, I suppose.. sigh. I am still content with my plain old barbell set.)
Gas: $777 (inc. driving trips to Canada and the Gulf of Mexico)
Home and Car Insurance: $707 (home has 5k deductible, car is liability-only)
Restaurants & Bars: $524 (much of these during vacations)
Charitable Donations: $374
Medical/Dental: $366 (2 copays, 1 urgent care visit, 1 pediatric dental visit)
Wine & Beer: $269
Auto Services: $32 (5 quarts oil, a filter, and windshield wipers)
Cell phone: $120 or $10 per month (the Mrs. negotiated a company-paid cell phone so MMM tags along for an extra $10 on a family plan ;-))
Mother's Day Garden Plants: $77
Coffee Shop: $41
Magazine Subscription (OwlKids): $30
Driver's License Renewal: $22
Movies: $18 (the Mrs. went to 2 movies with the ladies)
Used books: $8
Internet Service: $0 – again paid for by a part-time employer. Otherwise this figure would be about $400 per year.
================================

Total of Everything: $30,500
Total excluding Mortgage: $26,885

Estimate for next year (no mortgage, child in elementary school, no cruises): **$21,695**.

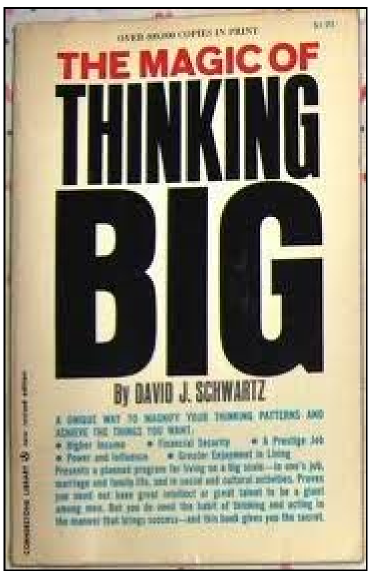
We could probably get down to $20,000 with a little extra efficiency. This seems to be happening already this year, as I have become even more anti-consumer since starting to write the MMM blog. Mrs M and I both feel we spent with abandon in 2010
I know some of you are beating us on a cost-per-person basis. And yet another group of the people currently spending $100,000 per year on a family don't believe numbers like these are possible. If you'd like, share your triumphs and hardships in the comments!

Update: After writing this article, many people asked about health insurance. Right now, Mrs. M. has negotiated some "free" coverage as part of her pay from a part-time employer. Without that coverage, we would get a high-deductible plan for about $240 – $320 per month for the family, as described in a later health insurance article. This is indeed a significant cost at about 15% of our future annual spending – luckily the cashflow from retirement assets is already high enough to cover this expense if we did quit the part-time work eventually.

Weekend Edition: The Magic of Thinking Big

By Mr. Money Mustache

Sun, 29 May 2011 05:44:32 +0000



It’s the weekend, so that means we get to step back for a little bit of Philosophy instead of hard number-crunching. Today, I’ve prepared a little Story for you.

One dark February night in 1992, the skinny teenaged version of Mr. Money Mustache was sitting alone on the La-Z boy chair in his parents’ living room, staring out the window in a severely depressed funk. I had just been dumped by my first girlfriend. Lacking in any past experience, I felt it was the end of the world. There was nothing to do besides shed tears of teenage angst to the soundtrack of tragic Pearl Jam songs.

I needed something to take my mind off of the incredible loss. So I started combing my parents’ bookshelf for something to read. Deep in a remote recess of the shelf, behind the dry Art History books and bizarre Jungian psychology tomes, a much smaller and more approachable book materialized.

The title was, "**The Magic of Thinking BIG**, by David J. Schwartz, Ph.D".

Looking back almost 20 years later, I feel certain that the book must have been 'Stashed there by a future me, just as Biff traveled back in time to give a Sports Almanac to the teenaged version of himself in Back to the Future II, to ensure a drastically more successful life for himself. This tiny and simplistic and charmingly outdated book from the 1950s completely changed my life. And now, Junior Mustaches, I get to share it with you.

You see, with the unexpected growth of this blog's readership, I've started getting quite a few naysayers and anti-mustachian accusations, especially in private messages and other discussion forums.

"You're not really retired!"

"Oh, you must be lying about this or that, because things like that aren't possible in the USA"

"Oh, good luck having your kids go to college because it's almost IMPOSSIBLE to get a degree without incurring a lifetime of debt.. and then the degree will already be obsolete and then it will have been a waste anyway!"

Things don't work like that here in Mr. Money Mustache territory. Here, it's time for the Pessimists to shut up and learn from the Optimists. And for me, my 20 year history of shockingly self-fulfilling optimism goes back to that initial late night spent reading Dr. Schwartz's little book.

The book starts off with an intriguing premise:

"***…The more I observed, the more people I talked with, the deeper I dug, the clearer was the answer. Case history after case history proved that the size of bank accounts, the size of happiness accounts, the size of one's general satisfaction account is the product of the size of one's thinking.***

There is magic in thinking big…. but much of the thinking around us is little, not big. All around you is an environment that is trying to tug you, trying to pull you down Second Class Street.

Meanwhile, First Class Avenue, USA is a short and uncrowded street. There are countless vacancies there waiting for people like you who dare to think big."

–

As you read through, these wickedly memorable phrases continue in abundance. You'll find yourself repeating Dr. Schwartz's classic 1950s one-liners to your unsuccessful friends, only half in jest, as you try to explain your own phenomenal success after the pairing of David J. Schwartz, and his contemporary counterpart Mr. Money Mustache.

In the early chapters, your mind is described as a Thought Factory which employs two Foremen: Mr. Triumph and Mr. Defeat.

If you put Mr. Defeat in charge, he will very patiently have your factory workers present reasons you cannot achieve what you would like to achieve. You're too old, or busy, or too overweight, or not qualified for the job.

If Mr. Triumph takes the floor, he switches the thought production completely. Now, every goal you set starts with the immediate assumption that it IS possible. Mr. Triumph already knows he will win, his job is simply to lay out the steps required to get to that goal, and to keep you excited about cranking through these steps.

Next is the chapter about Excusitis, the Failure Disease. The good Doctor describes a series of real-world people he has interviewed, some who suffer from this disease, who immediately start listing excuses in the face of any challenge.

"I'm fat because I have a slow metabolism."

"I can't ride a bike because I'm too busy."

Then he contrasts these folks to a series of Big Thinkers, who never make excuses and accept challenges with curious enthusiasm. As it turns out, the Big Thinkers are always the successful ones with plenty of money and happy, balanced lives, and the Excusitis Sufferers are always the ones with big and compounding problems.

Amazing, isn't it, that these examples were all of people in the 1950s, and yet the same characteristics also define successful and unsuccessful people today?!

You will find the contrast in your own friends amazing, as you are encouraged to use your real life as a laboratory, doing little thought and observation experiments on yourself and studying the behavior of actual successful and unsuccessful people you know. The observations of the book are all spot-on when applied to real people, even from our current vantage point sixty years in the future.

As the book goes on, it gets into deeply practical strategies to be an actual big thinker yourself. Things like monopolizing the *listening*, rather than the *speaking*, in every conversation. And when meeting with a more senior executive in your own company, realizing that you are not a subordinate and a boss, but two equally important people sitting down together to solve an important problem. Curing Fear with Action. Absolutely golden stuff, every page of it.

When I re-read the book just this weekend, I realized that Mr. Money Mustache has in fact become exactly like David J. Schwartz. We both start each of our golden lessons with an amusing and/or illuminating anecdote. We both write in short and punchy sentences. And we both believe that the modern world is an *absolutely excellent place*, a dense and flowery jungle completely packed with Mangoes of Opportunity that *spray their juices in our faces* every time we take another muscular step through the foliage.

But we're not just living in denial. This confident optimism actually opens up gigantic doors for us and creates unimaginable opportunities.

The reason, of course, is not actual magic, but the effect your optimism has on the people around you. People want to hire you, or to help you, or to work for you, because big thinkers are *very* rare and it's exciting to be around one. The guaranteed key to a happy (and rich) life is to have an easy time working with other people. With this confidence, you don't have to worry about a recession, or a depression, or using gold coins as currency in a post-apocalyptic shanty town, because you'll always be able to work with other people, build a productive community, and have some good fun with your life. As a side effect, you will accumulate much more money.

Here on this particular blog, we're applying Big Thinking to become rich enough to retire drastically sooner than regular people. You will also use your new skills to do better in all other areas of your life, but it's important to occasionally state the real reason we're all here right now.

So if YOU are not already a big thinker, it's time to start training with a visit to your library to find this book. Then maybe I won't get so many doubters in the comments section*!

—

**Actually I'm joking about this last part – we still NEED to hear from people of all perspectives to really understand the current state of our society if we want to have any hope of helping people change. It is ironic that I told pessimists to shut up, right in the same article that I suggest that Big Thinkers focus on listening rather than speaking. But you know what I meant, right?*

Get Rich With: The Universal Men's Grooming Device

By Mr. Money Mustache

Mon, 30 May 2011 14:16:01 +0000

Imagine a device so advanced that it can keep any boy or man, from birth to beyond age 100, looking trim, clean and handsome for life. It can sculpt, trim, shape, or completely remove any hair on your body. It will save you hundreds of dollars and dozens of hours of time EVERY YEAR, forever. Over thirty thousand dollars over a lifetime. But yet this device costs less than $50.00.

"Is such a thing possible?", you may ask.

Well thanks for asking, yes it is!

OK, I will admit I am not the first person to come up with this idea, but I am still its most enthusiastic supporter. You see, I was once your average pay-for-a-haircut type of guy myself. Throughout my childhood, my Mum would take my little brother and I to the barber shop for haircuts every few months. As an older lad, I would walk alone to the manly establishment downtown to get the mop chopped.

I was always quite excited immediately after a haircut because this was when I looked my best. I felt more confident and did more posing in the mirror. But within a few weeks the hair would grow in and I'd lose my edge, and the waiting game would begin – when would the hair be big enough to justify yet another expensive professional haircut?

But then at last, my pain came to an end. A friend informed me of the existence of the Universal Men's Grooming Device. It turned out that they had been selling these buzzing hair trimmer machines in stores for years, and I just didn't know about them. I bought one, and I started cutting my own hair immediately and frequently.

From that point on, I never had to lose my edge! I never had to waste time sitting awkwardly around in the barber shop, watching the old dudes talk about hockey. I had gained control over my own 'Stash of hair.

As I grew older, I realized the UMGD is the ideal machine for Mustache and Beard work as well. A man can easily carve out a nice choppy set of sideburns, or a flowing Circus-Performer Mustache, or a zig-zag Statement Beard in just minutes at any time of day or night. And there's more! If he should decide upon the clean shaven look, the UMGD will instantly lop off all facial hair, leaving only a very fine, uniform and protective Manly Stubble across the target region. So much better than the artificial and painful Girlyman Smoothness produced by razors! And so much more Mustachian, both because of the preservation of a base layer of armor, and the savings of an additional layer of cash from the Gillette Marketing machine.

Again we find ourselves at a crossroads in the article. There are a group of you, probably mostly ERE readers, who already cut your own hair and laugh at my naivete for thinking a tip like this could be useful for anyone.

But I still had to write the article, because I've seen another side of humanity. I have seen *adult men from my own group of friends, not rock stars or presidential candidates, but engineers and everyday office workers, who actually pay to have their short basic haircuts maintained*. And lest you assume they must be trust fund billionaires or dot-com angel investors, *they are not – these are working people with non-infinite money, some even with car loans!!*

I know, I know.. it is hard to believe that precious money could be squandered in such a carefree manner, but I live in a wild area where anything goes, and I haven't even told you the half of it yet.

So, if I did surprise you with this lesson about the amazing Grooming Device, you might want to pick one up instead of your next scheduled haircut. Watch a video on YouTube if you need a quick lesson on technique, or get your wife or roommate to help you.

I have deliberately left out the Lady's Perspective on the matter, because I don't know much about it, but I HAVE heard that it is possible for ladies to cut each others' hair in a non-salon environment, enabling both bonding and enhanced riches. I may even have a few pictures of this happening in my collection.

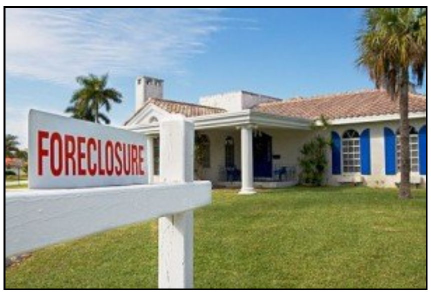
But for now, MEN: You have been saved from a lifetime of haircuts, razors, shaving cream, and time-wasting. The only grooming products you will ever need for the rest of your life are: this one single device, a bottle of shampoo, and a good stick of deodorant. The rest of the multibillion dollar industry can completely fade away now and the airwaves can fall silent because there is nothing left to advertise. And you will be more handsome and manly-looking to go along with it.

Congratulations again. Send us pictures of your fancy new Mustache!

The American Dream is Slipping out of Reach! Waaaah, Waaah!

By Mr. Money Mustache

Tue, 31 May 2011 14:12:36 +0000



A little-known fact about the MMM household is that Mrs. M. actually holds a real estate license. She got this a few years ago as a way to help us both explore our shared interest in houses (buying, selling, renting), and as a way to help a few customers to find homes in our area as well.

But one interesting thing about having this license is that you also get regular propaganda from the trade group called the National Association of Realtors (NAR). Now, I'm all for groups of like-minded people sticking together to support each other. But I am NOT for the extreme case of this, where groups try to change public policy in a way that benefits them, but actually hurts the country as a whole. For example, oil-related companies strategically hiring fake scientists and republican congressmen to inject doubt into the public debate about Global Warming. And pretending that they are actually trying to help us all, rather than just ensure a continued flow of regulation-free oil profits. Industry groups with motivations like that need to fuck off.

What I've found, after reading a few years of the internal messages from the NAR to its members, is that they seem rather slanted towards only increasing the profits of Realtors, and being a bit selective about the evidence they latch onto. They did things like pushing for higher and higher tax credits for first time and repeat homebuyers, and they're always pushing for lower and lower standards for mortgage eligibility, because having everyone buy a house at the highest possible price is in their best interests.

So recently I got to read this funny email from them:

Call for Action: 20% Down Payments Put the American Dream Out of Reach

Could your clients afford a 20% down payment? Could you? Can you envision what your prospective client pool will look like if new regulations governing Qualified Residential Mortgages (QRM) take effect this year?

Neither can we. And neither can many elected officials in Congress who did not intend for these regulatory provisions to be so narrowly defined. We must continue our efforts to explain how detrimental the new QRM rules would be to the ongoing housing and lending crisis in America.

According to NAR Research, 60% of recent home buyers made less than a 20% down payment, and it would take 14 years for a typical person to save up a 20% down payment to buy a median-priced home.

—–

Could my clients afford a 20% downpayment? Well, after a year or so Mustachian Boot Camp they certainly could.

Could I afford one? Umm, Yeah. True, it took me until almost age 25 to get there, but that's because my first house was $235,000 at the time, I bought it as a single person, and I wasted the first few years after graduation driving an unnecessarily expensive car.

"*It would take 14 years for a typical person to save up a 20% downpayment for a median-priced home*". Wow, very interesting. Let's assume these typical people are luxury-oriented and they are ready to jump straight to a single-family home for their first purchase as I did, bypassing any sort of condo or townhouse starter home. The median price of these is $170,000. So the downpayment is $34,000. How much do you have to save over a 14-year period, to end up with $34k? Let's assume only a 4% return on your savings, since you just want a reliable bond fund that won't fluctuate in value when you need it for the downpayment.

The desperately non-Mustachioed savers in the NAR's example were socking away only $150 per month towards their first home!

Now I don't want to be too elitist here, but I do have to insist that someone who can only save $150 per month is NOT READY TO BUY A HOUSE YET! A person with this level of discipline is probably going to buy couches and dishwashers on the installment plan too, and perhaps even, gasp, borrow money for a car.

Imagine what would happen to such a person if he lost his job! He would instantly feel a sharp monetary pinch. If enough people had this situation simultaneously, we'd have to invent some sort of National Insurance system to ensure that they continued to get a stream of money even when they were unemployed. We could call it "Unemployment Insurance". What a funny idea.

And imagine if the precariously financed homes of these ultraborrowers ever fell in value? They would instantly owe more on the house than it was worth. If this happened with simultaneous job loss, some would not even be able to make their mortgage payments, and the banks would have to take back the homes. Others would deliberately walk away from their mortgage obligations, deciding that it's better to break their promise of repayment than to honor it and lose money. It could become a vicious cycle, with falling home values causing even more defaults, and we'd have a national housing price crash.

Yeah, now that we think through that hypothetical situation, maybe we SHOULD ask people to put 20% down. Partly as an incentive to keep their homes through a downturn, and partly just as a test to see if you've read enough Mr. Money Mustache articles to be disciplined enough for home ownership.

The US Federal Minimum Wage is $7.25 per hour right now. $1200 per month if you never do any overtime. Still over $1000 after payroll taxes. Even if you're in the worst case, single and want to own your very own house and split the cost with nobody, you save your downpayment by sharing a house with roommates for $350/month, and buy your groceries, food and clothing for $250. You're saving $400 per month and you'll have your 20% downpayment in less than 7 years.

And it is damned hard to make minimum wage in this country. I pay people $15 per hour to paint walls or dig fence post holes for me occasionally, and I feel guilty for ripping them off with such an embarrassingly low wage. Independent house cleaners charge $25 to $40 per hour.

So, no, I don't think it's unreasonable to suggest that people rake together a 20% downpayment for their first house, just as I don't think it's *reasonable for anyone* to borrow money for a car of any price. If the minimum wage earner can do it, you can do it too with your fancypants high salary. You just have to get a bit more badass about it.

An Experiment with Blog Moneymaking

By Mr. Money Mustache

Wed, 01 Jun 2011 18:06:51 +0000

Looking around at the other personal finance blogs, I notice that virtually all of them have some sort of advertising slipped into the page somewhere. Do these people actually earn money just for wiggling their fingers atop a computer keyboard a little bit each day? Even though it's just a website they created themselves to have some fun writing out their opinions and conversing with other people out in the world? That sounds too good to be true!

So I did a bit of research on the matter. It turns out that earning money for blogging is a very hot, yet very mysterious topic. Some popular writers claim to earn an entire opulent living simply with blog advertising. There is one highly popular blog called Problogger that writes mostly about how to have a highly popular blog. I even read a recent guest-posting on Problogger from a guy who became disabled in a car crash, losing all limb functions, and yet built up an amazingly popular blog of his own, and now earns a great living, including paying for all of his special medical needs and living on the coast of Mexico, doing all of his writing only by speaking into a microphone. Quite entertaining and amazing, all the new things I get to learn as side benefits of becoming Mr. Money Mustache.

But yet there is absolutely no good general information about how much these ads pay on a per-impression or a per-click basis. The few actual people I could find to ask, claim it makes them between fifty cents and five bucks per month. That doesn't sound very worthwhile. So what is the true answer?

As an old computer engineer, however, I must say I am intrigued by the way the system works. Because the blogger just writes articles and has fun with his readers, and meanwhile Google Adsense reads the content of your site and tries to pick ads that are relevant to them.

Advertisers in turn compete for advertising space on this worldwide pool of hosting websites, bidding up the price of keywords and clicks according to what the market will bear. They only pay for actual results – people who come and visit their website – unlike traditional advertising. Google just sits back and maintains the code that automatically hosts this bidding and content-matching. And they collect massive profits from it. Everyone wins due to yet another advancement in technology.

So, unable to find real knowledge about how well it works, I decided to just try it out down in the bottom corner of Mr. Money Mustache*. I fully expect it to not earn any money, but as a person who claims to watch every dollar bill carefully, I have to at least test it out, don't I?

I have already learned that it is quite fun from an administrative perspective. I get to log into my AdSense account and check/uncheck the boxes for the advertising categories that are acceptable to me. Payday loans? Money transfers? BZZZZT. Get rich Quick? Sounds amusing, but BZZZZT. Mortgage rates from actual reputable banks? Cloth diapers? I guess those can stay.

Apparently, just having the ad appear pays very little, but if the ads are interesting enough to have people actually Click on them, the payment is much higher. So it's up to the blogger to filter out annoying or useless results and try to pick categories that people will actually occasionally want to click for their own benefit. For me, I claim to be immune to most online advertising, but I notice as soon as somebody starts talking about Woodworking tools or techniques, I lose my immunity and immediately check out their online store. I'm a sucker for anything in Fine Homebuilding.

One thing I enjoyed during this morning's testing was the fact that Dave Ramsey ads appear on almost every page that mentions his name. I found it ironic that Dave Ramsey might inadvertently be paying me for making fun of him.

So there you have it – my explanation for the ad box that is down in the corner. I promise to keep you updated on any results, and if it does earn any money, I will spend it solely on helping the Earth.. since it would be inappropriate for a man who rails on his countrymen for destroying the Earth with excessive consumption, to profit from that ranting and turn around and use it to buy more unnecessary manufactured luxury products.

If you see any ads that seem annoying or inappropriate, let me know and I may be able to block further categories. Or just ignore them and read on as you were before.

*Actually, Mrs. Money Mustache gets full credit for figuring it out and setting it up… I just get to type stuff while she practices amazing online wizardry to make the technological side all work perfectly.

Insurance: A Tax on People who are Bad at Math?

By Mr. Money Mustache

Thu, 02 Jun 2011 14:20:54 +0000

 I recently read a Facebook conversation about health insurance where one person said, “I’m better off saving the $1000/month premiums and paying for my own medical bills if they ever come up”. And the other person said, “Bah! Recipe for bankruptcy! You need full insurance!”. Which person was right?

Years earlier, I was talking to a friend who had just bought her husband a Rolex watch as an anniversary present. As part of buying the watch, she also bought an insurance policy which would buy them a new Rolex if it was stolen. Was this policy a good idea too?

What about collision insurance on your car? And life insurance?

Insurance of all types – car, house, jewelry, health, life – is a crazy field swayed by lots of marketing, fear, and doubt. In fact, I’d bet most insurance is bought partly on fear and without doing any actual math on whether it’s a good deal. If you’re an average consumer, you spend several thousand dollars per year on insurance. Maybe there’s a way we can cut that down and let you keep some money for yourself!

The first thing to understand about insurance companies is that they are making money off of you – lots of it. They do this by employing a team of brilliant mathematicians called Actuaries who analyze detailed mountains of statistics about the average behavior of people like you, and thus how much money they expect to pay out to you in claims. They then strategically set your premiums to a level where on average, they can pay your claims, pay their employees, and still make a large profit for their shareholders. So they have, of course, rigged the odds against you. So when buying insurance, you will most likely pay in more than you get out of it.

This seems obvious, but some people still need a little reminder, because I keep hearing things like, "I need dental insurance, so I don't have to pay the $300 every time I take my kid to the dentist!". That's a mindset that is imagining that insurance actually SAVES you money on average, which it does not – otherwise the insurance companies would all lose money – which they do not!

Once you understand this, you realize there are only three possible reasons to get insurance in any particular area.

- You're forced to do it (car insurance laws, house insurance required by your mortgage bank)
- You can't afford the consequences (A burned-down house or a year in the intensive care unit at $20,000 per day)
- You are riskier than the insurance company thinks you are (you engage in drunken car racing or competitive eating events on the weekends).Or on a more serious note – if you are **planning or expecting a baby**, or have any known upcoming or chronic health conditions.. these are good times to plan in advance and set yourself up with a much lower-deductible plan. The US is an unusually expensive place to have a baby in a hospital, and even I wouldn't advise risking paying for this out of your own pocket. The cost will range from $3,000 to $1 million+, depending on complications you cannot predict in advance.

That covers the main categories of insurance. But what about things that you can't afford but are really unlikely? Do you get kidnapping insurance on yourself to cover up to a $3 million ransom? Identity theft insurance?

Insurance on your kids? Extended warranties from Best Buy on your new laptop?

Stop! It's all a trick.

Luckily there is a solution: Get almost none of it. Especially if you already have a healthy 'Stash of savings built up and could thus afford any unexpected expenses.

Since you'll be driving only affordable used cars with no bank loans, get only liability insurance. Since you will be keeping yourself healthy for life, get only a "catastrophic" type of health plan where you pay ALL your own bills unless the cost exceeds $5-10k in a given year. Since you will be building up savings and cutting your living expenses, and you are very unlikely to die in the next few years, you may not need any form of life insurance.

My wife and I have never carried life insurance on ourselves, and we consider it a compliment to each other: "I believe you would do Just Fine if I wasn't around, because you're a capable and independent person". Get the highest deductible on your house insurance that the mortgage company will allow. Or if you have no mortgage, the highest you are comfortable forking over after an incredibly unlikely event (I usually set mine at about $10k).

Then for the insurance lines that you are keeping, do a nice afternoon of shopping around – I did this last January and sliced about $300 per year off of my remaining home and car insurance. The winners for me ended up being subsidiaries of Geico, although different people will find their results vary with different insurance companies, strangely enough.

Then put all the savings from these premiums into growing your nest egg, realizing that you are now getting paid to be your own insurance company.

It sounds risky if you let the fear creep in. But it should actually feel deeply satisfying and safe. By not buying into a product where the odds are stacked against you, you are STATISTICALLY likely to win. We can't predict the future, but we do have one tool that lets us turn the unknown to our advantage, and that is statistics. They are my best friend when it comes to becoming wealthy, and they should be yours too.

The savings of thousands per year will add up alongside all your other newfound riches from frugality, and you'll soon find that none of these potential expenses will scare you. Over the past 10 years, I've saved about $40,000 in insurance premiums compared to the average level of spending, and now that $40k is sitting alongside my other employees, producing $2800 of passive income each year, and already more than big enough to cover replacing a crashed car or paying any possible deductibles on medical bills.

And after 10 years of relatively exciting living, I haven't even had to dip into it once. Now I see why insurance companies make so much money!

A Mustachian Microbrewery is Born

By Mr. Money Mustache

Fri, 03 Jun 2011 14:20:45 +0000

 Well what do you know, another Friday has rolled around!

Looking back to last Friday, I see that I wrote about beer and that made us all happy, so perhaps we should talk about Beer on Fridays more often. And lucky for me, I have some pretty exciting beer-related stuff to share today.

After last Friday's article came out, a discussion ensued in the comments section. Several wise MMM readers brought up the idea of brewing one's own beer. I thought this was a fantastic idea. So I teamed up with a few local gentlemen and we discussed our limited knowledge on the subject, over a few beers. Apparently, the beer you make at home can be top-quality as long as you use good quality ingredients and handle the fermentation stage carefully.

One of us had brewed beer before. From his recollection, we needed to obtain these pieces of equipment:

1 5-gallon glass jug called a Carboy, complete with venting rubber stopper cap
1 gigantic stainless steel cooking pot (3-5 gallons capacity)
about 55 clean empty 12-oz bottles, or about 32 20-oz bottles
Fresh caps to seal these bottles, and a cap-installing device
Fresh Ingredients including a barley, hops, malt syrup, and yeast
And, of course, water from a Glacier-fed Rocky Mountain Stream. Luckily, I have this on tap at my house.

With a quick comb of Craigslist, we scored the capping machine and the bottles, along with assorted tubes and accessories, for only $5. A second Craigslist purchase led to the 5-gallon Carboy along with the special venting cap. This was more pricey at $20, but still reasonable. And I already had the giant cooking pot from my Chili-Making habit.

For the ingredients, I discovered that there's a home brewing shop called the Bald Brewer right near my house. So I biked over and obtained a beginner-style ingredient kit for $40. (Upon further research, I discovered similar kits are available online through Amazon.com, but hey, it's good to shop locally sometimes and the Bald Brewer himself gave me some great tips on getting started).

Then it was time to actually brew the beer. This was surprisingly simple. The basic steps were:

– steep the barley in a giant fabric tea bag for an hour, in the giant pot with 3 gallons of water
– increase the heat add the hops and malt syrup at specific time intervals
– cool it all back down and transfer it to your well-sterilized glass carboy for fermentation.. and dump in the included packet of yeast.
– throw on the cap and 'Stash it in your basement for 7-10 days.

That’s as far as we’ve gotten so far. As of immediately before writing this article, the 5-gallon jug in my furnace room looked and smelled very healthy and beer-like. It was bubbling cheerfully as the yeast converted sugar into alcohol and carbon dioxide.

After the 7-10 days, you can transfer it to a second glass jug for “secondary fermentation” (which gives you clearer beer because you leave behind some of the sediment(?)). Then after an additional couple weeks, pour it into sterilized bottles, apply caps, and throw it in your fridge!

To make this process more efficient on a time-per-beer basis, we’re planning to Craigslist a few more glass jugs and another cooking pot. This will allow multiple batches of different types of beer to be brewed in one session. Then you will get hundreds of beers per batch, and you can rotate the brewmaster task among the various members of your beermaking club. With enough surplus beer, you could even begin bartering with neighbors who are better cooks than you are, for nice pre-cooked meals and such.

Initial Investment in equipment: $30
Total Beers Expected: about 50
Total recurring cost per batch: $30 (assuming we buy ingredients in bulk or online next time)
Total marginal cost per beer: $0.60
Estimated time spent for first batch: 3 hours (mostly talking and drinking beer)
Estimated time for an efficient person brewing each additional batch: 1.5 hours

Next update: The transfer to secondary fermentation next week!

Mrs Money Mustache: Eliminating Lady Temptations

By Mr. Money Mustache

Eliminating Lady Temptations
An Indefinite, Ongoing Series by *Mrs. Money Mustache*

Being a Lady myself, I've fallen prey to lady spending in the past and occasionally find myself suddenly "needing" lady things out of the blue. Such as cute shoes, for instance. I have also witnessed many seemingly normal and intelligent women declare that they need to *go in for a manicure ASAP because their nails simply look horrific!* Egads!

It seems that ladies like to spend money on products and services that help them achieve a sense of belonging or importance in society. Things that make them look good and feel good. Things other women have.

I can understand the feeling.. but these usually end up being short-lived "feel good" purchases that are later regretted and could have been replaced by something else that is totally free. Moreover, women often compliment each other on these purchases, therefore reinforcing these beliefs more and more. Why do we do this to ourselves?

Case in point: I have quite a few gray hairs that I have chosen not to color. I have had many, many women tell me that I need to get these taken care of pronto! But yet I have had an equal number of men compliment me on my gray and tell me they think it is beautiful. I think the men may have it right, for once.

And what about the children? Yes, the children! As mothers, what are we teaching our children? In my opinion, we are teaching them something that is potentially very destructive: that we place a lot of value on how we look, that we will pay to look a certain way, and that we reward ourselves with services or products that help us look or feel good. **We are teaching our children to become consumers and that their very happiness depends on it!** The existence of spas for little girls is proof enough that we have a serious epidemic going on here (look it up, they really do exist).

In this series, we will be discussing several tactics for eliminating lady temptations from our lives. These lady temptations include, but are not limited to: spending on shoes, clothing, make-up, books, manicures/pedicures, massages, fancy outings, etc.

Before we start, let's begin by addressing the original source of modern Lady Temptations: The Shopping Mall.

The best and easiest way to start your recovery from the Temptations is to NEVER, EVER go shopping just for fun… EVER. If you are a recreational shopper, please stop immediately. **There is no such thing as "Retail Therapy".** Go for a walk, pick some flowers, hug your family. Get your groceries from a Grocery Store or a Farmer's Market (not Target). If you're going to buy shoes (after establishing a definite need), go in and get the hell out. Be efficient.

And now on to today's lesson: make-up.

Step 1: Eliminate your need for make-up

I'm the first to admit that I don't know as much as some ladies about this substance. I do know that some women love to buy it — often very expensive stuff that promises to reverse aging and turn you into the most beautiful woman in the world. In fact, the plethora of available products for your skin and hair is mind-boggling.

But doesn't make-up usually make you look *older*? And, wouldn't putting a bunch of chemicals on your face actually be *bad* for your skin and potentially age it prematurely? What about wearing a hat when it's sunny? Wouldn't that work better?

I have heard that make-up can help make a person feel good, but it is really just a mask that women wear. Sure, I can understand wanting to hide a giant zit under some skin colored product, but even then, one tiny bottle of a product could last you a year or two, couldn't it? I once purchased a bottle of foundation in high school that lasted until I graduated college. You make-up purists out there will yell at me and tell me that "*foundation doesn't last more than 6 months at room temperature!*" Well, I've just proven you wrong.

What about blush? Doesn't everyone want a nice rosy glow? Well, how about going for a run or doing a few push-ups before going out instead? That'll do the trick every time. Do you want bright glowing eyes? Get some sleep. Red lips? Give them a little nibble and you'll be just fine. Want to radiate from the inside out? Smile!

The funny thing is that most women buy make-up in order to feel and/or look better. Personally, I feel like a fool when I wear make-up. The only thing that makes me feel and look good is being clean and healthy. Nothing makes you feel better than biking around town and getting a natural glow, washing your face, exercising, smiling, drinking lots of water, eating organic apples. Try it.

Take inventory of your make-up right now. You may have a lot more than you thought. Tomorrow when you wake up, try not wearing any at all. Go out for a brisk morning walk after a full 7-8 hours of beauty sleep. Take a shower. Drop and give me 20. Smile. Then, take a deep breath and just go. Leave your mask behind. Write in and tell me how you did.

Dude, where's my 7% Investment Return?

By Mr. Money Mustache

Mon, 06 Jun 2011 14:27:02 +0000

In most of my examples of small savings adding up over time, I assume that you the saver are not only saving the money, but investing it for some compounding gains.

For example, I once stated that saving $25 per week by skipping a restaurant meal adds up to about $19200 after 10 years. To get numbers like that, I'm assuming that someone is investing the $25 each week into an imaginary investment that goes up in value a little bit each month, for a total gain of 7% per year. Without this compounding, the $25 per week would still add up to a big number.. but it would be $13,000 instead of $19,200.

Is this realistic? Many people have questioned my optimism. And others have questioned my pessimism: Dave Ramsey often repeats the phrase that "the stock market average return has been 12% for the past 70 years" – so why am I using 7%?

To the credit of the pessimists, it is true that a person investing a monthly series of payments into US stocks over the ten years leading up to **right now,** June 6th, 2011 would have only yielded 2.3% per year compounded. After adjusting for inflation, it's even worse: the investment is worth less than 1% more than it was ten years ago.

Why did this happen? To find out, let's look at a chart of the S&P 500 index over the super-volatile last ten years:

As you can see, the stock index is now very close to where it was ten years ago. The only thing that provided even the tiny 2.3% annual return I mentioned was the quarterly dividends you would have received (adding just under 2% per year), and a small benefit from dollar-cost averaging (by buying, say, $1000 per month of shares, you would automatically end up buying more during the months stocks were in the bargain bin, like in 2002 and 2008).

So with the stock market being so volatile, how can we be expected to use it as a short-time retirement planner?

Unfortunately, I cannot offer any guarantees. But I can offer an interesting example of how statistically unlikely this is to happen in any given 10-year period, loosely paraphrased from a stock market book I happen to be reading right now.

Imagine you could fly freely back and forth to any year between 1950 and today. And you could test out the stock market returns for all possible periods in that range. For example: measure the return for a one-year period beginning in January 1950, ending in January 1951. Then measure from February 1950 to February 1951. And so on, through all the many hundreds of possible hypothetical 1-year investments.

Then repeat this whole test for all possible 5-year holding periods. And 10-year periods. And 15, 20, and 25-year periods.

If you use a time machine, or even just a regular computer to do all of these tests, you get some pretty neat results. Check out how quickly the stock market volatility smooths out over time:

- **1-year holding periods: Worst: -37% (and it was in 2008!) Best: +52.62%**
- **5-year periods: Worst: -2.35% Best: +28.55%**
- **10-year periods: Worst: -1.38% Best: +19.35%**
- **15-year periods: Worst: +4.31% Best: +18.93%**
- **20-year periods: Worst: +6.53% Best: 17.87%**
- **25-year periods: Worst: +7.94% Best: +17.24%**

The average for all periods is of course the average annualized stock market return for the overall period, which is about 11.1%

After adjusting for inflation, this 11.1% annualized number would become 7.16% over the 1950-2011 period. (Inflation was very high during the 1980s, so it averages to 4% in this example instead of the 2-3% currently forecast for our own future).

So what do you do if you happen to hit the wrong 10-year period and your savings don't grow as expected? Having done much of my own retirement saving during the past decade, I'm in this boat myself.

*[**An Update from nine years after this article was written:** sure enough, the stock market has worked its usual magic. The slow growth of 2001 – 2011 was more than canceled out by an unusually powerful bull run in the stock market from 2011 to 2020. Anyone who accumulated shares in that earlier time is now looking pretty clever, and wealthy. But now, back to 2011:]*

The solution I like to use is to just remain flexible. I did end up working longer than originally planned because of the stock market fluctuations, and during lean years of the stock market, I decided to spend less rather than withdrawing savings right after the stock market crash of 2008.

I also like the idea of keeping a local rental house as part of my portfolio, and always leaving the door open for any amount of part-time work that might be needed.

There are also less risky investments that you can make – mixing stocks with bonds or other more stable (but on average lower return) investments is very standard advice for people as they get closer to retirement age. Those mixtures deserve their own articles for the unique situation of a Mustachian Investor, since some of us might be just making their first investment deposit as a new graduate, and yet still be less than 10 years from retirement!

But meanwhile, at least we can say this: If you plan for a retirement income that is pretty cushy, say $40,000 per year for a small-to-medium family, you have plenty of fat that can be trimmed in the event of down markets.

On average, if the stock market continues its historical performance, your investments will return close to 7% per year even after keeping up with inflation. But to get the full benefit of this 7%, you would need to time your spending strategically: reduce spending if you hit some bad stock market years early on in your retirement. Then you can crank it back up during future booms.

If this sounds too complicated, you can of course just work for an extra year and build the portfolio even more. But being a man who thinks flexibility and early retirement are all part of the same package, I prefer to take on a little more risk in exchange for more free time earlier in life. Even during one of the worst 10-year periods in stock market history, I have to report: so far, so good.

There is obviously much more to say on the topic of stock investing. I've been reading more books than usual on the topic recently, in an attempt to answer various unexpected questions that people have been sending in to the new MMM home office here. It has been quite valuable to me to hear so about the situations of many other people. The questions have forced me to learn more for my own benefit as well. And all of it has inspired a whole series of stock market articles, so let the Investing Series begin!

Where should I Invest my Short-Term 'Stash?

By Mr. Money Mustache

Tue, 07 Jun 2011 14:20:49 +0000

Welcome to the third post in the Investment Series. For those just joining us:
Article 1 told you why investing in stocks is actually pretty simple, and
Article 2 described the volatile nature of stock returns.

So we've established that while long-term stock market returns have been quite predictable for over 100 years, with an after-inflation return of over 7% per year, we've also noticed that they fly up and down in an absolutely random manner in the short term. And "the short term" can actually mean periods of up to 15 years.

So: for long-term savings, like the money you are saving in 401(K)s, Roth IRAs, Canadian RRSPs and such, stocks are still the best balance of large long-term gains versus risk. You'll see some alarming swings if you check the stock prices every day, but if you just open up your statement on the day you turn 59.5 to start your withdrawals, you will probably be pleasantly surprised.

What about money you need for more immediate needs? Say you are saving for a house downpayment that will take two years to accrue. Or you received a gift from your grandma to pay for your college education, but you won't even be graduating from high school for three years. Here is a list of investment types and their current approximate return rate, listed in order from safest to most volatile (and most rewarding over time):

No Volatility:

- *Bank Accounts:* the best I know of is ING Direct Orange Savings account – still only 1.0% right now. Checking accounts don't deserve ANY of your money – enough to handle the monthly automatic-bill-pays only.
- *Money Market Funds* (such as Vanguard's Prime Money Market Fund) have historically delivered higher returns than savings accounts but not with today's lowest-in-history interest rates. Less than 1.0%, so skip 'em for now.
- *Certificates of Deposit* – where your money is locked up for a specified time period in exchange for more return. I just copied the following rates for today from bankrate.com/cd.aspx

1-year CD	1.31% APY ($1000 min. balance)
3-year CD	2.00% APY ($500 min. balance)
5-year CD	2.75% APY ($500 min. balance)

- And, of course, the best guaranteed no-volatility place to invest your money may be ***paying off existing debt***. Your mortgage, your student loan, or if you still have superbad loans like car or credit card debt, you need to get on those, emergency style, before you consider saving for anything else.

As I suggested in an earlier article called "springy debt instead of a cash cushion", until you are completely debt-free it may make sense to use a line of credit as your cash cushion *instead of* short-term savings. Because which one makes more sense: saving for an upcoming purchase in a 1.0% bank account while simultaneously paying 4.5% on your mortgage, or putting all the short-term money into the mortgage and just borrowing back whatever you need at 3.25% in the form of a line of credit? Another reason I like this approach is that it reminds you that until you are mortgage-free, you are effectively borrowing for *everything* you buy. Not necessarily bad, but it is good to be reminded of this when you're at the pub deciding whether or not to spring for another pitcher.

Medium Volatility/Medium Returns

- **High-quality corporate Bonds**: These have recently delivered a 4-5% return and yet are much less jumpy than stocks. Take a look at the ten-year performance of a suitable Vanguard Bond fund (VFSTX) compared to my favorite big US index fund (VFINX):

After looking at that 10-year comparison, you might wonder "why would anyone buy stocks when the bonds do so well?". The answer lies in the longer term. Since its inception in 1976, the stock fund has compounded at 10.72%, while the bond fund (started in 1982) weighed in at only 6.99%. Over a 30-year period, a single $100,000 invested in stocks would have become $2.1 million, meanwhile a bond investor would only have $759,000. Still, for 1-3 year savings with a still-reasonable return, I'd feel fairly happy with the bond fund myself.

- **Mixed Stock/Bond Funds:** Vanguard's VBINX is a mixture of 60% large company stocks and 40% investment-grade bonds. In bad markets, it is safer than VFINX. In good markets, it underperforms the pure stocks.

For someone like me who wants a growing-but-semi-stable pool of money to use up over the next 5-10 years, a mixed fund can be a good choice. I can leave my long-term “old-man” money in stocks, but keep 5 years of living expenses in a mixed fund like this, and automatically make monthly transfers to the checking account to fund regular living. In the event of a stock market crash in the long-term investments, the VBINX takes a much smaller hit and thus principal is preserved. Then I could wait at least 5 years for a recovery in the main market before topping up this fund again.

Hint: If you want to do a little fund shopping of your own, you can play with the same web site I used to generate the graph above. Start here and then start clicking around on fund types, or type a fund symbol into the box. Then you’ll see a “growth of $10,000” tab which will get you into the nice charts.

In all cases, do your own math on short-term savings and figure out how much you expect to earn from the investment. If you’re just saving to buy a tricycle for your daughter next month, or a $5000 used car in three months, there is not much benefit in worrying about investment returns.

Also remember that the more you cut your spending in general, the faster your savings accrue, meaning you don’t have to think about saving as much. Some dual-income families need to plan months ahead even for a new washing machine, while their Mustachian counterparts could buy an entire car with less than a month’s notice, and the only effect would be that they would pour less into their long-term investment accounts that month. This flexibility and convenience makes your life much simpler and happier – yet another reason frugality rules.

The Joy of Self Employment

By Mr. Money Mustache

Wed, 08 Jun 2011 14:20:20 +0000

When I retired from real work back in 2005, I inadvertently crossed a very interesting divide in our society. It was the canyon that separates the People with Real Jobs from the Self-Employed.

As it turns out, I was entering a sparsely-populated area. Only about 1 in 9 workers in the US is self-employed, a figure that is lower than Canada and most European countries. Those numbers surprise me since we’re supposedly an entrepreneurial country with over 60 percent of all new jobs coming from small companies with under 500 employees.

But yet now that I AM self-employed, I seem to hang around with and meet almost 50% self-employed people. Maybe it's my neighborhood, which is a bit of an earthy and less rat-race oriented clump of historical housing. Or maybe it's just the tendency of entrepreneurial people to select a like-minded group of friends.

But by joining this minority, I've gained a very interesting new perspective on what it means to have a job and to earn money in exchange for "work".

When I had a job, I always thought it was a pretty special thing.

"Ooo, I wouldn't want to lose my Job. What if I could never get another one?"

"These job thingies sure are mysterious.. I show up for work each day and type on a computer, and they magically deliver great gobs of money to my checking account. How do they do it?"

"I wonder how jobs even get created? I don't really know, since all I've ever done is take jobs rather than make them."

As a member of the plain old Employee class, I was always curious about the mysterious world of the Self Employed Business Owners.

"Imagine, being your own boss!", I would think. *"Why, you could set your own working hours, or even your own working Seasons!" "Man, the first thing I would do is strike Mondays entirely from the work schedule."*

So I started checking out library books about starting one's own business. They dealt with the tax laws, the trade-offs between Corporations and simpler partnerships like the LLC. It sounded fairly complicated at the time but I soaked it all up and when it came right down to it, starting a business really only required these two steps:

- Go to the IRS website and apply for an employer identification number (EIN)
- Go to your state's website and register your business with the state. This may involve submitting a signed document or two and a small fee (it was $50 here in Colorado).

  Hints: To find your state website, just do a Google search for <your state> register a business. Also, for your first business you probably just want to use the LLC organization style .. it is flexible, simple, and you can change it in the unlikely event that you ever need to.

Boom, you have a business! You can use the new EIN to get a bank account in the name of your business, to file business tax returns at the end of each year, and things can grow as much as you like from that point.

So I followed the steps and started my own business, just before retiring from real work. Initially my new company seemed just an imaginary concept. But then a sense of reassuring power started to seep in.

People started asking me for help with things, and then asking "How much do I owe you?"

At that point, I would create a quick spreadsheet telling the person how much money I wanted them to give me, *and they would give me exactly that amount!*

It seemed amazing to me that I could hang around in someone's house to set up a computer network, or play with advanced power tools in the garage to build eco-friendly coffins for a local company, or even answer questions about the power consumption of an electric vehicle, and receive real money for these services – valid money which I could then trade for groceries.

At this point, I realized I would never go hungry. If I really want the amazing firehose of cash that full-time professional employment provides, I can go get one of those jobs. If I just want occasional boosts of cash and/or self-esteem, I can crank up or down the self-employment schedule as needed. Since I don't have much need for regular income, the self-employment gig is really just a reassuring companion. Self-employment is a big muscular friend who follows you around and smiles a lot, but cracks his knuckles and lets out a very loud 30Hz growl if Life ever attempts to get up in your face.

My amazement at getting paid for doing random fun projects around the town continues to this day. But yet I do not have any of the burdens of a real job. When I wake up every morning, my only obligation is to the coffee machine and the frying pan, to make the family a nice breakfast while they play in the living room or the garden. When it rains or snows, I laugh heartily and grab a good book or a vacuum cleaner and watch the storm through the comfort of double-pane windows. When the sun shines upon the Rocky Mountains the other 300 days of the year, I take great pleasure in mixing bicycle errands and completely random local work into my mostly full-time parenting schedule.

Meanwhile, almost everything in life has become tax-deductible. The main things I spend money on besides groceries are: tools, a good computer or camera occasionally, and cell phone and internet service. All of these are required by the business, so the business pays for them. With this newfound additional blog writing hat in the closet, I might even be able to write off some travel expenses in the future.

And all the while, there is nobody sitting in their corner office clucking their tongue and checking their watch and wondering when that Money Mustache lad is ever going to get to the office.

If you already have worked for yourself, you know what I'm talking about. But if you've only ever been an employee, you might have an unnecessarily fearful view of your financial future. An employee does not have complete control of their income stream, and for most of us, lack of control causes fear.

Mr. Money Mustache's neverending prescription for curing fear is gaining more control over all aspects of your life. Spending less money instantly increases your control. Building up investments that provide passive income gives you even more control. And starting your own business, even if it's just for some learning and dabbling on the side while you keep your day job, brings you even more of that happy, coffee machine and frying pan, laughing on the back patio with a giant homebrew, Control.

How to tell when the Stock Market is on Sale

By Mr. Money Mustache

Thu, 09 Jun 2011 14:33:36 +0000

In a recent article in this Investing series, I mentioned that the S&P500 index had delivered an annualized return rate of a little over 11% (7% after inflation) for the past sixty years.

But what caused that generous rate of return? And is there any way to know if the market is likely to return a similar, or drastically higher or lower rate during our own investing lifetimes?

To make a surprisingly educated guess, you just need to understand the formula that determines each individual company's share price:

Share Price = Company Earnings per share x Price-to-earnings-ratio

The Price-to-earnings ratio (P/E for short) is further determined by these factors:
Earnings growth in recent history x Bullshit Random Estimates of Further Growth

Thus, companies that have recently been enjoying growing profits, and are flashy and exciting and thus expected to see continued profit growth, are rewarded with higher P/E ratios and thus higher stock prices.

A good example of a currently stylish company is Google, which trades at a P/E of 20 (Google's shares are worth $500 each, because their earnings per share are $25, multiplied by the P/E of 20)

A less flashy but still very profitable counterexample would be the oil company Chevron. Its share price is only about $100 – earnings per share are $10.30 and the P/E ratio is a nice conservative 9.71. If the P/E ratio were the same as Google, Chevron stock would be worth over $200! This is because investors expect Google to grow much faster than Chevron over the coming years.

But since nobody can really predict future earnings of a company more than a few months in advance, the Bullshit Random Estimates factor is subject to revision each and every day, which is why the stock market fluctuates so wildly.

Luckily, when you're looking at the whole collection of 500 large companies, over a period of many decades, you can see a much more sensible pattern. An average P/E ratio makes itself visible, which turns out to be the number 16.4. They get this number by calculating a weighted average of the P/E ratios of ALL the 500 companies in the S&P500 index.

So, you could say that when the stock market P/E ratio is above 16.4, it's unusually expensive. When it is below this number, it is ON SALE! You can of course dig deeper into the details and find exceptions to this rule, but a detailed statistical analysis of the market history shows that if you can buy the stocks when they are on sale way below 16.4, your next 10-20 years of investment returns are unusually good. If you buy when it is way higher than 16.4, you are likely to get lower-than-average returns.

This is because in the long run, company earnings and dividends tend to grow at a fixed rate – the same rate as the entire US economy, which has been about 3.3% after inflation for most of modern history. If you buy a stock which pays a 2% dividend, and its earnings grow at 3.5% per year, and the P/E ratio stays the same over time, it turns out you will get a 5.5% return after inflation (8.5% or so before inflation) on that stock. But if the stock market temporarily goes in or out of fashion and the P/E ratio rises or falls, your return can much be higher or lower. From the 1950s to the year 2000, the P/E ratio went up quite a bit, which provided great returns for investors over that period.

In the Dot-Com peak of March 2000, the S&P index was teetering at a dramatically high P/E ratio of over 30. In March 2010 ten years later, the companies were actually earning MORE money, but the stock index was worth about 30% less. That is because people were less euphoric over stocks at the time, so the P/E ratio was much more realistic in 2010.

In March 2009, there was a massive stock market crash and the stock prices fell so low that the P/E ratio was only in the 13 range. A level of bargainville that hadn't been seen since about 1986. If you bought stocks back then, you are already up about 100% in two years because both earnings and the ratio (investor enthusiasm) have grown.

So what is the current P/E ratio of the index? It is the current price (1280) divided by last year's total earnings per share for the companies ($78.86). Giving a ratio of 16.23 – right around the average.

So the stock market is right where it should be, historically speaking, and if this ratio persists, you will get a return equal to US GDP growth plus the current dividend yield that the stocks are paying right now: 1.83%. That adds to 6.83% before inflation. If, on the other hand, P/E ratios go higher due to enthusiastic investors pouring back in as they did in the 1980s and 1990s, you may get lucky – if you are doubly lucky enough to know when to cash out some of your gains into more stable investments before everything reverts back to the mean.

I still don't recommend trying to outsmart the stock market by timing a repeated series of buys and sells. But I still like following this evaluation method to determine if I'm crazy to add more to the stock portfolio at any given point in time. When the market strays quite far from the mean P/E ratio, that's something to get excited about.

Weekend Edition: Health = Wealth

By Mr. Money Mustache

Sat, 11 Jun 2011 14:11:52 +0000

This week I accidentally got sucked into looking through one of those mindless ad-laden Forbes features on the world's top billionaires. The leader of this flock, the current richest person in the world is a dude in Mexico called Carlos Slim, with a fortune of about 74 billion dollars. And as it turns out, "Slim" is a bit of an optimistic last name.

Then I clicked down the list to look at the other people. And I started to notice a pattern. Despite their unimaginable heaps of wealth, as a group they look far from exceptional in the area of health.

If you ask the typical person, even here in the United States: What would you rather have:

1. A gigantic amount of money, but be overweight and/or frail to the point of needing an elevator to get up to the sixth floor of a building, or
2. Just a comfortable amount of money and a gold-quality, healthy energetic mind and body that keeps you jumping around having fun with no health issues until you're 100 years old…

What do you think he or she would say?

I haven't formally surveyed any groups myself , but I have a feeling most people would pick the exceptional health option.

The good news is, it is much easier for most of us to get exceptional health than billionaire wealth. All you need to do is keep your body doing something other than sitting in a chair for a few hours each day, lift some weights occasionally, and eat the most natural and unprocessed foods you can find.

But yet the surprising truth is that most people are actually spending most of their time (40+ hours per week) pursuing the Wealth rather than the Health. Then the Wealth is often invested in unhealthy activities like sedentary sightseeing vacations, eating two-thousand-calorie restaurant meals, and gas-powered recreational pastimes like motorboating and ATV riding.

I won't get into the issue of the nation's increasing waistline because I don't know enough about all the complicated social and industrial factors causing it to comment.

But I do know one thing: YOU have a chance to be super-healthy, and if you are not already a permanently grinning, well-muscled ball of energy like this elderly Japanese man, then I suggest you should consider becoming one. The reason is because it will make you happier, just like becoming rich and achieving an early retirement through frugality will make you happier.

It's time to raise our standards for ourselves. I don't look like Vin Diesel right now, but dammit, I am going to! I'm no longer going to settle for being moderately fit. I want to be at Maximum Health!

Are you ready for my Inspirational Bombshell? Then have a look at this **74-year-old** woman named Ernestine Shepherd, currently the world's oldest female bodybuilder.

 Eh? What do you think of that!?

I was already an optimist when it comes to old age, because I am often passed by gray-haired old men when I'm trying my best to speed along on a country road at 40 km/hr on my road bike. But this lady raises my standards WAAAY higher than they've ever been. Just seeing the picture made me realize that I totally suck so far, and I must do much better from now on.

If you're already at Maximum Health, then good for you. If you're not – what is holding you back? For me, it has been a case of Excusitis. I've been telling myself that because I'm already better off than most people, that is good enough. But that's a tricky game to play. *If you're not taking the best possible care of your health – who do you think you are fooling?* I'm getting older. It is absolutely unacceptable for me to become one of those self-disabled people – i.e., a person who loses their health and mobility through decades of sedentary lifestyle. If I ever have a serious health problem in later years, and I haven't maintained Maximum Health, it will be my own fault. So from this day on, it's Maximum for me. And you too!

There are lots of good books in the library about how to get healthy, but if you just want the Mustachian summary of the most important secret steps, here it is:

Never eat any form of white bread, soda, candy, cake, cookies, fast food, donuts, or other fakiepants food at home or at restaurants. (You can still have it at parties).
I'm always amazed to see people eating these things, because once again, who do they think they are fooling? IT'S NOT FOOD!! Your body hates that stuff! You can still get the indulgence of yummy but awful food

occasionally when you are at a friend's house. But to actually buy it as part of your grocery trip? That's just self-destructive, dude. Just this one step would cure 50% of the nation's health problems

Eat lots of healthy proteins and fats.
Your new snack around the house is almonds and walnuts. Bananas with all-natural peanut butter. Apples, mangos, cheese, eggs, beans of all sorts, delicious slabs of fish, chicken, rice, all the olive oil you want, lots of spices, whey protein powder mixed with milk, burritos, cilantro, salads with rich natural oily dressing.. stuff like that. You're not on a low fat diet – you're just on a low-processing diet. Your appetite will adjust to start taking in the right number of calories (instead of too many) as soon as you drop refined flour and sugar from the diet.

Obey The Mustachian Commandments on Alcohol Consumption
Alcohol is fun! I drink it regularly. But I know it is toxic. You're drinking from a bottle with a skull and crossbones on it, so respect the poison and realize it is draining a tiny bit of your health directly with every sip.

Always accept Exercise when it stares you in the face!
For example, there are only two valid reasons for a person with functioning legs to EVER use an elevator or escalator:

1. You are moving a trolley of heavy equipment or construction materials between levels of the building
2. You are an olympic athlete who has just finished training SO HARD that it would be detrimental to your competitive performance to climb even one more flight of stairs

For the rest of us, stairs are a gift from the Fitness Gods, so thou shalt run up them whenever thou findest them. Even if your office or hotel room is on the 15th floor (I did a test on a recent vacation – 15 floors takes only about 90 seconds at a moderate stair-climbing pace in even in my current Non-Vin-Diesel condition). Even if you're carrying a suitcase at the airport – come on, don't be a big sissy.

NEVER use a car when a bike or your feet will suffice.
Every trip under 5 miles on a day with reasonable weather must be done by

foot or bike. Yes, even to the grocery store or taking your small child to school – use a bike trailer. In addition, if you work less than 10 miles from home, you must bike to work at least twice a week, whenever it is above freezing and not raining or snowing.

Following these steps will get you to Good Health. To get to Maximum health, you need to add weights – three times a week, for as little as 18 minutes per session (3-4 sets of 3 varied heavy exercises with no rest between them). If you like running or swimming or other sports, add in some of that too, good for you!

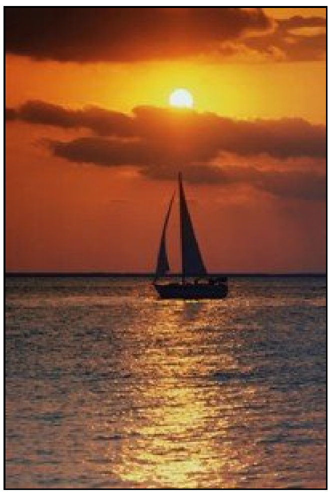
Now that you see it all in one blog posting like that, it's a pretty easy way to add 60 years of healthy energetic Good Times to your life, and millions of dollars in income and saved expenditures, don't you think?

How will YOU achieve Maximum Health from this point onwards?

Case Study: Growing a Money Mustache at Sea

By Mr. Money Mustache

Mon, 13 Jun 2011 14:06:52 +0000



I just got an interesting request for a Mustachian Makeover*. Here is our reader's story:

Dear MMM,

I was wondering if you might want to do an analysis of some reformed spenders working hard on their stash but dealing with the repercussions of previous and lasting life choices (like a mortgage) in their newly reformed lives.

My husband and I have a large mortgage at 6.5%. It is also (cringe) interest only. We were paying a little extra on it every month, but I have since stopped and opted to invest that extra instead. My thinking was I could keep up with or beat 6.5%, and if anything terrible were to happen I didn't want all our extra money tied up in a house that was still underwater. We save as much as we possibly can every month, including contributing to a 401K,

$500 to each Roth every month, and additional savings. We live on a very strict budget in order to max out that additional savings.

We recently made a huge life change. We have a boat which we intended to live on after selling our house and while building a new one. Selling our house didn't happen though, so instead we have rented out our house and moved onto the boat. We continue to save what we did before, but now additionally save the rent payment and the money that was being spent on utilities, cable and internet. It's amazing how much extra money you save when moving to a smaller space!

Our house is under water. If we were able to pay the mortgage down by $100,000 we would be able to refinance at today's lower rates and the rent would cover our new payment and then some. Instead, we're stuck in an interest only mortgage with a balance that doesn't move and rent payments that cover only about 70%.

Eventually we would like to move back onto land, probably in a different area. Our only other debt is our car payments – modest in comparison to old payments, but (I know) still not very mustachian. The rates are only 3.9% though.

What would you suggest is our best course of action? Should we put everything towards the mortgage instead of investing it? Or should we try to make our savings grow at a faster rate than the mortgage, and then later use it to pay the mortgage down and refinance? If we can eventually bring the mortgage payment inline with the rent, should we look into buying a smaller more practical home while continuing to rent the existing one, or should we move back into the one we already own?

———

Dear Lost at Sea,

First of all, congratulations on your new-found Badassity! Moving from what sounds like an expensive luxury house to a boat is a sign that you have what it takes to get yourself out of trouble very quickly, and then amass some serious riches for yourself in your new future.

From the sounds of it, your mortgage situation will never go away unless the house appreciates quickly, or you get it paid down to a level where refinancing is possible. The bad news is, housing appreciation is unpredictable and a $400,000 house would take 11 years at a 2% inflation rate to appreciate by $100,000. The good news is, a hundred grand is pretty easy to come by when you have two people working.

You didn't tell me the price of your house, or the mortgage balance, but let's assume it is a $400,000 house with a $400,000 mortgage. To refinance, you need to pay off at least $100,000 so that you have 20% equity to qualify for a good mortgage.

Current interest cost: 400,000@6.5%: $26,000 per year
Interest cost after paying down $100k and refinancing: $300,000 @ 4.5%: $13,500 per year
Savings: $12,500 per year.

So by investing $100,000 into your mortgage, you'll end up saving $12,500 per year in interest. That's equal to a guaranteed rate of 12.5%** on your payments – the best you will get anywhere in the world.

So I would suggest that you temporarily suspend ALL savings for this emergency – 401k, Roth, investments, piggybank, whatever, and put it straight into the mortgage. Transfer any liquid savings over as well, except for a small 'Stash in case of emergency expenses. Every cent you put in is earning you 12.5%, so it is very exciting! Skip dinners out, skip driving on weekends, and just go crazy on that hundred grand. Plan all your rewards and future purchases for sometime after you reach that goal of getting this refinancing done. Also, we cannot predict when interest rates will rise, so the sooner you get it done, the better.

Next, if you have car loans, you probably have cars that are way too expensive for your current net worth. You could save an additional boatload of money by selling them both, and buying some nice 2004 models for $5000-$8000 each. Toyota Corolla, Matrix, Scion xA, Nissan Versa, Honda Civic, even a Volkswagen Jetta or Golf TDI – all great choices because of fuel savings and tying up only a small amount of cash.

Mr. Money Mustache feels that nobody with less than a million dollar net worth should even consider buying a new car (and even then, you must pay cash of course), and even then it must not be a car over $20,000, and even then they must punch themselves in the face after making the purchase to acknowledge the unnecessary expenditure.

To answer your other question about the long-run housing choice – to answer that seriously I'd have to know about the size of the house, the cost, the location, etc. But to put it in my usual generalized and opinionated terms, I would say a couple with no kids should have a house no bigger than 2500 square feet (ideal size is 1500 sf), that costs no more than three years of their combined salaries put together (ideal ratio varies widely depending on your city). Instead of size, focus on quality, like big windows with nice views, open floorplan, big fancy kitchen with a nice island for entertaining people and cooking at home, in a walkable and bikeable neighborhood that will free you from car dependence. And of course, with a minimal or zero commute to work. So you may indeed want to downsize and pick a new location.

As for renting it out vs. selling it at a loss – it is a good rental if the annual rent income exceeds about 6% of the current market value if you sold it. Or AT LEAST if the rent payments cover all the costs and you don't mind being a landlord.

Once you get to this stage (or even sooner if you like), write in and tell us how you're doing and we can tell you how to get the additional million dollars saved for a luxurious semiretirement for both of you.

I'll admit this is a wide-ranging and highly detailed prescription. But hey, you asked for a Mustachian Makeover! If you follow it to its fullest, I guarantee you will both be retired, muscular millionaires with great happiness and health within 10-15 years, and Mother Earth will open her big blue watery eyes and wink at you as you sail your boat over top of them on a sunny summer Sunday shortly afterwards.

* The reader actually invented the term Mustachian Makeover herself, and said I could add it to the growing MMM dialect. Thanks, Lost at Sea!

** Note that even though we don't know her mortgage amount, the actual return on the 100k invested is likely to be equal to, or even greater than the 12.5% listed, since the savings amount scales up with the ratio of current mortgage size compared to $100k.

Equally Shared Parenting

By Mr. Money Mustache

Wed, 15 Jun 2011 14:06:27 +0000

 Did you know that the MMM family was actually somewhat famous, in an anonymous and obscure way, before Mr. Money Mustache even started typing this blog?

It all started back in 2008, when Mrs. M. was surfing around on her computer and came across this website about Equally Shared Parenting (ESP for short). If you've never heard of the concept, it's an old-yet-new idea where two parents raise their children together, spending an equal amount of time with them and splitting as many roles as possible evenly between both parents.

To sum it up, ESP is the opposite of the old 1950s "Executive Father" situation, where the Mum stays home with the children and does ALL of the work. She feeds and changes the babies, gets them to and from school, is the shoulder to cry on when they need help, and does all the housework and cooking. The father just comes home from work each night and says, "How are my little munchkins today!?", gives them a goodnight kiss, and relaxes with his pipe and a Scotch and a newspaper or television for most of his evenings and weekends.

From a Manly perspective, I must admit this sounds pretty nice on the surface. The only problem is he's not really raising his kids. The Dad in this example is just a household appliance, who brings home a paycheck and does some superficial bonding with them. The Mom is the parent, and the one who has the real emotional connection with her children.

For some couples, this still seems fine. There might be one person who has a naturally career-oriented mind and one who has an unstoppable nurturing instinct. And because of genetic or cultural conditioning, take your pick, these roles sometimes end up being played by the Dude and the Chick, respectively.

But for people with more curious minds and a taste for experiencing more out of life, Equally Shared Parenting is the exciting alternative. Now you are both Moms. And Dads. And as it turns out, that's the way Mr. and Mrs. M had always assumed we would raise our kid(s), even before discovering this popular ESP website. Our own biggest reason for saving for an early retirement was that we knew we wanted to both be not just equally sharing parents, but equally sharing stay-at home parents. Even with no first-hand knowledge of child-raising, we knew it would be tough, and worth giving our best combined effort. And we looked forward to the privileged sneaky feeling of doing stuff together as a family for years to come while the rest of the world was at work. This triggered "The Talk", as described in an earlier article.

So when Mrs. M. found the Equally Shared Parenting website a few years into our experiment, she was quite excited. An online conversation between Colorado and Massachusetts (where the authors live) ensued:

Mrs M: "Hey! I love your blog! We're doing equally shared parenting too, and we love it!"
ESP: "Oh Hi! Glad to hear it. Would you like to share your own story with us?"
Mrs M: "Sure, (….typity typity type…) here it is."
ESP: "Wow, this is a really interesting one. Can we interview you for the book we're writing right now?"

So the guy from this couple, named Marc, happened to be in the Boulder area a short time later, and he made a stop at our house. Having heard about our frugal early retirement in advance, he expected to be visiting some sort of shack on the edge of town and talking to a couple of people clad in clothing of cut-out potato sacks. But instead he found good ol' Mr. and Mrs. Money Mustache, living a perfectly normal life, even a bit excessively nice compared to normal, made possible mainly by cutting waste. We talked about the joys of the combination of the ESP and MMM approaches late into the night, set him up in a guest room, and eventually appeared as example characters in the book called Equally Shared Parenting: Rewriting the Rules for a New Generation of Parents.

This isn't a parenting blog specifically, but I still thought it would be fun to share this little side story with you. Because becoming parents was the first catalyst for us realizing we wanted to be freed from mandatory work early on in our lives. Looking back, it was **definitely** the right choice, because the years of army-interrogation-level sleep deprivation that came with having a baby would have been hell on a person who wanted to be fully dedicated to their career, as we both did at the time. And even now, in the years of tree-climbing, creek-playing and messy-science-experiment-inventing, I am glad to be an Equal part of the action. It is more difficult than being an Executive Father, but I still highly recommend it!

Update: based on a wise reader's comment below, I'd like to add this link, an anthem encouraging Wimpy Dads to realize what it means to become a Real One:
http://www.cnn.com/2011/OPINION/06/16/pearlman.fathers.day/index.html

Why You Should Smile at Higher Gas Prices

By Mr. Money Mustache

Thu, 16 Jun 2011 14:20:08 +0000

 There are lots of amusing stories in the news these days, as there always are when gas prices are rising. They often feature quotes like this, “I’ve got a 65-mile commute each way and these prices are making it impossible to put food on my table for my two kids!”, said Irene Smith as she finished pumping $134.00 of regular unleaded into the tank of her Chevrolet Avalanche.

Gasoline and other fuels have been so cheap for so long that most US residents have built their entire lives with no consideration for energy use at all.

- Got a job offer from a company 50 miles away? Take the job! That’s less than an hour commute at 75 MPH!
- Want your kids to go to the fancy charter school across town? Easy! It’s only 3 miles each way! (4 times a day, 200 days per year).
- Running out of eggs for the recipe you’re working on? Beh! Just grab the car keys and take the Minivan down to Safeway!
- Got a plumbing business and need to carry around a few wrenches and plastic pipes? Grab the V-8 powered Ford Econoline!

- Starting high-school and want to impress the rest of the football team? Try a full-size pickup truck!!

As a result of this completely casual attitude towards driving, American drivers average about 13,500 miles per year. PER DRIVER! Multiplied by the US fleetwide average fuel economy of about 26 MPG for passenger vehicles and with gas at $3.75/gallon, we have about $2000 going up in smoke each year, or $4000 for a family or 2-car couple. And gas represents only about a quarter of actual car operation costs, meaning closer to $16,000 per year of total vehicle expenses per family.

It is of course frustrating to feel trapped with a massive expense that suddenly rises. But the reason we should all want these prices to go up is to wake everyone up and stop the insanity. If we could get the car lover crowd to understand these four points, we would be set:

- Cheap oil has CAUSED the country to be designed in a gas-wasting manner. Hell, it's almost *rational* to live the way we do if gas were free and if there were no environmental consequences to burning it!
- The price of oil is going to go crazy occasionally, because of annoying hedge-fund speculators in the short-term, and because of a general shortage in the long run (world oil use is growing faster than production so there is not much safety margin left).
- Your gas pump price is based on the worldwide price of oil. Since we don't have much of the oil reserves, we can't influence that price much no matter how many wells we drill in our oceans and wildlife areas.
- Even if we COULD drop the price for a while with extreme oil drilling, we'd just be back at #1 – creating even more inefficient suburbs and cars to ensure a greater price spike once we are even more hooked.

If the price could stay high for a while though, our amazing industrial society would automatically adjust in the name of profit:

- more efficient cars would come to North America, as they already are in Europe (50 MPG diesels, plug-in hybrids and pure electric cars, no more SUVs and pickups)

- cities would fill in more efficiently, making it easier for people to bike and walk, and even public transit would work better because of more compact cities and higher ridership
- food that uses a lot of fuel to produce and ship would rise in price more than efficient foods – people would switch to buying the less energy-intensive food
- people would insulate their houses and builders would start taking advantage of free heat from South-facing windows, etc.
- Transport trucks would adopt aerodynamic modifications and drive more slowly – saving fuel and creating more payable hours for drivers
- world oil use would drop significantly, causing a lower equilibrium price – reducing the profits sent to oil-exporting countries, and keeping them for ourselves!

Overall, we'd use a lot less fuel, and find ourselves stuck in traffic less often. Less driving would mean lower road expenditures for governments and thus lower taxes. But we'd still be spending more on our lifestyle overall, which sucks because the beneficiary of our extra spending would be oil-exporting countries. The only escape would be through less driving, owning a better car, and more biking.. things that aspiring Mustachians are already doing more each day.

But what if there were a way to create all the benefits of the higher fuel prices, without actually increasing your cost of living? What if we could siphon off all the Saudi Arabia money and pump it back into our own economy in the form of lower income taxes, and even better education and healthcare?

Other countries have actually invented a way to do this – are you ready for this? It is called "Taxes on Gasoline". Yet for some reason, no US politician who suggests this great idea ever gets elected, so they have stopped suggesting it altogether.

I like to repeat these points in my own head when I do need to buy gas for my own car – normally less than once a month but about to become a daily experience during an upcoming cross-country roadtrip to spend the summer in Canada.

Finding a reason to feel good about high gas prices is a pretty neat trick. But if you ever hear a politician proposing that we all pay higher gas taxes permanently – support him!

Get Rich With: The Secret Food 'Stash

By Mr. Money Mustache

Fri, 17 Jun 2011 14:26:11 +0000

Yesterday I ran into a friend while perusing the Yogurt section of the local grocery store. It was around noon on a Thursday, and my friend explained to me that he had just come from his office job to grab a few necessities for lunch because he had forgotten to bring anything to work that day.

I was glad to see my friend, and also impressed that he had decided to hit the grocery store instead of a fast food joint. A Fairly Mustachian Move, compared to most people, who go out to lunch almost every work day, spending about $12 including food, drink, tax, tip, and car expenses. Plus an hour of otherwise productive time that could be used either to get ahead in their careers or go home earlier that night.

But I have a secret for you that is a thousand times more powerful than even a trip to the grocery store: The Secret Mustachian Under-Desk Food 'Stash.

You see, I have an unusually high need for food. As a tall man without the food-conserving advantages of Car Transportation or Television Leisure, I burn through a good number of calories each day.. which means during my career as an office worker, I had to become quite an expert at Delicious In-Office Eating. Each day I had to plan for a good Second Breakfast, Mid-Morning Snack, Lunch, Afternoon Snack, and Pre-biking-home Snack.

The solution I found was keeping a permanently stocked fridge hidden under my desk.

So here is how it works: You get a nice little bar fridge from your own basement, from a friend, or from Craigslist.

Stock the fridge with a loaf of whole wheat bread, natural peanut butter, a jar of good jam, some bananas, apples, carrots, cucumbers and any other snacking vegetables, almonds, hot sauce, cheddar cheese, nice yogurt, and even some Beer for when you work late with the coworkers. Also bring your own plate, cup, and cutlery.

Each Monday when you begin the workweek, bring in groceries to re-stock it as needed. If you ever forget this step, there are enough long-lasting items in there to allow you to improvise a lunch to get you through until restocking.

And Pow! You are suddenly on the career fast-track! You are always in a good mood at work because your mind and body are constantly kept in perfect running order with the utmost in nutrition.

You have freed an hour of each day to work smarter, and the $12 of savings per day will compound to about $45,000 over your ten year career. It would be more over an even longer career, but YOU will get to retire and move on to eating from your real fridge at home as I do.

I donated my own office worker fridge to a friend in need and I hope it is now contributing to someone else's early retirement.

What will YOU keep in your own secret food 'Stash?

Mustachian Motoring with a Manual Transmission

By Mr. Money Mustache

Mon, 20 Jun 2011 14:08:03 +0000

Becoming an excellent driver is a truly worthwhile pursuit – for both the added safety and the cash savings it provides. I still remember the the awe I felt towards driving as a young boy when my family went places together. When I was old enough, I'd like to sit up front, next to my Dad, and watch the actual driving take place. Whether we were rolling through the hilly country roads to get down to the beaches of the Great Lakes, or heading home late at night along a big-city freeway, Dad was always there keeping the family save with Excellent Driving, smoothly picking the right lanes, and matching the engine speed to the driving conditions with the Manual Transmission.

It was (and still is) a mystical experience, hearing the sweet mechanical whine of rising RPMs as the fuel hit the engine just as the clutch blended the power out to the wheels, watching the gearshift move back and forth through the slots, magically hitting just the right gear to catch some engine braking down a steep hill, boost the power for a winding ascending curve, or slip into a deep overdrive for an extended traverse through the countryside. From the the 1989 Honda CRX Si in which I learned to drive in 1989 through to the present, my cars (and motorcycles) have always had the Manual.

So you can imagine the way I feel about the current state of affairs, where in the United States less than **ten percent** of new vehicles are being ordered with the classic 5-or-6-speed. In fact, many of the best-selling US-specific models don't even offer a manual option, because there aren't enough drivers who even know how to use them. Instead, vehicles are competing by adding ever-more cup holders, bubbly exterior styling and little automatic features that do everything from closing the doors and trunk for you to managing your collection of strollers and diapers.

These vehicles are like junk food purchased from a convenience store. They are expertly engineered and extremely convenient, but in the long run they are sapping the health from the art of motoring, because they are taking the skill out of it. Because of this trend in the car industry, most people don't even learn to drive a manual, which in my book means they don't know how to drive at all.

Even more ridiculous and tragic is when I see my own friends buying automatic transmissions in cars where I know a manual is available. The Honda Civic and Fit, the Subaru Legacy, the Toyota Corolla. These are not cars meant to be outfitted with automatics! Why would you pay more to make the car shittier in every measurable way? There are only two lame excuses – you don't know how to drive one yet (so learn, by buying a manual and having a friend drive you home in it then teach you) – or you think you drive too much in rush-hour traffic (#1 – manuals are fun in all conditions. #2 – fix your lifestyle immediately so you don't drive in stop-and-go traffic, addressed by other articles here).

Let's be clear: I'm a family man, and I've got a wife and young boy myself. Like many people, my wife had been raised on automatics, but I helped her break free from this cancerous legacy by teaching her how to drive a real car early on in our relationship. Before committing to marriage. Even back then, I foresaw the difficulties that would arise if we had to share a fleet of vehicles for life, and only one of us could actually drive. An entire lifetime of silly automatics would have to be purchased – just because of one missing skill! So, within a week of that first awkward stuttering start down the road, she was impressively smooth on the manual. Today she has skills like a rally driver. I would advise younger manual drivers to do the same to for their potential mates while they still have the chance.

There are many other benefits to manual transmission expertise besides preserving your motoring expertise. You also get to keep a lot more of your money. An automatic transmission adds about a thousand dollars to the price of a new car. How long does it take you to save up a grand? I'll bet it's longer than it would take to become proficient on a manual transmission, which for most people happens with under 8 hours of on-road practice. Over a lifetime of driving, you will save yourself thousands upon thousands of dollars.

Selecting the manual also shaves close to 100 pounds off the weight of your car. Most cars have a power-to-weight ratio of about 20 lbs/horsepower. So you are effectively adding 5 horsepower to your vehicle by unhooking the equivalent of a large bag of concrete mix from the undercarriage. A lighter car also handles better and gets better gas mileage. With an understanding of internal combustion engines, you can keep the engine under higher load and lower RPMs during parts of your drive when an automatic would automatically go into a torque-slipping downshift . You are also liberated from the towtruck or the jumper cables if you ever leave your lights on in the parking lot and return to a dead battery, thanks to the "Bump Start" technique which is possible in manuals but not automatics. I'm not sure how many times I have thankfully bump-started manual cars and motorcycles over the years, but it is surely over a hundred.

You also get longevity. Automatic transmissions, with their incredible mass of gears, fluids, and computers, tend to wear out or malfunction before the rest of the car, and cost thousands to replace. A manual, if driven properly and maintained only very occasionally, can last a lifetime. In 2005, a friend of mine lent me his 1984 Nissan pickup truck. It still worked perfectly and the loan period ended up being almost six years. Last month I returned it to him, still in perfect working order, and shifting just as smoothly as the day it rolled off the line 27 years ago.

So it's time for us all to celebrate manual transmission cars. If you already drive one, congratulations! If you don't, be sure that the next car you purchase is manual if at all possible. Electric cars and Priuses don't come with manuals, and the model of minivan I use for construction was unfortunately never made with one, but luckily the most appropriate cars for YOU out there are mostly available with manuals. Fuel-efficient Honda, Toyota, and Subaru wagons and hatchbacks, bought on the used market, with manual transmissions. Ahh.. proper motoring, done in moderation.

But beyond all of these practical benefits, the Manual Transmission makes me happy because I can already see my own son starting to watch me shift as we drive, and copying the motions as he sits in the driver's seat shifting himself when the car is parked. Another real driver is in the making.

Frugality as a Muscle

By Mr. Money Mustache

Tue, 21 Jun 2011 14:14:00 +0000

 Oh, Mr. Money Mustache is pissed off today.

It's because he just stumbled across a competing personal finance blog that espouses blatantly Anti-Mustachian principles! And yet it has the audacity to call itself "I Will Teach You To Be Rich!"

Here's the article, called The Psychology of Cutting Back on Lattes, if you want to compare it to your own value system. And now we'll have some fun celebrating what is right about that article, and crushing what is wrong about it, in the rock-hard crevice between our biceps and forearms. Or perhaps sweeping the wrong parts off of the street and into the sewer with our stiff, bristling Money Mustaches.

First a word on the author, Ramit Sethi. I had never heard of this guy before, not being part of the regular commercial world, but it sounds like he has some MMM-type attributes himself, which I must admire. He is bossy, opinionated, and wise. He's a self-described Best Selling Author, which is also impressive, but not something I wish upon myself, because I don't want to *take* from you the very money I want you to *save*

But it turns out he has a different take on frugality. He is more into,

"Focus on the Big Picture! Spend your time figuring out how to earn more money! Then live a big guilt-free spendy life going to restaurants and buying things – deet-dee-deet-dee-deee, yeah! Fancy car, vroom, all right, Martinis tonight, let's go! Hop into my jet, let's fly first-class to London baby!!"

I must admit, he had me caught up there for a while. It did sound like a lot of fun, and it could be a worthy goal to aspire to – **IF –** the entire world was one big USA and money really could buy happiness and there was nobody more worthy to spend money on than myself and no shortage of natural resources for us all to burn up by increasing our lifestyles beyond the 500%-of-sustainable level that we're currently running at.

So anyway, in the article about Not Cutting Back on Lattes, I found lines like these:

"….What is the point of saving money on obsessing about small expenses like lattes? Is it to truly save money, or is it to reduce guilt?…."

"…. these trivially expensive beverages…"

"… yo-yo of spending, cutting back, and starting to spend again…"

"…The whole point of money IS to spend it on things you love. Pleasure purchases should not be a source of shame…"

Aha.. I see what Mr. Sethi is getting at. He shares the common misconception that buying things *makes you happier*, and not buying things *makes your life suck,* so it's hard to cut back on this Pleasure Purchasing.

If this were true, Mr. Money Mustache would not exist. I wouldn't be writing every day about this absolutely golden lifestyle that will both catapult you to Ultimate Happiness and save our entire species and planet, if it weren't actually fun!

The problem with the Big Income/Big Spender (BIBS) solution to riches is that it is a hollow victory. You are putting effort into earning ever-increasing amounts of income that could have been put into finding a meaningful life for yourself. You are buying shit that builds up in your closet (or in your arteries and your abdomen). You are channeling your precious mental energy into **consumption** rather than **producing ideas and things of your own**.

I will admit that the **Big-thinking / Be-great-at-everything-you-do** component of this philosophy is worthwhile and can indeed bring fulfillment. And after watching some YouTube videos of Ramit Sethi, I actually really like the guy. He is very funny and in real life seems to be quite down-to-earth. That's probably why people are excited about his blog and the bestselling book. But a true Mustachian can go much further than that.

You see, the Anti-Frugal ranting is the error. BIBS believers imagine frugal people as tragic little beings, whining and suffering out in the street in their potato-sack clothing, as they harvest leaves and sticks from the gutters and try to pound them into pulp with rocks in order to make their own toilet paper so they can save 26 cents per week. And they extend this 26-cent mentality even into rather big expenditures, like $1000 per year on take-out coffee.

Then these believers show what happens when the typical clueless Ultraconsumer tries his hand at frugality:

"Oh! I want to cut back my budget this week, so I'm buying less lattes. But Waaah! My stomach craves a latte! Oh, this frugality stuff sucks! I'm going back to my comfortable old life!".

And that's the end of the Ultraconsumer's pathetic attempt.

Well, yeah. It was hard for that person because their Frugality muscles were so weak and flabby and hidden beneath folds of Consumer Flab that they could not even flex properly. Just as I would be whining and falling down in the desert sand if I packed up tomorrow and decided to run the Death Valley Ultramarathon (a 135 mile running race done in temperatures up to 130 degrees Fahrenheit).

But what does Frugality feel like to someone who has developed their muscles? It feels absolutely amazing. It is Badassity itself, which means it is Happiness itself.

For example – today I got up, cooked breakfast at home, then with no shitty office job to attend to, was able to immediately hop on one of my bikes and head out for some errands under a bright sunny sky.

I visited my rental house to sign a lease with a new tenant, then biked to the bank machine to deposit some checks, then to the grocery store to buy some fruits and vegetables. It was a fantastic errand, since I took the scenic creekside route and ended up traveling almost 20 miles in a loop of half of the city to visit all of these places. And I did it at the highest possible speed, carving corners, jumping curbs, wind roaring in the ears, burning almost 1000 calories in the process.

Afterwards was lunch with my family, and then I took some time to do this week's load of laundry, which I enjoyed hanging up to dry as part of my personal anti-electric-clothes dryer vendetta. In the afternoon I played with my son in the living room, had some nice conversations with my wife, finished a woodworking project in my garage, then cooked a delicious dinner and later found myself typing this MMM article.

If you look it over, this was a perfectly frugal day – I didn't drive a car, I didn't buy anything other than carefully-chosen food from a grocery store.. no lattes, no martinis and steaks, no golf clubs or BMWs. I used very little energy and threw out no trash.

And **there was no deprivation at all** – I did not suffer or whine, or deny myself any form of pleasure. In fact, it was an absolutely stellar day. And I ended up healthier and richer at the end of it than when I woke up this morning. Sometimes I can hardly sleep at night, because my days are so fun and energizing. I have to get back out of bed and read and write some more stuff, just to process all the joy.

And as it turns out, almost every day is like this. There really is no suffering here, in this highly frugal life. Just a lot of rewarding work and effort and accomplishment. I'm not a Death Valley Ultramarathon Frugalist like Jacob from Early Retirement Extreme, but I still run a good race compared to my fellow countrymen, because my Frugality muscles are healthy and well-developed.

So how can we get the latte-swilling car-financing whining flab-bombs described on Sethi's website to start developing their own muscles? Your guess is as good as mine. Part of my attempt – this MMM blog – is to show people that there is a desirable end goal – early full or semi-retirement in full material comfort.

After capturing their imagination, we throw them into the Triple M Gym and lock the door. The workouts are a neverending stream of amusing reminders that you can't get here by buying your way in. Because it is far more efficient to save your way in instead – cut your big expenses like car costs first (as our competitor also advises), but then continue the accelerating trend as your muscles develop, until you find one day you are saving 75-90% of your take-home pay.

This Acceleration phase is what makes the difference between "early" retirement at age 60, vs. true Early Retirement only 10 years or so from when you do your first lift. Age 30 if you start at 20. You get happier even as you get better at the methods, and richer. Rinse, Repeat, Retire Early.

I've discovered from the comments that many of us already are fairly muscular in this department. But it is still fun to work out together, and to welcome any new folks just coming in on their first guest pass.

Why I Really retired from Corporate Work

By Mr. Money Mustache

Thu, 23 Jun 2011 14:38:12 +0000

 I've been reading some incredibly thoughtful and zoom-out-and-look-at-the-entire-human-race-from-the-perspective-of-an-alien articles on other blogs recently, and they forced me to re-think some of the reasons I quit my job as a computer engineer back in 2005.

Two of the articles, which I wouldn't recommend digging into while at your own work unless you are a very advanced slacker because they are so long, are these:

Are you Suffering from Careerism, at Early Retirement Extreme. Here the author points out that at some point in your career, your advancement or survival may start to depend on politics rather than performance.

The Gervais Principle, on a blog called Ribbonfarm, dives deep into a theory that all big companies are actually made up of only three very tragic-sounding levels of people. While quite bleak overall, the description is strikingly accurate and is really just a workplace-specific zoom-in on human nature itself – the annoying tendency some of us have to compete for power when placed into large groups.

The Dark Side of Early Retirement, on Financial Samurai, suggests that perhaps quitting your job is a result of being a bit of a wussy who was afraid to make it to the top, rather than a Mustachian Hero. He also points out that early retirees tend to go around promoting how good it is to be an early retiree, much like people who move to Florida talk endlessly about the warm winters. These tendencies sound pretty annoying so I'd better be careful myself.

When I read all three of these things together, it made me wonder a bit about my true motivations for quitting.

Was it because I was afraid I was not good enough, so I just quit instead? This is a sensitive topic, because I was still just a non-management employee by the time I retired – no major waves were created, no newspaper headlines were written, and I'm sure the other worker bees seamlessly swarmed in to replace my empty cubicle and pick up the work I left behind. The company didn't miss me a bit. Was I quitting because I wasn't good enough to reach the top?

Was it because I had started to see the true nature of big-company politics, and I didn't like them?
As a 19-year-old engineering student just finishing his first year of university, I scored my first engineering summer job at a very good company. It was an incredible thrill and I will never forget the utter joy of even entering a real office building. The big windows overlooking professionally landscaped grounds. The luxurious front lobby and fancy bathrooms. The electronic ID badges. And even the exotic low-pile office carpet and my very own cubicle and desk.

Objectively speaking, I can tell you that professional offices are actually fucking awesome places to work compared to gas stations and convenience stores. But over the years, you grow accustomed to the luxury and human nature starts to find things to complain about rather than just being permanently starstruck.

I call this the California Effect, where people from California and especially Los Angeles, are permanently jaded, because they were born in a place that is already absolutely beautiful, with mountains, ocean, non-stop perfect weather, infinite money, and a free society in which you can easily become a multimillionaire. The arrangements of tropical flowers which bloom and lick at your ears from even the lowliest McDonald's Drive-through are infinitely nicer than even the most advanced garden in my own hometown. But jaded LA residents insist on finding problems with it instead. And compared to Southern California, the rest of the country seems even crappier, because SoCal is actually the nicest piece of land in the country (note that I'm talking about geography rather than culture here).

So goes it in the office lifestyle as well. After I became used to the building and the cubicle and the oversized paychecks, I did start to notice that my efforts to improve company morale and profits were sometimes falling upon deaf ears. Many of the more senior managers of the companies I worked for seemed to be content with maintaining a peaceful status quo rather than really taking risks to improve the company. And that's when it hit me: at a big company, people are not actually trying for ultimate achievement.. they are trying to prolong a stream of paychecks because they are living a life that depends on several more decades of these paychecks to come in an uninterrupted fashion.

I did have the pleasure of working in some smaller and more dynamic-feeling companies earlier on in my career. Those were a lot more fun and I could imagine someone making a longer career out of hopping from one youthful place to the next, leaving only when the company grew too large to be fun. I did a couple of hops myself, but then the 2002 tech recession hit and temporarily extinguished the supply of start-up companies in my area.. so I settled in for a longer haul.

So yeah, I would have to say that the dull and neverending nature of big-company work is what did me in. It was definitely pleasant enough to endure for as long as I needed a paycheck. But after that point was passed, the gain was less than the pain so it became logical to leave.

My self-employment gig, on the other hand, is worth doing regardless of monetary factors. That's the kind of work that builds up energy rather than subtracting it, and sucks away abdominal fat and health problems rather than creating them. So I don't plan to ever quit that one.

What will YOUR job, or lack thereof, look like in retirement? It's worth thinking about from time to time, since you'll be getting the opportunity sooner than you might expect.

Mustache on the Move: Am I really the Most Badass Person in my Whole Town?

By Mr. Money Mustache

Fri, 24 Jun 2011 14:25:56 +0000

So the other Sunday I went out for some errands on the bike as usual. I had to hit the Big Box stores at the Eastern edge of town – Staples for an office necessity and Lowe's for a specialized light bulb.

It was a beautiful day. Sunny with dappled clouds. Temperatures in the mid 70s. Very light winds. Fresh tree and flower smells in the air.

The bigbox store development I usually visit is right along the bike path that runs through the center of town – that's why I use these particular stores. The path runs along a winding crystal clear glacier-fed stream which comes out of the mountains. It babbles and plays over a base of smooth round river rocks and sand, with the occasional little waterfall or stretch of rapids. As you whiz under the canopy of leaves formed by the tall creekside trees, if you're going West, you can look up at any point and see the Rocky Mountains towering above you. Their tops are still covered with deep snow and ice, which is melting in the hot sun to provide you with all of this nice water.

So it’s a pretty darned nice path to bike along, and by riding on this path and the rest of the network of connected paths, you can get to most of the useful parts of my town, barely even needing to resort to the wide, quiet, bike-lane-equipped streets.

And yet when I got to the big box stores, I found the parking lot stocked with about 100 mostly-expensive cars.. but not a single bike in the virgin gloss-black bike rack system in the premium storefront bike parking area.

I racked my mind to figure out why this could be.

“Is it a workday? Maybe these people are all commuters from other towns, just stepping out for lunch? Nope.. it’s Sunday.

Is it the weather? Nope, fucking gorgeous out here today.

The hard-to-reach location? Nope, there’s the bike path right there. Maybe people in my town can’t afford bikes? Nope, these are all expensive cars, and in fact even cheap cars cost more than bikes.

Is this a special store only for people with special mobility needs? Nope, the people appear to be walking between the cars and the stores (and even that is surely only because the stores don’t yet allow you to drive right in and select items from the comfort of your driver’s seat).

After considering all the alternatives, the only rational explanation I could come up with, for the fact that I biked to the store while everyone else drove, even in the most perfect imaginable bicycling conditions, is this: Mr. Money Mustache must be the Single Most Badass person in Longmont, Colorado.

I know, I know.. it sounded surprising to me as well, but what other explanation can you offer? And more significantly, do you have what it takes to be the Baddest in YOUR town?

Mustache Really on the Move: Heading to Canada for the Summer

By Mr. Money Mustache

Sat, 25 Jun 2011 14:20:42 +0000

Dear Mustachians,

Thank you so much for all the fun and motivation you've provided for both me and your fellow readers so far. We have a lot more adventures in Wealth to experience together.

I just wanted to let you know that I'm leaving today for the big annual trip to Canada (the Great lakes region of it specifically, including Hamilton and Ottawa). We've been going every year since retirement began, usually for 4-6 weeks in total. Families and friends mix and grandparents and grandchildren play. So at the very moment any up-to-date readers are reading this, I am probably zooming Eastwards on Interstate 80, crossing Colorado, Nebraska, Iowa, Illinois, Michigan, and then Ontario. Cool, Eh?

Each year I like to throw in a major construction project for a family member or friend to keep myself entertained on such a long trip. I call it

“Carpentourism”. So I bring up a carload of specialized tools to supplement whatever I can borrow once I get there. This year’s project is a fantastic little lakeside cottage that the inlaws had built up to the rough-in stage over the winter. I get to do the entire interior finish job including a kitchen, bathroom, and all sorts of fancy woodwork and doors, as well as all the various fixtures. Some of the work will be done alongside a nephew who just grew up to reach Little Man status this year, and even my brother (who, as a bit of trivia for you, happens to be the Canadian Indie Rock Star Wax Mannequin).

All of this travel will surely provide plenty of new fodder for the MMM cannon during the trip. But of course, the posting schedule will become somewhat more random. This cottage will take many hours of work, and there is also beer to be drunk, and the uneasy freedom of No Constant Iphone Internet Access that comes with being in a foreign country.

So, keep visiting and writing in, read some of the old classic articles if you find there are no new ones on a given day, and have a great summer!

My New 1000% Annual Return-on-Investment Clothes Dryer

By Mr. Money Mustache

Mon, 27 Jun 2011 14:38:49 +0000

this one on Amazon is most comparable.

It's widely known that I think clothes dryers are a big waste of energy. There's something about a device that sucks warm air from inside your house, pumps 5,000 additional watts of coal-generated electric heat* into it, and then shoots it outside into the cold winter air along with lots of nice humidity from your freshly-washed clothes, that just doesn't agree with my efficiency-oriented engineer's brain.

But there are two laundry practitioners in my house, and a certain lady was not quite as fond as me of spreading out dozens of preschooler socks and floppy tall man shirts on every available surface each week on laundry day.

So when Mr. Money Mustache was not in the immediate vicinity of the laundry room, he would often hear the electric clothes dryer kicking on somewhere in the distance.

You see, we both had the desire for natural clothes drying, but none of the right equipment to actually do it. So I have just been hanging up my wet clothes on hangers, towel racks, chairs, over doorways, etc, for the last few years. It's not quite as bad as it sounds: since we live in Colorado at over 5,000 feet above sea level, the dry low-pressure air sucks away the moisture in only a few hours, as opposed to the 1-2 days it could take to dry a poorly hung pair of jeans on the East Coast. Then I put all the clothes away.

But anyway, our problem has at long last been solved by an amazing $20 device purchased from Target. A sturdy metal rack that folds out to reveal a total of 28 combined feet of hanging space, in a compact footprint. Small enough for even an apartment. Set it up in your living room or bedroom for the weekly drying of the clothes, or whisk the whole thing outside for full-on solar fresh air drying. In the semi-desert summer sunshine, a full load will dry in less than hour – faster than an electric dryer!

Compared to using the dryer, this device will save you about 50 cents of electricity per load, and at the US average of 400 loads per year (!?), you're looking at $200 annually. As the title of this article suggests, that's a 1000% annual return on the $20 price tag.

Benefit of increased marital harmony due to no more fights about my clothes-hanging skills? Priceless.

*The US gets about half of its electrical power from burning coal. My own power is 100% wind-generated thanks to a nice option presented by my local electric company, but still, most people are stuck using coal.

Good Times for Landlords

By Mr. Money Mustache

Wed, 29 Jun 2011 17:04:52 +0000

fiddled around a bit with rental property ownership over the past six years. In that first article linked above, I had a somewhat neutral view on the practice, figuring it was definitely good money, but it took real work to get it.

But I've been noticing an interesting trend in recent times which is forcing me to upgrade my opinion on the value of Landlording a bit. You see, one of my local friends is a fellow creatively self-employed-businessman who has a few rental houses as well. Last year, one of his houses was in bad condition. It started out as your typical 1950s ranch house with an inconvenient chopped-up-into-small pieces floorplan and pretty modest interior finishes. Then it endured several years of rental from a very, ahem, creative large family who added plenty of additional wear-and-tear. By the end of all this, it was getting into "dump" territory, complete with weeds'n'dirt lawn and several large truckloads of leftover junk belongings.

Since it was in a nice neighborhood, he decided that instead of just doing a major cleanup, he wanted to give it a Total Mustachian Makeover. I got to be the main carpenter, keeping my own construction career as busy as I could handle. We brought in some helpers and a dumpster, and ripped out all the unnecessary walls, as well as the junky bathrooms and much of the barely functional plumbing. Everything was nicely rebuilt, with new luxury baths, a great functional kitchen overlooking the newly opened large living room and dining area, almost-new used appliances from Craigslist, and a full landscaping and interior/exterior paint job. Even the basement was finished and painted to add to the useful space.

We did all of this on a shoestring budget, reusing and refinishing materials whenever possible (such as the original 1950s-classic natural wood kitchen cabinets), getting some from a recycled building materials facility called ReSource, and buying the rest from the usual local stores as cost-effectively as possible.

The result was quite a hit, and as soon as we finished the renovations, he was able to re-rent the house at a much higher rate, to a more qualified set of tenants. With the higher rental rate, the cost of the renovations actually will deliver a 10% annual return for as long as the house is rented, then return more than the original capital amount in the form of a higher sale price when the property is eventually sold. Since he rolled the cost of the upgrades back onto the mortgage with a rate far below 10%, the renovations were actually a no-cost way to increase the value and the cashflow of the property – a neat trick indeed. I would recommend this trick to you too, if you ever buy a distressed property to rent out, as long as the numbers work out properly. I can help you with this analysis if you like.

This summer, it was time for my friend to re-rent the upgraded house a second time. He put up the usual Craigslist ad, and was immediately flooded with many responses from eager tenants. He very quickly found a new tenant, and the house is again producing great income.

Then it was my turn for a positive surprise. My own rental house has had a wonderful 2010-2011 season. Fantastic, reliable tenants with no funny business whatsoever, and the house looks better than when they moved in. I was scheduled to re-rent it in August, but last month I got a call from another highly qualified resident of the same neighborhood asking if he could rent it from me as soon as the current lease was up, since there is now a shortage of available homes to rent in the area. The rental rate has been raised to keep up with inflation, a new lease has been signed, and the MMM family's grocery money is locked in until at least August 2012. Yeehaw!

And now we're getting back to the original point of this article. Every anecdotal story I've heard has pointed towards an unusually strong rental market. So I did some further research on the matter, and found further confirmations on this on the Denver-wide level and even the US National level.

According to those articles, the combination of foreclosures and employment growth has brought lots of new renters to the market, presumably even greater than the number of people who have decided to rent out houses rather than trying to sell them as a way of waiting out the slow housing market.

For me, there are two lessons in all this:
#1 – Being a landlord is more fun than I had previously estimated
#2 – Even in weird economic times like the present, there are often little pockets of gold to dig up and enjoy if you stay optimistic and aware of your surroundings. Nobody could have predicted back in 2008 that the housing market crash would lead to Good Times for Landlords in my town, but here we are.

The key is to realize there is always opportunity to be had out there, so don't waste any of your mental energy worrying about how bad things are or which gigantic world financial catastrophe to worry about next. Instead, keep your set of useful skills and your savings growing, and your eyes open. Happy 'Stashing!

First Retire, Then Have Kids

By Mr. Money Mustache

Fri, 01 Jul 2011 10:38:48 +0000

I've been broadening my blogging horizons a little bit and reading what other people are writing. One blog that caught my eye is Frugal Dad. I like the title and the great variety of topics he has covered over the years, in a nice easy-sipping style.

The Frugal Dad is a guy who started out mixed into the consumer culture, and as a result ended up with an uncomfortable amount of debt, before he hit the brakes and started turning things around.

It's a nice contrast to Early Retirement Extreme (the first place where I had the opportunity to do a guest posting) and Mr. Money Mustache, since ERE and I both embraced the frugality plan right from the start, thus missing out on many of the hard knocks and life lessons that are dealt to people who mix it up with The Consumer Credit System

So I wrote to the author, and he graciously agreed to post an article from me on his site.

Update: The Frugal Dad site changed style and ownership over the years, so here's a copy of the article that I published on his site:

First Retire, Then Have Kids
by Mr. Money Mustache

I have a far-out idea to share with the next generation of the American middle class.

Right now, I'm speaking specifically to the young people who are finishing up a college degree, perhaps in a promising field, and starting to get interviews for jobs with salaries they could only dream of just a few years earlier. The Adult World lies exciting and vast before you, and the Opportunities are unlimited!

At this point, let's imagine you just dive in and start playing it by ear. You work hard at the new job, buy a new car, rent an apartment, enjoy restaurants and vacations, and may even save towards the downpayment on your first house.

There is usually a student loan still kicking around, and then a car loan, and maybe even some credit card debt that pokes its head in at some point. Meanwhile your new career advances quickly and within a few years you've almost doubled your new graduate salary – perhaps you are now making $60-100k or more.

Eventually, you might pair up and move in with your true love, so that you are now sharing one nice place. Maybe it's even your very own home. Now you're about 30, and you are one of the lucky households with an income of well over $100,000 per year! But you've still got two student loans, two car loans, assorted other debts, and when you add everything up, you still have a net worth of less than zero.

You are thinking of starting a family, but something doesn't feel right about your financial security. How did you work so hard for almost ten years and still end up having less than zero dollars? At this point, you turn to the Wise World of Financial Bloggers to see how to clean up your act. And you begin the long slog to get out of debt, just as your expensive first baby is born…

But since this surprisingly realistic example is still just fictional, let's stop and rewind it back to the beginning. What if the college student or recent graduate could receive the life-changing advice of one of us Thirtysomething financial bloggers, and use it to their advantage? What knowledge could the wise blogger impart?

Here's what I would say:

"Hey young fella (or lass). It's me, Mr. Money Mustache. Congratulations on entering the fantastic world of Real Work!

But before you take off running, take a look over here on the side of the grand hallway we're standing in. There's a little doorway that most people don't even notice, called Real Wealth. If you take that particular door, you have the opportunity to become quite rich by the time you're in your early 30s… right around the time the rest of your friends are just realizing they must have done something wrong because they are still recovering from debt!

In fact, the situation through this door is so good, that you can even quit work entirely in order to spend time with your future children, and for the remaining 70 years of your life, work will be an enjoyable and optional part-time affair of pursuing your true passions in life. Sound good?"

As the New Graduate, you would probably be pretty excited to go through that door. It would put you on the path to True Early Retirement. Instead of spending all your money, I'd advise you to live on about $15 to $25 grand of take-home pay per year, and if you pair up into a couple, the number would become $20-$35k.

The rest – and I mean ALL the rest, regardless of how much you earn, goes into your early retirement fund. Maximum contributions to the 401k, and to Roth IRAs, and then beyond that to more low-churn growth investments that don't generate taxable gains. Maybe even a rental house or two if you really want to be on the Bullet Train plan.

A plan like this may sound quite tricky if you're currently stuck in the American Ultraconsumer mindset. But as someone who followed this exact path myself, I can tell you it is absolutely enjoyable, fun, and even still quite luxurious. I still owned houses and reliable cars and a nice bike, and did a reasonable amount of restaurant eating and travel through the whole process.

The only difference between me and my indebted thirtysomething peers is that I was much more careful about considering each purchase to avoid wasteful ones, and I was adamant about never borrowing for anything other than a house. And I married a woman who was willing to live the same fun lifestyle to reach the early retirement goal together.

The ultimate reward for us came with the birth of our baby boy in 2006. We had already retired from our real jobs and could share the joy and pain (OK, mostly pain for the first few months) of parenthood together, with none of the compromised career-juggling lifestyle that defines our country.

We actually do enjoy working, and still do a small and non-mandatory bit each week to bring in extra savings and interact with other adults. But taking the entire pressure of finance out of your life so early on, so that you can enjoy the next SIX DECADES focusing on more worthwhile things, is a worthwhile thing to shoot for as a new graduate.

So which door will you choose, Next Generation of the Middle Class? Will it be more of the same old same old, or do you want to try it the Mr. Money Mustache way?

Wish You Were Here

By Mr. Money Mustache

Fri, 08 Jul 2011 15:38:53 +0000

 Oh, hello there.

I just noticed it's July 8th, which means we're already about two weeks into the annual MMM family vacation. It has certainly been reflected in the wimpy blog posting schedule, even while readership seems to be on a growth spurt due to the influence of Frugal Dad. There have been times in the last week, out swimming in a remote lake far from any internet access, that I forgot I was even Mr. Money Mustache!

This vacation has been making it easy to forget, since I've been living a very non-Mustachian life for the duration. Leaving the cushion of my simple life at home and the harmonious vibes of you, the Triple M readers, I've been confronted by the Real World, which unsurprisingly has continued on its regular self-destructive path even as we have been quietly grooming our 'Stashes in secret.

I managed to stay in character for the first day. After burning up a season's worth of gas driving the construction minivan a quarter of the way across the continent, I reached Des Moines, Iowa at around midnight. Inspired by this blog and not organized enough to find a reasonable hotel there for less than $100 on short notice, I decided to kick it Trucker Style and camp out at a rest stop for the night. I had never tried this before, but it was a huge success. I wish I had discovered this trick years ago! I cleared out a bed-sized area in the back, rolled out a camp pad and cozy pillow and blanket, and slept like a king with none of the hassle of check-in, check-out, and with the knowledge that nobody was washing an enormous load of sheets and towels and disposing of plastic bags and cups on my behalf just so I could sleep for seven hours. To add to the luxury, the rest stops in Iowa have free wi-fi internet access and good quality bathrooms.

Early the next afternoon, I reached Chicago, where I visited a friend who lives in the center of the city. He took me out for a day at the lakeshore where we rode the clackety Chicago commuter trains, ate several deep-fried meaty snacks at the Taste of Chicago festival, exceeded our weekly beer quotas, biked through a five mile human traffic jam of bikinis and rollerblades, parked at the harbor and battled the wind and waves for a while in a speedy powerboat, then eventually drove back to his house in a very expensive car. That night we consumed several more kinds of meat and desserts thanks to the Mexican Barbecue party hosted by his lovely wife, then slept a gluttonous sleep while the air conditioning ran continuously.

Since then there has been plenty more visiting, with everyone including me doing wasteful amounts of empty-car driving, eating and drinking. Many family members have been continually purchasing items from stores – kids' water toys, shoes, hats, desserts, outdoor chairs, whatever comes to mind. In short it has been a completely normal mingling of middle-income North American families.

I found it interesting to note that even with gas in Canada being about $4.70/gallon US, the consideration level given to driving is no higher – suggesting that our own prices would have to rise above that level before any major changes happen.

Despite the observations above, this trip has been the best one of my life so far. The happy combination of old adult siblings getting together and celebrating their graying beards and lengthening life histories over spicy homemade food and forest-shaking laughter, young children meeting each other for the first time and becoming friends, and lots of hard work and exercise, is unbeatable. Oh, and of course the fact that early retirement is the thing that allows us to go on these long trips in the first place.

But I have noticed a significant pattern: the best part of family visits is not the part that involves buying things. If we could change our habits to include carpooling to the lake, using the toys we already have instead of buying an endless stream of new ones, biking more and powerboating less, and eating more natural and local food, we'd still have just as good a time. Probably even better, since there would be more challenge and creativity packed into family visits.

So there's another **MMM challenge** for me, and maybe for you too: try to motivate your family this summer, to become just a tiny bit more Mustachian, for their own benefit. Bring a stack of your real plates to the picnic instead of plastic and styrofoam and throw them in your dishwasher when you get home. Make one kickass pesto dish in place of some of the meat. Bust out the canoe instead of the motorboat. Trick your elderly parents into going for a short bike ride with you. Pick a closer destination for your group camping trip if you can find one. See if you can max out the fun without maxing out your consumption of dollar bill employees and chunks of the Earth. I will do the same, and report back on the progress.

Happy Summer!

Brewery Update: Beer ready, Critics Raving!

By Mr. Money Mustache

Mon, 11 Jul 2011 14:42:59 +0000

 brewing our own beer. During that first session, we did all the major barley-flake boiling, malt syrup dumping, hop-infusing and yeast sprinkling, then left the 5-gallon mixture sitting in a jug in my cool dry basement to ferment for four weeks.

In what is still one of humankind's greatest accomplishments, this mixture magically became beer. Following the instructions from the Bald Brewer, we then siphoned it to a second 5-gallon container and let it sit for a couple more weeks. Then it was time to put it into the bottles.

On the day before I left for my current vacation, The Triple M Brewing Team gathered a third and final time to boil up a 5-ounce mixture of sugar and water to mix with the beer and then siphon the whole deal into a long line of very clean and sterile 22 ounce bottles. I connected a new faucet supply shutoff valve to the end of the siphoning tube to allow precise filling, an improvisation which seemed to work well. We used the cap-installing device from our Craigslist homebrewing kit to seal each bottle once it had been filled.

Then it was time for the third and final conditioning stage – leaving the bottles for a couple of weeks in a dark but non-refrigerated place. Here the extra dose of sugar apparently feeds the remaining yeast which releases carbon dioxide into the sealed bottles, yielding properly bubbly beer.

Each Mustachian took home his own share of the bottles. Mine are (I hope) still bottle-conditioning in my basement and I'll visit them when I get home. But I got an email this week from Mike, who cracked one of his bottles a little early.

He reported that the quality is Stellar! This was unexpectedly good news for me, since it was only our first attempt at brewing. It seals the deal on our future of homebrewing, since the whole experience was quite fun, and fairly speedy and cost-efficient as well.

As for the beer itself – it is called "Eighth Avenue Amber", after the store location of the Bald Brewer. From our sampling during the bottling stage, I determined that it is a moderately dark beer with nice Grownup flavor, and a good amount of hoppiness as well. Not anything like Sierra Nevada hoppiness, but more than plain dark beers like Negra Modelo. Note that I am in no way a fancypants food or beverage writer so I don't know the special words for describing these things. But that is how I like it, since in general I shun fancypantsiness in any form.

I would like to publicly challenge the other three brew team members to begin the next batch RIGHT NOW while I'm away, so we can get four weeks of fermenting done before I return to Colorado! And now that we've completed the full cycle, I can safely recommend home brewing to other do-it-yourself types who have considered this hobby as well. It's not an ultra-productive money-saving technique like biking to work is, but at least it is a great challenging hobby that pays for itself and encourages gathering with your friends – exactly the type of hobby that you need on the path to becoming a multi-talented and wealthy Early Retiree .

Living better than your neighbors on 75% less

By Mr. Money Mustache

Thu, 14 Jul 2011 14:35:07 +0000

If you Try Sometimes…“, I briefly described my goal of living life at a cost of 75% less than “normal”. Since then I have received many questions:

What is Normal anyway?
Where did I get this 75% number?
Is it ridiculous or is it easy?

First of all, there are three major reasons that I set the target at 75% off:

- After measuring my own spending compared to others in the same income/assets group, I found that my own family seems to spend about 75% less overall, and yet we still seem to have a happier and healthier life than average, and plenty of material comforts as well. We have mostly cut out only the Wasteful Bullshit like cable TV and diamond rings and such, while keeping the things like a nice place to live, good food and health, good times with friends, etc.

- When reading books about the Earth's climate and ecosystem, I find the general estimation is that rich-world residents are consuming natural resources at 400-500% the rate that the planet can regenerate them for us. So to be decent citizens of the Earth and use only our fair share, we need to cut our average consumption by at least 75%.
- Since the default US household saves juuuust about 0% of its income, you will end up saving about 75% of your income if you can reduce your spending by 75% below these defaulters. For each year you save at this rate, you have bought three years of retirement. With compounding, you will have 25 years of living expenses saved in about 7 years, which will generate enough passive income to pay for your lifestyle forever, even assuming only a 4% annual dividend/withdrawal rate.

Now to get into some interesting specifics. An MMM reader recently sent me a link to an eye-opening spreadsheet at the US Bureau of Labor Statistics. It is called the 2010 Consumer Expenditure Survey. You can check out the whole spreadsheet at this link, and for casual readers we'll dive into a fun column from it right here.

My favorite column is the "$70,000 and above" one, since it turns out to represent an average household income of $129,528 before taxes. The solid well-to-do middle class two-income working family that Mr. Money Mustache hears from so often. The people that complain that they need two incomes to put food on the table, and that President Obama claims are suffering so dearly due to 8% unemployment and $3.75 gasoline. The same people that could be retired in 5-10 years if they could grow themselves a Money Mustache.

So let's go through the annual spending of our high-income compadres and see where we can make fun of them:

Income before taxes $129,528
Income after taxes $123,705 ***<-Admittedly an odd number – probably includes clever use of loopholes and excludes state and FICA taxes.***
Age of reference person 47.3

Average number in consumer unit:
Persons 3.1
Children under 18 0.8
Persons 65 and over 0.2
Earners 1.9
Vehicles 2.7 ***<-Wow, an average of almost 3 cars for a 3-person household. Nice!***

Housing tenure:
Homeowner 86
With mortgage 68
Without mortgage 18
Renter 14
Average annual expenditures $82,060

Food $9,761
Food at home $5,236
Cereals and bakery products $701
Cereals and cereal products $235
Bakery products $467
Meats, poultry, fish, and eggs $1,125
Beef $301
Pork $204
Other meats $158
Poultry $210
Fish and seafood $199
Eggs $53

Holy Crap! $1125 of Meat! My pricey cage-free organic eggs do add up to $200 per year, but the rest of the meat and fish is only $250 at most. Our total grocery spending was about $3800.

Dairy products $577
Fresh milk and cream $189
Other dairy products $388
Fruits and vegetables $928
Fresh fruits $320
Fresh vegetables $304

Processed fruits $162
Processed vegetables $142
Other food at home $1,904
Sugar and other sweets $203
Fats and oils $138
Miscellaneous foods $1,014
Nonalcoholic beverages $455

Food prepared by consumer unit on out-of-town trips $95
Food away from home $4,525 <-***Whoa – their restaurant budget is more than my whole combined food budget! MMM family restaurant spending was $525 last year.***
Alcoholic beverages $765 ***<-Surprisingly, this is within the $9/week/person MMM drinking limit :-)***

Housing $26,386
Shelter $15,916
Owned dwellings $12,306
Mortgage interest and charges $7,171
Property taxes $3,231

Maintenance, repairs, insurance, other expenses $1,904
Rented dwellings $2,098
Other lodging $1,511

Utilities, fuels, and public services $4,849
Natural gas $683
Electricity $1,729
$1729 in Electricity is an interesting number. Even for 100% wind power, I'm still comfortably burning less than $300 per year.

Fuel oil and other fuels $199
Telephone services $1,556
Water and other public services $681
Household operations $1,873
Personal services $794
Other household expenses $1,079
The following section is a good candidate for some serious chopping

without compromising quality of life. A thousand dollars of housekeeping supplies? I am more in the zero-to-ten dollar annual range here.
Housekeeping supplies $1,018
Laundry and cleaning supplies $214
Other household products $583
Postage and stationery $221
Household furnishings and equipment $2,730
Household textiles $214
Furniture $611
Floor coverings $67
Major appliances $314
Small appliances, miscellaneous housewares $153
Miscellaneous household equipment $1,371

Apparel and services $2,850
Men and boys $644
Men, 16 and over $511
Boys, 2 to 15 $133
Women and girls $1,156 ***<-Dang.. lots of independent runway models in the average household I guess.***
Women, 16 and over $966
Girls, 2 to 15 $189
Children under 2 $127
Footwear $460 ***<-Six pairs of $75 shoes every year? Wowee. My $75 Timberlands from 2003 are still going strong after over 2500 miles of walking, thanks.***
Other apparel products and services $464

Transportation $12,603 ***<-My whole debt-free vehicle fleet, including a year worth of gas and insurance, is worth less than this.. and it will be about ten more years before I need my next car at current driving levels.***
Vehicle purchases (net outlay) $4,775
Cars and trucks, new $2,712
Cars and trucks, used $1,953
Other vehicles $110
Gasoline and motor oil $2,881 ***<-MMM family this year: $650 because of major road trips.***

Other vehicle expenses $3,976
Vehicle finance charges $477 ***<-You borrowed money for your car even while buying six pairs of shoes?***
Maintenance and repairs $1,162
Vehicle insurance $1,503

Vehicle rental, leases, licenses, and other charges $833
Public transportation $971 ***<- This includes plane tickets. Unfortunately we are probably up near the average here.***

Healthcare $4,393
Health insurance $2,380
Medical services $1,212
Drugs $621
Medical supplies $180

Entertainment $4,733
Fees and admissions $1,363 **<-Hint: Forests and Mountains are usually free!**
Audio and visual equipment and services $1,416
Pets, toys, hobbies, and playground equipment $1,146

Other entertainment supplies, equipment, and services $809

Personal care products and services $991

Reading $182

Education $2,257

Tobacco products and smoking supplies $371

Miscellaneous $1,351

Cash contributions $3,176

Personal insurance and pensions $12,241
Life and other personal insurance $607
Pensions and Social Security $11,634

Sources of income and personal taxes:

Money income before taxes $129,528
Wages and salaries $111,256
Self-employment income $7,408

Social Security, private and government retirement $6,155

Interest, dividends, rental income, other property income $3,343

Unemployment and workers' compensation, veterans' benefits
$400

Public assistance, supplemental security income, food stamps $123
Regular contributions for support $489
Other income $355

Personal taxes $5,823
Federal income taxes $4,187
State and local income taxes $1,317
Other taxes $321

Income after taxes $123,705

Addenda:
Net change in total assets and liabilities -$10,318 ***<-So somehow, this average wealthy family still ended up in the red this year?***
Net change in total assets $15,608
Net change in total liabilities $25,926

Other financial information:

Other money receipts $845
Mortgage principal paid on owned property -$4,552
Estimated market value of owned home $274,601
Estimated monthly rental value of owned home $1,413

Gifts of goods and services $2,119
Food $189

Alcoholic beverages $17
Housing $353
Housekeeping supplies $50
Household textiles $17
Appliances and miscellaneous housewares $29
Major appliances $8
Small appliances and miscellaneous housewares $21
Miscellaneous household equipment $80
Other housing $178
Apparel and services $392
Males, 2 and over $95
Females, 2 and over $145
Children under 2 $71
Other apparel products and services $82
Jewelry and watches $27
All other apparel products and services $54
Transportation $177
Health care $39
Entertainment $173
Toys, games, arts and crafts, and tricycles $62
Other entertainment $111
Personal care products and services $18
Reading $1
Education $626
All other gifts $134
————————

All silly comments aside, it is a very useful spreadsheet that the BLS has created here. Even the first column in their online version, describing the overall nationwide median which turns out to be roughly a $60,000 family income, contains lots of stuff with room for chopping. Rather than doing an across-the-board chop, I find that my own spending ranges from close to 100% in several areas, all the way down to 0% in a large swath of expenditures. All told, we currently live on $20-25k per year, plus a mortgage-free house, as described in the Exposed! article. We consider this our Luxury Retirement spending level – if we were still saving for retirement the level would be considerably lower, as yours should be on a per-person basis if you are not yet financially independent!

How Not to use your Air Conditioning

By Mr. Money Mustache

Mon, 18 Jul 2011 12:53:05 +0000

Happy July 18th. It sure is hot these days, isn't it?

Statistically speaking, a good portion of the continental US and Canada has its hottest average day of the year right around now. So I thought it was a good time to share some thoughts on the modern household's biggest energy consumer in July – the Air Conditioner.

See, normally I'd assume that we're all adults and we're able to decide for ourselves how to run our own appliances. But after being on my current summer vacation for over three weeks and visiting a large number of family and friends throughout the not-overly-hot Great Lakes region, I've noticed that most people leave their goddamned air conditioners running 24 hours a day, whether it is warm or cool outside, with their houses at a stupidly low temperature. Yes folks, it has become obvious that America and Canada both need a lesson from Mr. Money Mustache on how to use their Air Conditioners.

I recently measured the power consumption of the central A/C system in my own house. Mine is a "3-ton" (36,000 BTU/hr) system which dates back to about 1998, when my house was built. At the time, it was considered fairly efficient with a seasonal energy efficiency rating (SEER) of 10. Newer units, thanks to EPA rules, are now much better with ratings of 14 and higher – changes the SEER rating translate almost directly into similar percentage decreases in your cooling costs. When in full operation, my system uses 3,000 Watts (3kW) of electricity, about 500 of which is my furnace blower pumping the cool air around the house (and adding its 500 watts of heat back into the cool air stream, by the way).

For those without electrical engineering backgrounds, 3,000 watts is an Absolute Shitload of electricity. It's enough to run 230 modern light bulbs simultaneously, and it's equal to having about 15 monster-legged tour-de-France-level cyclists hooked up pumping at race level on bike generators continuously in your basement.

At the national average price for electricity of 12 cents/kWh, my air conditioning system burns 36 cents per hour, or $86 per month if used for 8 hours per day. With a three-month cooling season, this would compound to SEVERAL THOUSAND dollars of wasted electricity every ten years. Yet my TOTAL average electric bill in summer, despite an average daily high temperature of almost 90 degrees in Colorado, is really only about $35. How could this be?

The answer of course is that I have just cut out the waste, without sacrificing any real happiness or comfort.

Here's how comfort works. Your body generates heat just by being alive. It needs to maintain its internal temperature at around 98 degrees F, and it depends on the skin surface temperature being lower than this to dump extra heat into the surrounding air. Producing sweat helps you cool the body faster, since the sweat sucks up heat as it evaporates. Humid air cannot evaporate your sweat as quickly, which is why it feels hotter. All basic elementary school science, right? This is why the Southeastern United States is a sucky place to be in summer even at 85 degrees F, while the desert states can feel quite comfy and invigorating at that temperature.

Finally, your body becomes more efficient at cooling itself the longer it spends at higher temperatures and humidities. Every summer as I drive from Colorado down into Nebraska and beyond, I break out into a great sweat and need to crank the car A/C. Even at midnight when the temperature drops into the sixties, I still can't stand the humidity and need to continue the air conditioning. But within two days, I am comfortable with the higher humidity and I enjoy a regular Eastern summer with no difficulty. As July progresses and things get hotter, I am usually visiting a portion of my family with no A/C, so my body continues to adapt. There are a few days when the temperature is so high that I get uncomfortable, but then I spray myself with the garden hose and drink a gallon of water with ice cubes and all is well.

I also take advantage of the natural cycle of the environment. In the US Northeast and Canada, and even more in the Western desert areas, the temperature usually drops at night. So non-A/C users take advantage of this fact to open all their windows, and use large fans (100 watts) to exhaust heat and draw in cool air to chill the entire interior contents of their homes. A 100 watt fan blowing outwards from your highest window is pulling in night air from all other windows that is 10+ degrees cooler than your house. By sucking in thousands of cubic feet of cool air per minute, this fan is doing almost as much cooling as the 3,000 watt air conditioning unit that does the same job during the day time. The Naturally Cool crowd also makes a point of enjoying more outdoor food cooking and clothes drying on hot days, to further reduce indoor heat sources.

This is to be contrasted with the behavior of Air Conditioning addicts, who set their thermostats to a silly temperature below 80 and let that baby run, night or day. They might turn it off at night, but forget to open the windows, so they miss out on the free night-time cooling. I remember staying over at one friend's house in June and heading out for a midnight errand. It was so cool outside that I needed a sweater. Yet his air conditioner was still running, pumping out the remaining heat from the 90-degree sunny day that had just passed. Meanwhile his body was not bothering adapt to summertime heat and humidity, because his house was always refrigerator-like inside. All of this is completely unnecessary!

The Mustachian Way is to think of Air Conditioning as a pleasant luxury to be used when all other efforts fail. Much like a car. It should be an exciting moment in your household, when every one is drinking their gallon-sized containers of icewater, wearing comfortable and summery outfits of bare feet and tanktops, and the ceiling fan is running, when you proclaim, “God Dammit it is hot today!! Let’s turn on the AIR CONDITIONING!! YEAH!!!!”

Then you run it for an hour or two, and the sun goes behind a tree, and you shut it back off again. And you open the windows that night and run the fan and go on with your lives.

If this sounds like too much hassle to you, grow some Frugality Muscles, punch yourself in the face, and try again. This is my Earth you are messing with, and your own Money Mustache you are burning off in the boiler of your local Coal-fired power plant.

Stay Cool!
love,
Mr. Money Mustache.

Get Rich With: Carpentry and Home Renovation

By Mr. Money Mustache

Wed, 20 Jul 2011 12:38:05 +0000

 Ahh, Building Things.

It's a hobby I have talked about many times before, but a recent experience has completed the transformation of carpentry from "enjoyable pastime" all the way up to "Lifetime Religion" for me – something that deserves its own article and its own place on the bookshelf of Top Ways to Be a Happy Early Retiree. Not everyone is born with the urge to build or create physical things, but a surprising number of people do have this desire, sometimes hiding unused beneath the crispy exoskeleton of consumerism that has been burned onto most of us by the Crème Brûlée blowtorch of modern marketing.

It was about 1:00 AM sometime last week. I was alone in an under-construction cottage sitting atop a steep hill overlooking a peaceful and almost mirror-smooth lake. The full moon's reflection shimmered just slightly in the tiny surface ripples. All windows were open and the cool midnight forest air streamed into my bright work area where I was carving out the hinge recesses on some new pine doors to be installed into the bedrooms and bathroom. I had been working feverishly for about 8 hours at this point, and hours felt like seconds, and thirty-seconds of an inch felt as big as the universe, I had become so thoroughly sucked in. Great music played nonstop from my construction radio, which I keep stocked with about 300 albums worth of mp3s. The only interruptions were the occasional pauses to roll up and eat another burrito and input/output another quart of water.

At long last, after finishing an enormous swath of flooring, cabinetry, door installation, and miscellaneous side projects, I started to get somewhat delirious and ready for some sleep so I unbuckled the toolbelt, and surveyed the day's accomplishments.

"Holy Shit", I said, "I sure do love building things."

And then I passed out on a mattress and slept for about 9 hours before beginning the cycle anew.

Some budding Carpenter Retirees among you have picked up on my love for the craft and asked me questions in private emails asking how I got into it. The question comes up often enough that I thought it would be worth sharing here.

Personally, I became hooked as a kid building my first science fair project somewhere around age eleven. It involved a wood and glass terrarium with a hinged lid which was far more fun to build than the ensuing experiment involving growing bean plants.

From there I moved on to start building various pairs of speakers in the tragically small and cramped cellar of my parents' old Victorian house. (I think this trauma is what caused my current love of big, clean, open rooms – especially basements and garage workshops). Later I renovated the attic of that same Victorian house to create my Teenage Bedroom, which provided years of fun. All of this early work would look flimsy and ridiculous by adult standards, but it sure did get me hooked.

Then there were the Dark Years – four years of getting a university degree, and an additional four of living in apartments and shared houses, moving frequently, and focusing mostly on being a normal office-working engineer.

But in the year 2000, I bought my first house. A comical 1978 fixer-upper complete with brown wood paneling, leaky aluminum windows and plenty of vinyl and carpet flooring throughout. Over the next five years I spent most of my free time ripping out or refinishing every single visible surface inside and out, and scrapping all of the unnecessary walls as well. I got to learn most of the construction trades by rebuilding it to meet my own fairly modernist/nature-inspired tastes. My wife and I loved it there. There were frequent house parties in those childless twentysomething days and it was fantastic to get to give tours of the house and all of the finished projects.

From there the hobby grew further, when in 2005 I started a small housebuilding company to build modern Earth-friendly houses in a local neighborhood called Prospect New Town, and did most of the carpentry work on the two houses built by the company. I had hired this great old carpenter to do the framing on the first project, and I worked side-by-side with him from the sill plates right up to the last pieces of fine wood trim on the interior, an experience which really gave my skills a boost.

The building company died a painful and unprofitable death in the housing crash of 2007-present, but the desire to build lived on. Since then I have become a freelance carpenter and specialized in the field of Anything Interesting – kitchens, fancy bathrooms, full remodels, and plenty of projects on my own house and rental houses of the past and present.

Overall, this hobby has contributed somewhere between $200,000 and $400,000 to my current 'stash, between value increases on houses before selling them, higher rental income, free renovations for myself, and getting paid to build things for other people. But far beyond money, it has provided a foundation for self-sufficiency. It is so reassuring to know that even if my house sank into the ground tomorrow morning, I could be out there by lunchtime beginning the enjoyable journey of building it back better than before. In an existing house, if I want a new window or a door somewhere, anywhere, I can just grab the toolbox and start cutting and framing. If I need extra cash (at an hourly rate that is at least four times what I'd get for working at Home Depot), I can just do these things for other people. In any town in the country! Thank you, carpentry, I love you.

Finally, I will reveal my Ace-in-the-hole carpentry moneymaking technique to you. This is the way you can combine a whole spectrum of skills to make a six-figure income while rarely leaving your house and legally paying no income tax. Check it out:

You buy a very dated house in a great and hip neighborhood. The more expensive the 'hood relative to your Dog House, the better. You will be buying the place all the wealthy yuppies are skimming over, because they want something that is "move-in ready".

You move into the house, and start fixing it up. Use your skills, use great design principles from library books and even HGTV shows. Use Craigslist and recycled building materials shops to get the materials at a steal. You take your time and do a good job, and lead a real life on the side. After two years, you finally finish the job.

The house is now worth $230,000 more than you paid for it. You only spent $30,000 on the materials, meaning you earned $200,000 for your work. But because the US government does not charge ANY income tax on capital gains you make on a primary residence if you own it for 2 years or longer (up to a profit limit of $250k), you have just made $100 grand per year with ZERO taxes!

You can repeat this trick every two years for as long as you care to keep making money. If the cost numbers are different in your neighborhood, feel free to adjust them for your own situation, but in most prosperous cities, there is still great profit to be made from renovating your own house with your own hands in the more desirable neighborhoods. And this situation will only improve as the current foreclosure hangover inventory from banks clears out, which is artificially depressing current prices, making now a better starting time than usual to begin such a scheme.

So there you have it – the long-awaited Carpentry article. It may not be for everyone, but for some of us, it can be Everything.

Weekend Edition: the blog so far

By Mr. Money Mustache

Sun, 24 Jul 2011 18:14:00 +0000

Sometime earlier in July, I was perusing the WordPress site stats that prove so addictive to bloggers. I noticed that during my distracted days of lake swimming and cottage building, this blog had hit a nice round number milestone of having had individual articles read a total of 100,000 times. That seemed like quite a lot to me, seeing how triple M was just born in April.

But now, just a couple of weeks later, I see that number is already creeping up towards 200,000 views. Even more significantly, there are now almost two THOUSAND subscribers – people who get the articles directly and thus do not show up in the page view statistics above. Exponential growth, thanks to the magic of the Internet. Just when things start to get slow, another random event seems to happen – this month it was getting a few mentions on the very popular site Lifehacker.com. (Thanks very much to David over there for the mention, by the way).

In June, I experimented with adding some Google Adsense ads to the sidebar. They have been a moderate success. It turns out the bloggers get paid surprisingly little for just having them (i.e., “per thousand impressions”), but surprisingly well when people actually click on them. Unfortunately, a surprisingly small number of people actually click – probably because we are all wise anti-consumers who pride ourselves on NOT noticing or clicking on advertisements. Good for us! I’d have to start a blog on fashion or ‘Celebs’ if I wanted a consumery crowd. According to the terms of service, you’re not allowed to discuss actual dollars per click, but in total, the blog is now earning over TWO DOLLARS per day. That’s far below minimum wage, but it’s still more than enough to pay for our monthly batch of beer brewing.. so thank you, readers!

As for the mental aspect of being a blogger: it is increasingly addictive. I find myself turning more and more into Mr. Money Mustache in real life each day. I buy less stuff than before, not wanting to contradict my own advice.. and I think up dozens more things that need to be said every day. I jot them down in the iPhone's little notepad and only wish I had more time to write. Life is too busy and fun this summer, although with the young lad starting Kindergarten next month, I expect a fantastic amount of new time for hobbies to open up. The comments and readers, i.e., YOU, are the real things that make this fun, since we are an actual virtual community now.

Finally, as search engine traffic has continued to grow, so has the hilarity of the searches that bring people here. Here is a summary of some of the top and/or most interesting ones.

For fun, I've added a few links to the articles that I think generated these search engine hits:

Hypermiling: Expert driving to save 25% on gas.

By Mr. Money Mustache

Tue, 26 Jul 2011 12:06:09 +0000

Actual stats while driving my gigantic 1999 Honda minivan. Over 30MPG over a 336 mile stretch with almost half a tank still left!

Who wants to spend less money on gas? Everyone? Yeah!

Every few weeks, you'll see yet another simplistic article in a bland mass-market publication like USA today or CNN news that says the same things about saving fuel: pump up your tires to manufacturer recommendations, accelerate smoothly, combine errands, and so on. You already follow the tips, and you're wondering if Mr. Money Mustache can offer you more. The answer is of course **yes.**

I've always been pretty interested in maximizing my own car's fuel efficiency. It's a neat little numbers game, seeing how far you can get with each tank of gas, and as a result I have calculated the average MPG of pretty much every tank of gas I've ever bought since my first foray into motor vehicle ownership in 1990 (a 1984 Yamaha DT-125 dirt bike, approx. 45MPG US in mixed terrain of steep mud stunt ramps and cow patties).

But the hobby has really ramped up in recent years along with the increase in gas prices and my discovery of "hypermiling" as an entirely new sub-field in the Online Nerd community. I started reading articles on websites like CleanMPG.com and learned that I was not alone. After a year or two of careful consideration, I decided to up my game by ordering myself an UltraGauge engine monitor for $80*. This is a simple device that reads key data from your car's engine computer and displays it on-screen. I use it to watch instantaneous and average MPG, gallons-per-hour stats, engine temperature, etc, all while experimenting with driving style.

Here's the neat thing about fuel efficiency: it has a big impact on your bottom line, since the average US driver spends two thousand dollars on fuel per year. But contrary to popular wisdom, it has two components: the car itself and THE DRIVER.

The Environmental Protection Agency tests and rates each new car model to figure out its fuel consumption in typical use. The funny part about their rating system is that they have to keep changing it because the average US person drives so inefficiently that they end up using even more fuel than the EPA estimates.

The typical sentiment among drivers is, "Oh, EPA estimates are so optimistic, you'll never get that mileage in real life". Among hypermilers, however, the opposite is true: "Thank goodness I don't get those shitty mileage figures estimated by the EPA, or my gas bill would be ridiculous!".

Case in Point: if I look up EPA estimates for my 2005 Scion xA here: http://www.fueleconomy.gov/feg/findacar.htm, it tells me I will get 27MPG city, 34MPG highway, averaged to 30. In reality, my average is about 44 city, 40 highway, and I've never ever seen anything below 33MPG – a tank used up with a lot of short cold-start trips during a brutally cold winter with snow on the road. Under ideal driving conditions (mild weather, no stop lights and choosing my own speed), the car gets about 52MPG.

Similarly, my 1999 Honda Odyssey construction van is rated at 16 city, 23 highway, averaged to 19, while I have averaged 27MPG in mixed driving, with high of 31MPG across over a thousand miles of 68MPH freeway driving and a low of 22.3 this summer with constant air-conditioning, city traffic, and plenty of hauling of 1500-lb loads of construction materials up the steep dirt road to the cottage.

My own averages correspond to about a 25% savings on fuel – even without any major changes to the vehicles. How do I get these amazing results that make the EPA estimates look utterly pessimistic? While I just consider it “normal non-ridiculous driving”, you could also get nerdy and call it “hypermiling”, and this is how we do it:

1: City driving style.
Most people assume that their car is getting “25MPG or whatever” for the duration of their driving. But the truth is much more exciting than that. When you’re accelerating away from a light, you’re getting about 9MPG and burning fuel at $15 per hour. When you’re coasting, you are getting 60-100 MPG. If you are accelerating half the time, and manage to coast the other half, you’ll still average under 18MPG in this situation. So you need to coast more than half the time.. the opposite of one of my friends who is always either using gas or brake.

When you are idling at a light, you are burning from 60 cents of fuel per hour in a tiny car, to $1.80 per hour in a large one. So while idling is always unpleasant, a much bigger factor in your fuel use is how and when you do your acceleration.

A good guideline to make you think carefully about acceleration is this rhyme I’ve made for you:

“If you have to brake, you’ve made a mistake”.

Obviously this is an exaggeration – other drivers, safety concerns and obeying traffic laws will provide plenty of reasons to hit the brakes.. but still if you *think* braking is bad, you will start planning your acceleration much more carefully. And you'll avoid driving in high-traffic areas in the first place, because you should be biking or doing the car errand later that night when traffic clears.

Overall, you should still use your brakes, but pretend they are hooked up to a speaker on your dashboard which blares out my voice saying "**MEEEEEEEHHHHHHHHHH!!!"** at you for the duration of your brake application – each and every time you touch that pedal. Pleasant, isn't it?

And when you are damned with the chore of driving in traffic, you can still improve things by watching the traffic ahead of you – not just the guy in front, but the next ten cars, and the bikes and pedestrians, and the traffic lights and side streets. "That lady two cars up there keeps looking to her left – she is trying to find an address, leave her extra space. That guy just hopped on his bike and is looking the wrong way.. he will end up crossing in front of me". The benefit of all this hyper-focus is that it also makes you much safer on the road. I never talk on the phone or comb my mustache in the rearview mirror in city traffic – there is much more important work to be done.

2: Highway driving style.
Your car gets its best fuel economy somewhere between 25 and 65 MPH. It varies widely based on engine size and transmission type, but it is safe to say that you are always wasting plenty of gas (at least 15% over peak fuel efficiency) if you get all the way up to 75MPH. Of course, if you are seriously in a rush it may make sense to burn the extra gas (on cross-country roadtrips with multiple people I always go at least this fast, because the extra cost is small compared to the collective benefit of everyone getting there faster). But when you are going 75, you should always have this song playing in your head:
"I am Mister Fancy, I am in a hurry, my time is so valuable that I am wasting gas. Wasting gas, wasting gas, look out world I'm wasting gas. Tomorrow I will save some gas, but today I'm wasting gas". If you do not like my song, you can substitute "Mrs". for "Mister" above, or even write your own and send it in.

At least 50% of your highway fuel is being used to push air out of the way. You can cut your wind load significantly by simply **drafting behind a transport truck.** I find that if I hang back at a very safe distance – two seconds of road space, so that the truck trailer looks about 1.5x bigger than my thumb held at arm's length, my fuel efficiency instantly jumps by 20%. While crossing the country in my van, this trick saves me about $20 of fuel per driving day. You can get bigger savings by drafting closer, but only if you enjoy danger – logically it is not worth risking a crash for an extra $1-$2 per hour of fuel savings. At the safe distance, however, the ride is nice. Truckers are expert drivers and they move consistently and anticipate road conditions well in advance.

3: Engines waste gas when they are cold
When a car first starts, the engine is cold. I found that for the first several minutes, the fuel consumption for light driving is actually **double** what it would be with a warm engine. The idle fuel consumption in my Scion is 0.39 gallons per hour when cold, but only 0.15 GPH when warm. A similar effect occurs during acceleration. So people who use cars incorrectly for bike-compatible errands are effectively paying $8 per gallon for their gas. To avoid this, you simply use your car only for major trips, or at least consolidate errands so the engine stays warm between them. Avoiding constant hot/cold cycles is also part of my secret to keeping cars healthy for 20+ year lifespans.

4: Engines are most efficient under fairly high throttle at low RPMs
Have you ever heard of "Pulse and Glide"? It's a counterintuitive trick used by hypermilers when breaking world efficiency records. They put the car in its highest gear, and accelerate up to highway speed. Then they put the car in neutral (or even turn it off) to coast down to a moderately low speed. Repeating this up/down cycle actually uses less gas than rolling along at an intermediate speed, because the engine is more efficient when working harder for short intervals, than it is working lightly forever.

This is also why cars with less powerful engines tend to have higher fuel efficiency even if all other factors are equal – because the small engine is working in a more efficient part of its power range during typical driving. In real life, you can take advantage of this fact by keeping your car in the highest gear possible for the situation. And always ordering the smallest engine possible – never the V8 or V6 option, since even the smallest and least powerful car in the US is still ridiculously fast.

5: Coasting in neutral saves only a little bit of gas, and only on certain hills.

If you go down a hill and put the car in neutral, you are using only the power needed to idle the engine. Pretty good, since at 60MPH a midsized car will get about 200MPG in this situation.

If you leave your car in gear, and take your foot off the gas at high speed, you are actually using ZERO fuel. This is because the car detects that no fuel is needed to keep the engine running (the wheels are turning it via the transmission) so it cuts off the injectors completely. This saves between 0.15 and 0.5 gallons per hour depending on engine size, which is significant if you do a lot of coasting as I do.

Now, the neutral coaster will end up coasting further and faster than the in-gear coaster, because coasting in gear sucks up lots of energy (which is also known as "engine braking"). So on a long, gentle hill where you need to be in neutral to maintain speed, you save fuel by being in neutral. On a steeper hill like a mountain road where the engine braking is actually useful, you will use less gas being in gear. But overall, we are talking fairly small amounts of fuel of less than $1 per hour of coasting – not worth fretting or risking safety over. I still coast in neutral on remote country roads because it is fun, even in the automatic transmission van, but not in the city or the mountains. In the manual-transmission car, I use neutral much more often in city driving, since going to neutral is instantaneous in a manual. In this case, there are many times you want maximum coasting distance with zero engine braking.

6: When should I turn off my engine?

Always. As noted above, you are wasting $0.60 to $1.80 in fuel per hour of idling, and you save fuel by shutting off the engine for **any event longer than ten seconds.** So, no idling in the parking lot while someone runs into the store, no idling in the drive through (actually, no drive throughs at all, as they are a stupid invention), and if you get stopped for a train or a ridiculously long traffic light, you can even shut off the engine for that. Of course, it's only 3-9 cents of fuel to idle for a three-minute light, and it is surely a bad idea to pull this stunt in front of a police car, but sometimes the joy of just sitting in a silent car wasting zero gas at the longest light in history is worth the effort. Someday, I'll have an electric car or hybrid so this happens automatically.

7: How much does air conditioning really cost to use? What about headlights and other accessories? Thanks to the Ultra Gauge, I was able to test all these things directly while idling for a minute when the engine happened to be at full operating temperature.

In my van, which has a princely dual-zone system designed to cool seven passengers, the A/C boosts the fuel consumption at idle from 0.49 GPH to 0.74 GPH. So it is burning 0.25 GPH, which is $1 per hour at $4 per gallon. When driving 65MPH, this same van normally uses $8 per hour of fuel, so the air conditioning is sapping a surprising 12% of the fuel efficiency – about 3.5 MPG. But it's best to just think of the hourly figure, so you can decide "Is it dollar-an-hour hot in here today, or not?"

In my small car, the figure is only half as much – 0.12 GPH or 50 cents per hour. In moderate weather, the tradeoff speed between opening windows and running the air conditioning is about 50 MPH – use the A/C if traveling faster than that, unless one of your passengers needs access to the roaring air to do cool hand stunts.

Headlights are a much smaller drain – adding only 0.02 GPH (8 cents per hour) to the toll. The radio was even lower, not even registering on the 0.01 GPH-increment scale unless you are rattling the license plate with competition-grade subwoofers and amps at high volume.

8: Vehicle Modifications, small and large
You can reduce your car's rolling resistance, make it lighter, make it more aerodynamic, and make the engine more efficient, in that order of difficulty.

Rolling resistance is caused by the tires. The harder the tires, the lower the rolling resistance. Automakers specify a fairly low pressure, like 30 PSI, to balance fuel economy with the mushy ride most US drivers expect, but I find that you get a firmer ride with sharper handling and higher efficiency by using the maximum pressure specified on the sidewall of the tires itself – I use 40 PSI, close to the 44PSI rating of my current tires. This change yields about a 2% increase in fuel efficiency. Next time you replace your tires, you can also select “low rolling resistance” models that add 2% or more to a regular tire’s performance as well.

In a 3,000 pound car, each 30 pounds you slice from the weight cuts your weight by 1% and increases your fuel efficiency by about the same amount. It also improves acceleration and handling. I always start by removing the spare tire, jack, and related metal accessories from the trunk. There’s 50 pounds, and a bunch more trunk space. I do add in a can of fix-a-flat tire repair spray. Spare tires are good if you’re traveling alone through Death Valley or South America, but for local errands, in a world with cell phones and internet access, I haven’t worried one bit about my own habit of never carrying spares for the past 20 years (I have had a few flat tires over the years, but always just slow leaks that I discovered in my driveway – an embedded nail or similar).

Taking out unneeded seats in a van, trailer hitches or other cargo is also useful for a small boost. A full tank of gas at 8 pounds per gallon usually weighs over a hundred pounds too. Because of this, and because a full tank of gas lasts several months in my van (raising concerns about spoilage), I usually buy only a quarter or half a tank unless I’m heading out on a road trip.

Aerodynamics are hard to change for the casual fuel-saver. **You should definitely keep all roof racks off of your car except when actually using them on a trip – a typical rack wastes over $100 per year of fuel**, but other than that there are not many easy ones to do.

Enthusiasts, however, buy sheets of Coroplast plastic and attach them firmly to the underbelly of the car and over the rear wheel wells. These two things can significantly improve highway efficiency, although I have not had the motivation to go this far myself. Hypermilers also block at least part of the intake grille on the front of the car, which I have done. This improves aerodynamics and lets the engine run warmer – which sounds bad but is actually good in most cases if you read up on it. As a final trick, I sometimes flip in one or both of my external rearview mirrors when driving extremely long distances in extremely remote areas (for example crossing Wyoming at night). I can still see outside just fine with the internal rearview and my usual shoulder checks for lane changing. At high speeds, this saves a surprising amount of fuel – 2%.

The Final Factors: Minimal Driving and Vehicle choice:

The tips above will help an EPA-level driver slice their fuel costs by 25% without replacing their car or changing their driving habits. But of course we will go much further than that, since my own goal for you is to have transportation costs at least 75% below normal. To get to that level, you need to use a reasonable car and drive less, being sure to live within 10 miles of work, and bike or walk there most of the time. These are the most important factors, but they are rarely mentioned in newspaper and magazine guides, because the publishers don't want to offend anyone (or may not even realize themselves that lifestyle change is possible).

For anything other than massive family roadtrips or heavy load hauling, you should be driving a lightweight 4-cylinder vehicle with manual transmission. EPA rating of 25 or better in the city, 32 or better on the highway. If not, you've used excusitis to incorrectly justify getting yourself the wrong car. This may sound tough to you now, but as your frugality muscles become stronger it will become an easy choice.

There are several hypermilers among the readers who are much more badass than me at the sport. We will probably hear from them in the comments. Hopefully their tricks and mine above will save all of you many gallons in the years to come, until we all finally switch to electric cars!

** Shame on the Ultragauge company: Don't be fooled by the misleading $59.95 price sticker. This device costs $80. (it is $69.95 plus about $10 of shipping, and there is a super-inconvenient mail-in rebate that actually requires you to do a test to get the refund. Even I didn't bother to mail it in, as the time required worked out to a very low hourly return on the effort.) This is misleading, and the company deserves to suffer for it. But even thought the Ultragauge has a very crude and unpolished interface, and is expensive for something simpler than a wristwatch, it is still better and less costly than the ultra-pricey ScanGauge.*

A Millionaire is Made Ten Bucks at a Time

By Mr. Money Mustache

Mon, 01 Aug 2011 12:47:00 +0000

I was at a party recently and a lifelong friend walked up to start a conversation. Although we had never talked about money before, it turned out he had secretly been reading this blog, and now he had a few questions for me.

"I understand now that even a family can retire on well under a million dollars*, but that is still a lot of money. Yet your blog talks mostly about small things like saving $70 a month on electricity or gasoline or coffee.

Aren't these two different universes of savings that don't even relate?"

–

My friend had a good question, of course. It is this perception of "small" versus "large" amounts of money that is the downfall of most of us.

It drives many to fantasize about lottery winnings, since that's the only way to become a millionaire if your job title doesn't include CEO, NFL or Notorious B.I.G., right?

And meanwhile, we buy $9.75 bottles of Kirin at the sushi restaurant and $12.00 movie tickets to see the newest Pixar movie with the kids in the movie theatre and pour $70.00 of gasoline into the family SUV so we can burn it up every couple of weeks running around town for relatively short trips. And we don't become millionaires very quickly at all.

The solution to this is a change of mindset: It's time to start getting excited about ten bucks again.

When I was eleven years old, I had to cut my parents' enormous and hilly half acre lawn by pushing a fume-spewing 21-inch Lawn Boy for two hours. For this afternoon of sweaty torture, I would earn **five bucks.**

Then I would excitedly wait a week so the grass would grow and I could repeat this process to earn another five bucks. At this point, I would have ten bucks.

Sure, that was a long time ago. But even today, ten dollars will still buy about 9 pounds of delicious, kickass, nutritious, muscle-fueling rolled oats – still a solid staple food for many healthy millionaires, despite the fact that we can easily afford. Or two gallons of organic milk. Or enough gasoline to drive over 200 miles in a good car. WEEKS worth of regular driving if you don't have a ridiculous commute. Or enough natural gas to provide hot water for showers and dishwashing for a family for several weeks.

Ten Bucks is a lot of money. So you need to respect it.

Ten dollar bills are not just food stamps or amusement park coupons that you fork over by the dozen to get restaurant meals, smokes, strippers, drinks, tourist attraction admission, and assorted domestic services. Each Ten is **a critical brick in the Early Retirement castle** you are building.

So how can we get from ten dollar bills to six-figure sums required for early retirement? Think of it this way:

If you could ***somehow*** $796 per week, and each week invest it to get a rather typical 7% compounded investment return after inflation, after just ten years, you'll have about $600,000 sitting in your account. And to be more accurate, this money won't be just sitting around – it will be **600,000 little employees working for you** tirelessly in the background, producing thousands of dollars per month of passive income.

As you can see in the footnote section below, that is more than enough to start a nice Early Retirement, especially if your house is paid off. Maybe more than twice as much as you need, but since we do conservative calculations here at MMM, let's roll with that number.

"But how the hell can anybody save almost $800 per week!?"

Suppose you've got two income earners working together. Now each one has to save only $398 a week.

There are 112 waking hours in each week. So to go from "broke" to "rich enough to retire early" in just ten years, each person has to make 40 successful ten dollar decisions each week.

Some of these decisions can be made automatically – like owning a less expensive car and driving it less ($100 per week per person), using less electricity and other utilities ($25), eating most office meals without going out to lunch ($50), not having cable TV and in general spending less time in retail establishments ($25). Now the remaining number is only $200 a week.

Most zero-savings people blow dramatically more than $200 a week just on random purchases. Spas, yoga, fingernail treatments, bottles of wine, sixpacks of beer, shoes, electronic gadgets, ice cream cones, movie tickets, plastic crappy toys for toddler birthday parties, books from Amazon.com instead of your local library, lawn-care services… whatever.

Those, combined with the automatic savings above, are the ten-dollar decisions that make the difference between the typical broke and indebted person, and the Mustachian Early Retiree.

If you start Respecting your Tens at age 20, you'll be Retired by 30.**

Now, before the whiners start chiming in and saying it is no fun to spend zero money, you must realize that there is plenty of wiggle room for luxuries in my numbers.

Each person is saving $400 per week or about $20k per year on top of their house payments. Yet many of us have a take-home pay of *over* $30,000 per year. Sometimes *way* over that amount.

There is plenty of money to go around in this situation, and I'm even giving you a single family home to live in and a relatively quick 10-year sprint to retirement! If you have any issues with my numbers, make your own adjustments and the results will still be amazing.

But even with all this room for indulgence, it is important to keep your priorities in order, otherwise you are combining Luxury with Fantasy.

For example, it is absolutely ridiculous to buy even your first bottle of wine or restaurant meal if you do not yet have a good bicycle and a bike trailer. It is insane to buy a luxury car if your house isn't even paid off yet. If you still have student loans, get them paid off BEFORE you splurge on that iPhone or overseas vacation.

You can still have these frivolous and fancypants things, some of which I admit to owning myself. But you need to have a rational definition of *"Can I afford it?"*

Part of the Ten Dollar Philosophy is that you must pay for the current luxuries in your life before you start adding additional *luxuries*. (Can you tell I love that word)?

I'd also suggest that since luxury spending is primarily for pleasure, you could try doing much of your purchasing for *other people*. Perhaps counterintuitively, it is proven that most of us get more pleasure buying a necessity that really helps someone else – for example, a bike for a family member who can't afford one – compared to yet another luxury for ourselves – a $100 hairstyle or an upgraded china set for our yacht's main dining room.

So there you have it – the way to become a Retired Millionaire using just those useless paper scraps in your wallet – by changing the way you think about them.

** A family of four in the US can live comfortably on about 24k per year plus having a paid-off house. With an nice conservative 4% annual withdrawal/return rate on your investments, you need $600k invested to generate this cashflow, inflation-adjusted, forever, plus your $200k house. $800k total. Or, if you want to get off your butt and work very occasionally to earn $12k per year, you can slice the $600k number down to $300k! Or you* *can save the $600k AND work, and keep saving more and more over the years – ending up a multimillionaire all while doing very little paid work.*

*** Holy shit, that's quite a neat little verse I came up with there! Believe it or not, it happened completely by accident.*

Mrs. Money Mustache Receives Many Gifts for Her Birthday

By Mr. Money Mustache

Wed, 03 Aug 2011 12:19:10 +0000

Eliminating Lady Temptations: Step 2 (see Step 1)
by *Mrs. Money Mustache*

I recently celebrated my birthday. I turned 37. The day started off lying in bed with my little boy, who turned his sweet face to me and gave me a morning hug and kiss and then wished me a happy birthday. Perfect already. Shortly thereafter, I received a call from my brother who sweetly reminded me that I am now officially in my late 30s. Luckily, I've always loved birthdays and turning one year older. I feel young, healthy, and happier than ever. I know myself better, I feel a little bit wiser (mostly thanks to my gray hairs), and I'm learning what's really important in life. In the MMM family, we celebrate birthdays for at least a week, because well… why not? Of course, the celebrating isn't full of unwrapping and surprises, as is typical of many birthdays. It's about a lot more.

Over the years, I've heard many women complain that their spouse forgot their birthday or they didn't receive the special necklace or diamond encrusted love ring that they were hoping for. "Where's my $150 dinner at the fancy restaurant and my day at the spa… How could my sweetheart forget my Birthday Gift!?"

Stop doing this, ladies! First of all, if you're married or in a committed relationship, your financial futures are joined – so he's spending YOUR money on the gift anyway. Second, a gift doesn't mean much if you have to ask for it. Third, channel your Inner Lioness and give yourself the POWER to make your own birthday or holiday plans. Why rely on someone else for your happiness?

Mother's Day Garden Project began, as well as my annual birthday haircut. Even the Mister decides he deserves a birthday gift from time to time.

Being married to MMM means that the gifts are different, but they are actually much, much better. Over the last 17 years I've received: a big handmade wooden heart with a poem on the back, a Rock Shox suspension seat post for my mountain bike, handwritten letters and notes, a latte every single morning for the last 5+ years, equally shared parenting, garden boxes, various renovation projects done to my specifications, incredibly funny e-mails, a hike to the spot we were married every year on our wedding anniversary, and candlelit dinners (and even breakfasts!) every single day.

This year, the gifts were plentiful once again:

– waking up next to my sweet little boy's sleeping face
– listening to my child's awesome story of his dream within a dream
– a delicious morning cup of coffee and run (I mean an actual run, as in running) to the store to get milk just for me from MMM
– an amazing birthday breakfast from my mom (asparagus was involved)

– talking to my brother on the phone
– a luxury morning shower
– a cool after-rain walk with MMM to get my gluten-free birthday cake mix
– listening to my mom and son secretly making me a birthday cake
– a handmade birthday book and several cards from Little MM
– spending quality time at my parents' beautiful cottage with family that we hardly ever get to see
– laying tile and chatting side by side with MMM, while Little MM enjoyed a paddleboat ride with his grandparents
– an impromptu birthday song mid-day
– looking though my baby photo albums with my dad
– sore muscles from my hardcore workout at Crossfit O-Town's free Saturday morning class

It couldn't have been any better. So, if you're expecting a birthday this year, make a list of what you'd like to do. It could be a walk with the family, a trip to the library, time to write a list of goals, a hike with a friend, a dinner with cake at home, or a day all alone. Start a birthday tradition. Bake your birthday cake with your kids. Do something that has meaning for you but doesn't cost anything. Or, if you're feeling competitive, try a birthday challenge and get a group of friends or your family to partake. At a recent extended family dinner, we discussed some great physical challenges for past and upcoming birthdays. Excellent idea!

What do you want for your birthday?

Making Money while Taking Vacations

By Mr. Money Mustache

Fri, 05 Aug 2011 12:47:26 +0000

Well, we're home.

As you may or may not have been aware, the Triple M family has been on the road since way back in June. We had a blast. Everyone is sun-kissed and skinny from being outside playing so much all summer.

But aside from these obvious benefits, I got another surprise when we returned from this six-week trip: a healthy pillow of cash had built up in the bank account while we were away not working. Usually people have to save up to TAKE a vacation.. they don't save up while TAKING a vacation. How did this happen?

As it turns out, it was just the usual combination of thinking about things in a new way, to shift the balance of life away from spending and towards earning.

The first factor was **renting out my own house**. When you own a house and you go away on a long trip, you've got a huge asset sitting there not being enjoyed by anyone. As my own trips grew longer after retirement, I started wondering if it would be practical to rent the house out to a trusted person or family so they could pay me for being away.

It turns out it WAS practical! If you know enough people, and combine it with a little social networking or even Craigslist searching, you may be able to find a fantastic tenant to take care of your house for you, and pay you handsomely for the privilege. In our case, another family we met through our son's preschool lives abroad most of the year, but spends every July in the US. Our house is a good candidate for a short-term rental – fancy yet relatively uncluttered since I like doing renovations but not buying objects. So it was easy to sweep away embarrassing personal belongings and hide them in the basement and have the place looking like a classy hotel for our tenants. **Net Income: $2000.**

The next factor was **finding affordable transportation**. Since we live almost 1800 miles from our extended family, it is a hell of a drive. But the wife and son bypassed the driving by picking up a good sale on one-way flights to Canada. On departure day, I dropped them off at the airport, then continued East in order to drive myself separately (normally I would fly a distance like that, but for a long trip and with the requirement of bringing a vanload of tools, I found it more practical to drive). I camped out in the van for the first night (Iowa), and visited a friend the second night (Chicago). After that I reached Canada. So all accommodations were free. Including plane tickets, gas, and an allowance for wear on my older, self-maintained vehicle, we'll say **Net Travel Cost: $1000.**

Once in Canada, I did the rounds of visiting but also helped various people out with construction projects. Because I enjoy the work, I ended up doing several thousand dollars of carpentry work on a cottage for free. The inlaws were so grateful, they gave us all food, drink, and even paid for the gas required to drive the tools to Canada and back. **Net benefit of food, drink, and gas: $1000**

Since we were so busy doing family-oriented things, we found we did not have to buy anything at all on this trip. No Disneyland tickets, no shot glasses, no high-heeled shoes. The things we brought in our backpacks were all we needed. But we did still make one decadent purchase: a $100 sushi meal with good friends in downtown Ottawa, where everything is rather expensive. **Net discretionary expenditures during entire trip: $100**

On the way home, the whole MMM family drove together, taking several days to do it and staying with family except the last two nights (note to self: need to make friends in Iowa and Nebraska to round out future trips). We got a little crazy and got pricey hotels both nights for a total of $250. **Net travel-home cost: $250**

So the vacation looked like this:
Income: $2000+$1000 = $3000
Expenditures: $1000+100+250 = $1350
Net Profit: $1650.
And meanwhile, while we were off spending nothing and enjoying life, the July and August rent checks rolled in from the rental house, adding another $4800. With no mortgage and virtually no credit card bill this month, all of these new employees get to stay. What a great vacation!

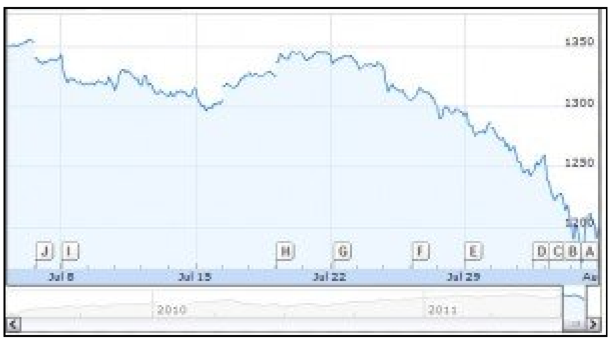
My point in all of this is not really to describe details of my own vacation, but rather to illustrate the mindset that can help any Aspiring Mustachian or Early Retiree get further in their own recreational plans. Although the vacation industry tries to encourage us to spend as much as possible, experiencing a new place actually does not have to be expensive at all. If you look at each step of the trip and figure out how to maximize the fun and cut out unnecessary costs, you too can probably travel virtually for free. And if you are taking a longer trip, I would definitely recommend using your home or apartment as an income booster for the duration.

What were your most frugal vs. most expensive vacations so far? Does the level of fun correlate with the level of spending, or is it actually an inverted relationship sometimes?

Summer Clearance Sale on US Stocks!

By Mr. Money Mustache

Sun, 07 Aug 2011 12:07:29 +0000



Stock market watchers like myself have had an entertaining couple of weeks recently. Amid lots of dramatic economic and political news, the S&P 500 index has dropped from a July level of 1356 down to 1199 (as of Friday August 5th). This 157-point drop works out to almost 12 percent of the value of the index.

In other words, in just two weeks, the market value of the 500 largest companies has dropped by about $1,260,000,000,000.00 (1.26 TRILLION dollars). All this happened without any change to the *earnings* of the companies – it's all due to the random speculations of market traders ("we don't like the new budget deal! that debt crisis stuff in Europe is scary! hey, stocks are going down, let's sell them because they are going down!")

For those of us index investors who don't care about short-term factors, and who know that in the long run, buying at a low price-to-earnings ratio is the only real way to increase your odds of higher long-term returns, this means stocks are 12% more attractive this week than they were on July 22nd. If you think of the stock market as a machine that hopefully delivers 9-10% annual returns to you before inflation, this is like getting an extra 1.2 YEARS of investment gains added to your return.

So is it a good time to invest?

In an earlier article called "How to tell when the Stock Market is on Sale", I suggested that stocks in an S&P index fund start to become a good deal when the price-to-earnings ratio is below 16.4, the long-term average for US stocks if you start your counting at the year 1881. (Note that this is the conservative way to measure, since the average P/E ratio since 1950 is more like 18.6, and some market optimists start their own counting in the 1970s or even 1990s).

When I wrote that article, the S&P500 index was at 1280, and the total company earnings for the most recent year were $78.86, giving a ratio of 16.23 – right around the average.

Now the index is 1199, and the earnings have grown to $82.13. Because despite what you read in the complainy news headlines, the US economy is quite healthy overall and many companies are raking in record profits. **The new P/E ratio is therefore 14.6!**

More conservative investors like Robert Shiller, author of *Irrational Exuberance* will tell you that looking at just the current year's P/E ratio is naive – you should look at a ten year rolling average of earnings to see how the stocks are really doing. In that case, even with the sale, we are still at a ratio of 20.7. This method would tell you stocks are still expensive – 26% overvalued. On the other hand, while they are higher than the historical average since 1881, stocks are still cheaper than they have been for the last 18 years or so (except for a couple of months right around the Great Financial Crisis of 2008).

So, I'll leave it up to you to make your own investment decisions. But for my part, I'm currently re-buying the shares I sold off earlier this year to kill off the mortgage, at a 12% discount. And I'll continue to add to the stash over time if the panic and reduced share prices persist. To make money in stocks you must buy low, benefit from a reasonable dividend yield, and hopefully eventually sell high as well. This feat is made much easier if you can manage to buy during periods of great turmoil and scary news headlines – i.e., when stocks are on sale.

Update! *I wrote that on the weekend in case people wanted to start thinking about picking up some stocks this week. Then on Monday the S&P Index dropped another 6.66%. So the total discount is more like 18% now. Apparently this is one of the top 20 drops of all time (you need to get to the 2008 level of over 40% to get into the top ten, since the 1900-1949 period was loaded with megacrashes).*

I clicked 'buy' on Monday afternoon with all of the spare vacation earnings in my bank account. Perhaps I'll go out and earn some money this week so I can buy more shares if the rout continues.

Reader Case Study: Is this 26-year-old Ready to Retire?

By Mr. Money Mustache

Tue, 09 Aug 2011 12:52:51 +0000

 Mr. Money Mustache recently received a request from an up-and-coming Future Early Retiree. His name is Mike, and at the time of writing he wrote a blog called "Mortgage Free by 30". Here's what he had to say:

> *"Basically, I hate my job. The company is great. The job isn't. I want to work for myself.*
> *After reading your blog, it has made me wonder if there is a possibility of "retiring" in the near future. And by retiring, I mean working part-time. If you'd be up for it, I would be willing to send you all of my specific numbers to see what I need to do to be like you."*

First of all, I must say this sounds like a very ambitious young man with wisdom far beyond his years. Being like Mr. Money Mustache? There's a goal I approve of.

Mike is pretty new to the world of high-income professional employment, and the associated high savings rate that comes with it if you don't become a typical martini-swilling car-financing Ultraconsumer. But he's already got some big dreams – paying off his mortgage before age 30 (March 2015), quitting his real job, and moving to a creative and unbounded life of freelancing and other random ways to earn and save.

Here are some vital stats to get us started:
Annual Income: $70k
Annual employer 401K match: $4900
Total Income: $74,900
Income taxes, SS, Medicare deductions: $13,000
Total Annual Spending: = $18310 (further details at the bottom of this article for voyeurs)
Total annual savings is therefore $74900 – 15,000 taxes – $18,310 living expenses = **$43,590**.

This annual chunk of savings gets distributed roughly like this:
401K including employer match: $9100
IRA contributions: $2400
Mortgage principal payments: $32,090 (the man is really jonesing to be mortgage-free).

That covers the income/expenses side, now let's review the 'Stash to see how it is looking:
Home Value: $120,000
Remaining Mortgage Balance: $74,000
401K balance: $9,000
Roth IRA balance: $11,000
Other assets: owns a 2010 Honda Civic with no loan

So what's the plan for Mike?

The key to financial success for any person is having expenses lower than income. He's got it, with living expenses of $18k per year. These expenses currently include $2775 of mortgage interest, which will drop to zero as he gets his mortgage paid off. But once he quits the cushy job, he will want to replace his current employer-paid health insurance with a self-paid policy. At a good outlet like ehealthinsurance.com, this will cost him a similar amount to what he now spends on the mortgage interest.

The first option is quitting the job immediately and dropping down to a $40k freelance income. Can he afford it? **YES**.. but it will definitely slow down his mortgage payoff plans. For simplicity, let's suppose his after-tax income will now be $34,000. If living expenses stay the same at $18k, he will have 16,400 to save each year. If he distributes half of this to long-term savings like an IRA, and the other half to the mortgage, he'll take about **eight years** to pay off the mortgage. Even if he goes crazy and devotes all 16,400 to the mortgage, he will take four years or so. Mike might not become **mortgage free by 30** with this program, and thus he would lose his prestigious blogger identity! But he'd probably have a lot of fun in the process.

The second option is keeping the Dilbert-quality job just until the mortgage is paid off. At the current payoff rate of $32k per year, that will be done in just two years. He'll be 28 years old, and he will also have another $23,000 or so packed into retirement accounts from his 401k/IRA contributions and the employer match. Plus he will save a few thousand in health insurance premiums.

In the end, either option will work. It all depends how adventurous you feel versus how much you want some financial security. I've always been a bit on the conservative side myself – which is why I saved up a lifestyle-sustaining 'stash before quitting my job, even though I don't really need it since my lifestyle is cheap enough to sustain on just part-time work. I could have jumped into this lifestyle as early as age 21, but then I wouldn't be *Mr. Money Mustache*, just *Mr. Simple Living Sideburns* or something.

The other issue is his longer-term savings plans. If he keeps the big corporate job and the frugal lifestyle, his wealth will exponentially rise into the realm of the Rather Rich. The mortgage will be gone in 2 years, and the 46k+ being saved per year, plus a growing amount of compounding gains and possibly even salary raises would place him solidly into the Millionaires Club sometime in his 30s.

At some point you have to decide how much is Enough. If you have plans to eventually own a bigger house, or raise some kids, you might find it convenient to stick to the high salary for a couple of extra years. Even if the job sucks on paper, you can teach yourself to enjoy it more if you know you are just around the corner from lifetime freedom. If you already had $300k or more in retirement savings, I would be suggesting you bail quickly. But since your Money Mustache is still just stubble at this point, it is wise to consider the fact that a short day at the office may pay as well as two long days of freelancing.

An Extreme Mortgage Payoff discussion would not be complete without considering the tradeoffs. Mike's investment in extra mortgage payments amounts to a fixed income stream with a guaranteed 3.75% annual return, since that is his mortgage rate. It's not too shabby – better than a checking or money market account.. but he could also easily get a smooth 6-7% dividend cashflow just by picking out some nice REIT funds – the topic of another article coming up later this week. The REITs have a bit more risk associated with them, but the higher return is usually worth it to people with decades of investing in front of them.

However, with the entire house tying up only $120k in this case, it's not a big factor in his long-term wealth. In fact, I must again make fun of myself for owning a much more expensive house. It is costing me a lot of money (in the form of foregone investment returns), so the house must continue to deliver a very pleasurable lifestyle to the MMM family to earn its keep. In the long run when the young lad grows up, we'll probably sell it and downsize.

To round out the case study, here are a few more details on the expenses as he sent them to me, in case you want to compare them to your own situation. As you'd expect, I have added a few MMM comments of my own to his numbers.

————————-

Expenses:

Monthly
Mortgage $625
Condo fees $375 (Temporarily higher, but for the next couple years. Normal is $250-ish)
Electricity $40 – $60

Groceries $150 – $200
Gas $100
Laundry $20
Internet $40
Dog $30 – $40
IRA $200
Restaurants $100
Gym $30 <-*MMM: perhaps I can help you here*.
Hair $20 <-*MMM: And Here*.
Gifts $25
“Other” $100 – $150
** I have no cable TV bill or cell phone bill. I have a cell phone, but I am part of a family talk plan and the policy is not in my name.
Semi-annually
Auto Insurance $440 every 6 months <-*MMM: Driving around in a 2010 car is luxurious, but I'd definitely advise trading down if you can handle it, especially once you are done the job and thus not driving around as much. My own car insurance is less than $160 per 6 months because I do low annual miles and don't need collision/comprehensive insurance. County taxes are much lower on older cars as well. And it's still pretty new by my standards – a 2005.*
Dog shots/meds $75 every 6 months

Annually
Property taxes $800 – $1,000
Homeowners Insurance $185
Car tax = $250
Some other details for you:My mortgage balance is $73,999, due to my prepayments.   I have some equity in the home. Value is $120,000.
I have a paid off a 2010 Civic. If I went freelance, I might ditch it. I live in a city, but due to my overnight hours, I felt the need to get a car. I won't work overnights if I freelance.
Roth IRA balance is 11K. This serves as my emergency fund as well.
401K balance is 9K
Total investments 21K
Checking accounts keep low balances intentionally, but I usually have 1K or so for emergencies.

What do you think? Early Retirement or Stick it out and Slave for a few more years?

Get Rich With.. Craigslist

By Mr. Money Mustache

Thu, 11 Aug 2011 12:02:30 +0000

 bicycle as one of the Top Two Things that will Save America From Itself, that it deserves its own love note.

Let's illustrate with a little story.

Early this afternoon, I was enjoying some manly hobby time, fiddling with tools out in the shed. Then a piece of wood fell over and bonked me in the shin. I picked up the wood, only to snag it on a fluffy bag of insulation poking out into the room. I tried to stuff this back into place, but the shelf was already overflowing with scraps of wood and other construction materials. "God Dammit!", I said, "My shed is way too crowded!".

The root of all this evil was a pair of Papasan chairs that were also hanging out in there, taking up half of the floor space. They were surplus furniture – one from the good ol' days in my first house, circa 2000 , and another left behind a few tenant turnovers ago in the rental house. Both in good shape and fairly stylish and modern, but just with no reasonable place to fit in our current house.

In the bad old days, you'd have four choices for bulky troublemakers like these:

1. Leave them in your garage or basement, forever cluttering up your life and let your children sort them out in your estate sale when you die.
2. Plan to hold a garage/yard sale someday to sell them off.
3. Pay an exorbitant fee to list them in the local newspaper classified in hope of selling them.
4. Throw them out.

Note that options 1 through 3 usually turn out to be equivalent – you are unsuccessful in unloading the items so they stick around and burden you until your death.

But here's what I did today instead:

1. Heaved them onto a reasonably clean section of my driveway with some trees in the background.
2. Whipped out the iPhone and snapped a few pictures – an overall shot plus a few closeups, with cushions on and off.
3. Ran the Craigspro app on the phone to log into Boulder Craigslist, type a description, upload the photos and click "Post". (I priced the chairs at $25 each, in case you were wondering).
4. Received a text message on said phone approximately ten minutes later. "Your chairs still available? Can I pick them up tonight?", "Yup, here's my address, see you at 5:00!".
5. 90 minutes later, helped the young lady who had just moved from Chicago to Boulder (a very wise move in my opinion) load them into her pickup, with a fresh fifty dollars rustling cheerfully in my pocket.

Shed cleared, 'Stash enhanced. What a fantastic invention Craigslist is. And the more popular it becomes, the more useful it becomes, since the market grows. It is the type of service I feel we need to save the world – completely non-corporate, non-greedy, and community organized. Craigslist does everything for free except for a very small subset of categories of postings (such as employment ads placed by companies in NYC). This small stream of income is enough to pay their tiny staff and run the service around the whole world.

And what a service they are providing. Even though it is very simple, it enables countless millions of people to buy and sell products and services, free from advertising and commission fees. And most significantly to me, to get almost anything you need, used, and sell anything you don't need for a fair price as well.

The value of used goods is a funny thing. A high-quality front-loading washing machine and dryer set costs about $1200 new these days at a store. On Craigslist, you'll pay $400-$500 for a very similar set that is just a few years old. The person you bought them from lost $700 on the transaction. But if you buy carefully and keep them good shape, you can use these appliances for a few more years and re-sell them for virtually the same amount if you need to move on or upgrade. The used-to-used depreciation is even less on longer-lasting things like furniture or garden tools.

This brings up a neat possibility – not only should you use Craigslist instead of a retail store to buy every manufactured thing you need. You can also use it as a free way to "store" your unused goods. I didn't hesitate to sell my papasan chairs today, because I know if I ever need them back, I can open up Craigslist and find plenty more just like them at any point in the future.

I feel the same way about the 2001 Honda VFR800 motorcycle I "stored" on Craig's a few years ago. She was my baby when I foolishly bought her new in 2001, but I just wasn't finding many chances to ride by the year 2007, having no job to commute to and a young child to care for. I was hesitant to sell the bike, until I realized I was really just storing it and letting someone else pay for the continuing depreciation. There will always be an infinite number of motorcycles streaming by on Craigslist and if you need one, you just reach your hand into the stream and scoop one out.

Over the years, I've probably done a couple hundred thousand dollars of deals on Craigslist, including finding about fifteen sets of rental house tenants, selling a car and a motorcycle, buying a different car and a minivan, plus an untold number of furniture and tool transactions. One time I really liked a person who came and picked up some free chairs from me – we are still friends today. Another time I wanted to learn how to re-roof my own house, so I posted an ad asking for an experienced roofer to come work alongside me to teach me how to do it. I got a reply the same day and hired the guy – That roof came out great, saved me $3000 over a roofing company, and I'm still friends with that roofer as well. Later he gave me a kiddie pool for my son and helped out on several other construction jobs in my circle of friends as well as offering work to me.

So I view Craigslist not just as an Environment Saver – by preventing the unnecessary manufacturing of a bunch of new stuff – but also a Community Machine – connecting millions of people to do real activities together, as opposed to the soul sucking model of big corporations stamping out stores across the world, staffing them with minimum wage workers, connecting them to a stream of wasteful products flowing straight from China, and having us all drive into the big boxes every day to bring home SUV-loads of it which will soon end up buried in a landfill.

But even I am just a casual Craiglist user compared to some. You can also use it to find a job, a lover, or even to make money as a reseller. Some people with an eye for value and a mouse finger built for speed search each day, finding undervalued or free items, scooping them up, and then re-selling them at higher prices on Craigslist or ebay. Arbiters in the world of used goods.

But since it's not retail, there is actually some skill involved in being a truly successful Craigslist participant. You will do much better if you do your buying with real manners and your selling with real marketing. For this reason, we will conclude the article with

Mr. Money Mustache's Guide to Great Craigslist Success

Selling:
Always take the time to properly stage and photograph whatever you're selling. Clean it up, put it in front of a nice background, position the camera in a useful and dramatic way, and make sure the damned flash is off. Take ten photos, and post the best four (or whatever the maximum allowed is) on your Craig's posting.

For rental houses, link to an external website with at least 20 pro-quality photos, every room from every angle at a minimum. This technique alone lets me charge at least 10% more for my rentals than similar-quality homes with crappy Craigslist ads!

Use loads of descriptive text, including full specifications, measurements, emotional descriptions of the benefits of owning this item, and include the price it cost new, to illustrate how cheap your asking price is by comparison.

Have a catchy headline that includes the brand name and something like “high-quality”, “Fancy”, or “luxurious” in it. Silly old advertising words still work well, since they have a nice vintage feel to them, as if being spoken by a 1950s man with styled greasy hair.

Buying:
Respond quickly, with a polite and intelligent inquiry by email. Not, “U still hav ur speakrs?”, but rather, “Hi, I saw your ad from Tuesday on Craigslist for the Polk Audio speakers – I’m right near you in Longmont, are you around this weekend for me to check them out?”

Once you have contact, make your offer in advance by email or phone, “I’d be interested in those speakers if you can let them go for $200. I understand that you might want to hold out for a better price, but email me back in the future if you decide this will work for you”. Once you are at the person’s house, your position is weakened since they know you drove there probably willing to pay the full price.

Overall:
Just like the real world, Craigslist is full of both wonderful and useless people, so you can hone your interpersonal skills by seeking out the former and learning not to waste time on the latter. But in general, I feel that the more of your business you can do locally on a person-to-person basis, the better off you’ll be in life.

Thank you Craig Newmark!

Current Events In Stupidland

By Mr. Money Mustache

Fri, 12 Aug 2011 12:00:52 +0000

It seems that Mr. Money Mustache attracts quite a few of the already converted. Every week I write out more of the biggest and most amazing secrets that have allowed me to hop effortlessly across the minefield of American Middle Class life and become rich at an early age. And you, the Mustachians, usually chime in saying "Yeah, Mr. Money Mustache, that's some good shit, and I'm already doing it. Thanks for entertaining me by reminding me how smart I am."

From reading the comments, you'd assume that the world is already fixed and it is time for ol' Triple M to retire from blogging and find something else to do.

Until you step out of the air-conditioned comfort of this blog and the heat wave of the real world hits you in the face again.

Take, for example, this mainstream newspaper article that has been making the rounds in social media today:

Financial Insecurity: Most Americans Can't Afford Unexpected $1,000 Payment, Survey Finds

The article tells us that most people in the US could not handle a $1000 emergency. Not only is their monthly budget tight enough that there isn't $1000 of savings each month, which I would already find quite scary, but there isn't even $1000 ANYWHERE in their lives to scrape together.

That could be explained if we were actually in a place with a shortage of money, or if the survey covered only people in a certain category, like the long-term unemployed. But no, this was a *random* survey, meaning *average people*, meaning an *average income over $30,000*.

The last time I had less than $1000 available was in April 1990. That's because I had just started my first job working at the local gas station in March, and my $4.15 per hour wage only added up to about $120 per week since I was also attending high school full-time. Thus, it took me about eight weeks to get up to a thousand bucks.*

The reason I never dropped below $1000 is because **YOU DON'T GO OUT AND BUY SHIT WHEN YOU HAVE LESS THAN A THOUSAND BUCKS!! NOTHING AT ALL!! IT'S AN EMERGENCY!!!!**

At this level, you're not allowed to buy yourself cigarettes, or any food other than bread, peanut butter, bananas and tap water.

You need to sell your car, and bike or walk to work, regardless of distance. You can't have a cell phone, you can't go to Target, you can't drink a can of Coors Light, and you can't even buy your kid a $2.00 toy.

These are all things that can wait until you have more than a thousand goddamn dollars, which you will very quickly if you are an Average Income American and you stop spending money even for one week. Then you continue saving most of your money until you are financially independent. If something insane happens and you ever drop below one grand, you go back to the start of this section and repeat.

But even that is not the scary part. The scary part is in the whiny complaint-laden comments made by readers after the article. Like this one:

"Is this a surprise to most people? Are Americans living in fantasy land? Americans are getting poorer andpoorer and the places to borrow money more and more inaccessible. A friend of mine were talking about the poor being too stupid to save, save WHAT?"

Nice, very nice. First, we are getting "poorer and poorer" (unless "andpoorer" is a word), but then places to borrow money are more inaccessible. Because… um.. *borrowing money* is the solution to your financial troubles when you are poor?

We are **not** getting poorer and poorer. Wages, by all measures and at all levels, have kept up with inflation through even recent decades. The wages of the rich have gone up much faster than inflation. Some people consider this an awful, unfair thing, saying "The wages of the middle class have **stagnated** since the 1970s". But that's silly, because we already had plenty as a society back then. We were just as happy. We don't need to keep earning *more and more,* even if the ultra-rich continue to do so.

Now, I'm not just making fun of this "poor-old-me" attitude because I find it annoying. I also see much bigger consequences.

A people who spend so carelessly that they are always within $1000 of doom is going to have a very short-term view of the country's future. Even a slight change in the price of gasoline, or corn, or other world commodities, or a recession, can send them down in flames.

With little understanding of world economics or politics, these people will naturally (but incorrectly) turn to the political party currently in power to place their blame. We're seeing this now, with approval rates of Obama among the uneducated at incredibly low levels. I can guarantee that if gasoline happened to be $1.49 per gallon and unemployment was 4.2 percent, my man would be rolling in record approval rates.

But the President doesn't set crude oil prices, nor does he dictate the short-term unemployment rate. So the only solution for these unfortunate politicians is to *pander* to the chronic overspenders, and pretend their problems are not their own. The political party which does this best, and most vigorously promises low gas prices and instant improvements in employment, wins. Despite the fact that low gas prices are actually awful for the country, and unemployment is controlled by the natural business cycle combined with longer-term effects of government policies (longer than a single presidential term).

It *would* be nice if the ultra-rich would use their money for social good instead of just passing on wealth to their offspring and buying jetskis, and to their credit, Warren Buffett and Bill Gates have done just that, giving more than 99% of their wealth back to humanity. But you'll notice that they aren't donating it to the American middle class so we can continue to "make ends meet" by buying tanks of gas for our 14MPG Chevrolet Silverados and keeping our cable TV service active. They're using their money to fight malaria in Africa and provide medical care and education and birth control to families there. People in situations like that are the ***only*** ones allowed to complain that there isn't enough money available in their society.

The rest have to shut up and start taking lessons from the Mustachians.

**Actually I admit this is an oversimplification. I already had at least $500 saved up before starting at the gas station, because I had also saved a portion of my $5 per week lawnmowing money and $30 per week paper route money for several years before starting at the gas station. Doing the math, you'd expect me to have thousands by the time 1990 rolled around,* *but you have to give me a break, I was only fifteen and thus still had 21 years of learning to do before becoming qualified to become Mr. Money Mustache. By the time I finished at the gas station and the subsequent convenience store, I had about $10,000, most of which I blew on my first year's university education.*

Become a Lazy Landlord – with REITs

By Mr. Money Mustache

Mon, 15 Aug 2011 12:00:52 +0000

Rich people come in many different flavors. Any established wealthy person knows that it is much easier and more profitable to have their money working for them, than to depend on using their own time and labor to work for money. That's why we call our dollar bills *employees* here at MMM. But beyond this common agreement, the rich people diverge on the best way to dispatch their employees.

Some, like Warren Buffett, buy businesses – also known as buying stocks. If you buy good businesses when their stocks are on sale, you see a steady stream of dividend income and the stock price appreciates due to growth and profits in the companies.

Others, like a number of smiling bald men with grey beards I know in my own neighborhood, insist that owning rental real estate is the only way to become rich, and generate a nice cashflow during retirement.

I do a little bit of each myself, although to a much smaller degree than my Bearded Mustachian neighbors, since I have only a limited need for riches – enough to fund the MMM family's excellent lifestyle, provide for plenty of future safety margin and allow random generosity a few times a year. Beyond that, the money would just be wasted on me since I'm not into powerboats, McMansions, or diamond rings.

So I've got this one rental house right now. The rent it brings in, after subtracting property taxes and other expenses, add up to 5.5% of the appraised value of the house. The rent goes up with inflation each year, and the value of the property also keeps up with inflation – or since there is a mild housing recovery going on in my area, it could be considered to slightly outpace inflation for a while until prices plateau out again. In other words, it is perhaps delivering a 6% return after inflation. And due to the major tax advantages of rental property ownership, the net income is closer to holding a stock that pays a dividend of 7% after inflation. Not a superb performance, since I actually have to do some work to manage the place, but due to our low living expenses, and the fact that there is no mortgage on either this rental or my main house, this house already more than funds the entire MMM family lifestyle. So all my other stock holdings, 401k accounts, and part-time income, and eventual social security payments in the distant future, are just gravy.

But as I've been landlording away all these years, occasionally having rather annoying experiences with tenants, I've been hearing and reading about REITs. Real Estate Investment Trusts. There are many advanced readers here who have been investing in and benefiting from these things for years, but there also many others who have never even heard the acronym before. So here's a quick summary before I present a few recent findings about REITs that make me feel like a fool for living off my rental house instead of letting someone else do the work.

REITs are a special category of company, only made available in the US in 1960. The key detail is that the company must invest most of its money in real estate to produce income, and it must distribute at least 90% of its income back to its shareholders.

So let's learn more by zooming in on one of these funds as an example, which I heard about through a friend. It's called Senior Housing Properties Trust – with ticker symbol SNH. According to the google finance link I just provided, SNH owns "*320 properties located in 36 states and Washington,* *D.C. Its portfolio includes 226 senior living properties with 26,380 living units / beds and two rehabilitation hospitals with 364 licensed beds; 82 medical office, clinic and biotech laboratory buildings (MOBs) with 5.2 million square feet of space, and 10 wellness centers with approximately 812,000 square feet of interior space plus outdoor developed facilities.* "

Holy Shit! That sounds WAY more advanced than my rental house. As insurance for a continued string of good renters, all I've got is the fact that I have a very nice luxury house with low maintenance in a high-end neighborhood. Better than owning a slum unit, but look at SNH – if I buy that, I am diversified across 36 states, in a market that is very large, wealthy, and stable – SENIOR CITIZENS.

Even better is the dividend rate – **6.86%***. In other words, his fund pays just as well as my rental house, but I don't have to do any work. Even though the tax treatment of the REIT dividends (which get treated as regular income if I read correctly) is not quite as good as rental house income, it's still a tradeoff I would gladly make. Plus, you can buy any amount that you want – $1000 gets you $68.60 per year, $10 grand gives you $686, and throwing in 350 thousand gives you about $24,000 per year, which will theoretically automatically adjust for you with inflation – plenty to live on!

Other REITs own things like apartment buildings, office buildings, commercial or industrial developments – anything where they can get a good stable rent. Usually things that you as an individual investor would have a hard time lining up to buy all by yourself.

There are two components to any stock investment – the actual share price ($21.57 for SNH at the time of writing), and the dividend yield. Most stocks in the S&P500 index pay much lower dividends, because their companies retain their earnings in hopes of investing in more growth. With these stocks, you depend mostly on share price appreciation to grow your wealth – i.e., eventually selling them off in small chunks for more than you bought them. With REITs, you don't care so much about the stock price, other than buying it low since that gets you a higher dividend yield (dividends stay the same regardless of share price, so if you can buy the shares cheaper, you are getting a higher percentage). For the record, the actual SNH share price has still outperformed the S&P index over the past 5 and 10 years, but underperformed during the last year.

When you look at the google finance link above, you'll also see a bunch of "related companies". These are other REITs, also with high dividends. To save you a few clicks, I have sorted them by highest dividend yield and pasted the list in here. The column on the far right is the annual dividend yield for each:

OHI	Omega Healthcare Inves…	17.10	-0.05	-0.29%	1.75B	9.80
MPW	Medical Properties Tru…	9.98	+0.08	0.81%	1.11B	8.19
HR	Healthcare Realty Trus…	16.10	+0.27	1.71%	1.25B	7.62
LTC	LTC Properties, Inc.	23.70	+0.70	3.04%	719.07M	7.40
SNH	Senior Housing Propert…	21.57	-0.03	-0.14%	3.31B	7.00
UHT	Universal Health Realt…	34.98	+0.07	0.20%	441.93M	6.60
HCN	Health Care REIT, Inc.	45.88	+0.71	1.57%	8.12B	6.37
HCP	HCP, Inc.	33.16	+0.62	1.91%	13.50B	5.93
NHI	National Health Invest…	41.90	-0.24	-0.57%	1.16B	5.86
VTR	Ventas, Inc.	47.50	+0.31	0.66%	13.68B	4.84

REITs like these are quite an amazing find if, like me just last year, you didn't realize such high dividends were available at the click of a mouse. A source of easy income in exchange for moderate risk – a risk I will gladly take myself for some of my continued retirement income as the portfolio evolves.

* *update – make that **8.78%** as of 2016, because the share price has fallen even as earnings are higher. So now $350k of this stock brings in $30,730 of income. But on paper the stock has "lost" money because its purchase price is lower in 2016 than in 2011 when I first wrote this. Also, I actually own some SNH shares now.*

World’s richest people are actually in favor of higher taxes

By Mr. Money Mustache

Tue, 16 Aug 2011 12:00:28 +0000

Well, my hero is up to his usual tricks again. Every few years, Warren Buffett makes a statement saying the taxes on rich people in the United States are too low, and he deserves and would be willing to pay more. This time he has backed it up by mentioning that many of his super-rich friends feel the same way (Bill Gates is actually one of them).

Stop Coddling the Super-Rich (NY Times)

Hooray for these guys, for telling it like it is. I actually find it bizarre that any rich person would be against paying at least enough taxes to let the country run in a smooth and deficit-free way with roughly the current level (or slightly higher) of public services. Less war spending and more replace-the-oil spending, of course but overall the level seems fine. Our tax load is so light at this current all-time-low record, it is almost unnoticeable.

After all, once you’ve got enough for yourself, your next goal for your money should be increased welfare of the world around you. This also happens to be the type of spending that gives people the most long-term pleasure so you don’t even have to be particularly self-sacrificing to do it.

If you know anything about Warren Buffett, you know that he’s all about the good of his country and of humanity in general. He has no reason to be selfish, and he has found that the more generous and honest he is, the richer the world makes him. Unfortunately, generosity and honesty alone do not make you a billionaire, but if you’re going to be in business working with other humans, especially on a big scale, you usually get further in the long run by *not* being a douchebag. Not many people realize this, because news coverage of rich douchebags is very thorough, but overall, having integrity pays.

I would like to speak up, as a member of the Middle Class, and say that I'm willing to pay a bit more in taxes too. We all should be willing. Not a shitload more, so that I can't even afford a house anymore, but say one or two thousand dollars more per year – a boost of about 25% of what I pay now, would be quite affordable. Most Middle Class folks don't realize this, because they are currently stuck spending most of their money on interest payments for expensive cars and the like. But once they wise up and realize that they have about 300% more income than they actually need to live, they too might feel a little better about taxes.

The key is having our tax money used efficiently. Being an engineer, I get pissed off when I see wasted resources. And the government, over the years, has certainly wasted plenty of resources. But on the other hand, the competition for the government is pretty easy to beat. Middle-class person buying an SUV and a bunch of fries and high-fructose corn syrup at McDonald's: 100% waste. Government subsidizing university tuitions: far less than 100% waste. I think that as long as we keep the government out of businesses that the private sector could provide more efficiently (designing products, for example), but use them in places where the private sector has been proven to suck (preserving groundwater quality, or providing national health insurance, for example), we will come out ahead. I think all spending should be published in great detail and easily be auditable by the public, as Obama has been doing if you look into it. And all public sector workers responsible for a budget of more than $100 of the taxpayer's precious money must first have a mandatory consultation with Mr. Money Mustache himself on the principles of efficient money spending.

Then we'll truly be a rich country.

Why did Mr. Money Mustache get Political today?

By Mr. Money Mustache

Wed, 17 Aug 2011 01:52:06 +0000

Well, that was interesting. I posted an article about rich people and taxes today, and the comments section rapidly exploded to set a record for activity. I'm glad to hear people are interested in politics, but I actually didn't intend that as a political posting.

So while the comments section of that article continues to get murkier and murkier like a toilet that never gets flushed, we'll start again right now with a fresh white bowl that explains the simple point I was trying to make the first time.

I liked Mr. Buffett's gesture because it represented a spirit of sacrificing your own immediate interests for that of your community/country/planet. The feeling that there is plenty to go around, and we should put our resources to work instead of hoarding them.

I wrote that even the middle class should be willing to do so, in the right situations, because that represents the spirit of thinking big, and being strong and open-minded and realizing we all have plenty of money to put to work as needed, rather than being small, whiny, and thinking the problems in your life are created by someone else.

The foundation of this whole deal, Mr. Money Mustache, is the fact that the middle-class people of America have great power, plenty of wealth, and lots of opportunity. Once we realize this, we can stop complaining about how hard life is and how corrupt this or that politician is, and get on with the business of getting Rich. As long as we're busy complaining, we're creating excuses why we cannot actually get it done.

I witnessed a silly conversation on Facebook yesterday, where one guy posted the Buffett article, and another guy made the point, "200k to 1M of income isn't what it used to be. This is not rich". Being a little bit fired up and not thinking clearly at that hour, I chimed in, "*What!? That is a shitload of money! I have been retired for six years and I never even made close to that level of income! Even 60k is a damned healthy salary*".

Even after reading my point, this young man said this, "… *$60k is a barely scraping by salary in Ottawa for a family. Just affording the mortgage on a $300K house requires more than that without over leveraging. Good luck getting a family sized house for that in Ottawa. If you lived in NYC, Boston, Vancouver, a $100K salary would get you squat (maybe a small 2 bedroom apt with a parking spot)….*"

And that is EXACTLY the point I am trying to make. Facebook Guy will still be stuck working for many years, Mr. Money Mustache graduated long ago. Because of the attitude of "*Appreciate what you have, and make it work for you, instead of complaining it is not enough.*"

That's all. No political commentary required.

Royal Wedding, Shloyal Fledding

By Mr. Money Mustache

Wed, 17 Aug 2011 12:21:23 +0000

It's time for Mr. Money Mustache to attack another one of America's most sacred traditions. Marriage. Well, not marriage specifically, but those fantastic and fancy parties we call weddings.

Now, in case you hadn't figured it out, from an American perspective, I might as well be from another planet. I grew up in a small town in Canada, in a frugal and somewhat bizarre family where love, rather than manufactured products, was the chief currency. We also missed out on any concept of tradition, religion, and even most of polite society's Social Norms. We are generally a clan of nerds, reading many books and practicing as Spock-like engineers and armchair scientists, but not often seen on Celeb magazine covers in the grocery store.

So when I came into adult life, I got to learn quite a few new things just like Starman or The Terminator did when they first came to Earth. I learned (or am still learning) that people love to be made to feel special on their birthday, a tradition I heartily accept. I also learned about some very bizarre traditions, like those practiced by the world's various competing religions, and most significantly for this article, what people do when they get married.

What I learned is that it is entirely common for you humans to spend *months* preparing for a wedding, including renting special buildings, hiring various contractors to provide exotic services, buying clothes that will only be used once, inviting guests that are not people you speak with every day or even every month, and even trying to create "appropriate" appearances to various branches of the extended family.

Fellow aliens might read that paragraph, and say, "Well, yeah, you're talking about the wedding ceremonies of the very rich, right? Like the Royal Wedding that happened in England this summer? Don't try to understand Old Money, they have their own crazy Power Dynasty thing going."

But no, it's more interesting than that. Royal weddings started out in the domain of kings and queens, but they have trickled down into the realm of the middle class, such that it is now common for ***ordinary nonmillionaires to spend an average of $24,000 on their weddings.***

As some icing on that wedding cake, I also learned the social norm is for a Man to spend "two months' salary" for the engagement ring ($10,000 or so!?), and then immediately after the wedding, take off for an international honeymoon at an all-inclusive resort.

Some of these brides and grooms are the same people who have borrowed to pay for their cars, put less than 20% down on their houses, and claim to Mr. Money Mustache that retirement before 65 is impossible.

Like the first person to burp after a serious speech, it's time for Mr. Money Mustache to be the first to say it: It's Okay to break this tradition. These Ultraweddings are so ingrained (surely in part by the efforts of the profitable wedding industry itself) that people think they are having a "low-key" wedding if they only have 100 guests or only spend $5,000.

I'll tell you how to have a wedding.

When my wife and I decided we were adult enough to get married (just before age 30, after 10 years of togetherness), we put on our best sandals and walked downtown. We went to the county clerk's office, where they record important events like property transactions, births, deaths, and marriages, and we said we wanted to get married. "Congratulations!" said the nice lady there, and gave us a pretty diploma-like document to fill out, with a golden seal in the corner. A marriage license. We filled it out and submitted it.

The total cost was $10.

One of the paragraphs you have to initial says something like "I hereby agree to have a ceremony to declare this marriage effective". So we hiked to the top of a mountain at the edge of Boulder, Colorado and under a towering arch of rock, declared, "We are married!"

Later we invited all the local friends over for drinks and nicely made food at our house. And the following summer, we repeated the party in Canada for friends and family who happen to live there.

The whole experience shines on as a golden memory, just like the marriage itself. Nobody had any less fun, or got any less married, despite the fact that we spent at least 98% less than the average. Even though we could have technically afforded to pay for even a rather fancy wedding without borrowing at that point in our lives.

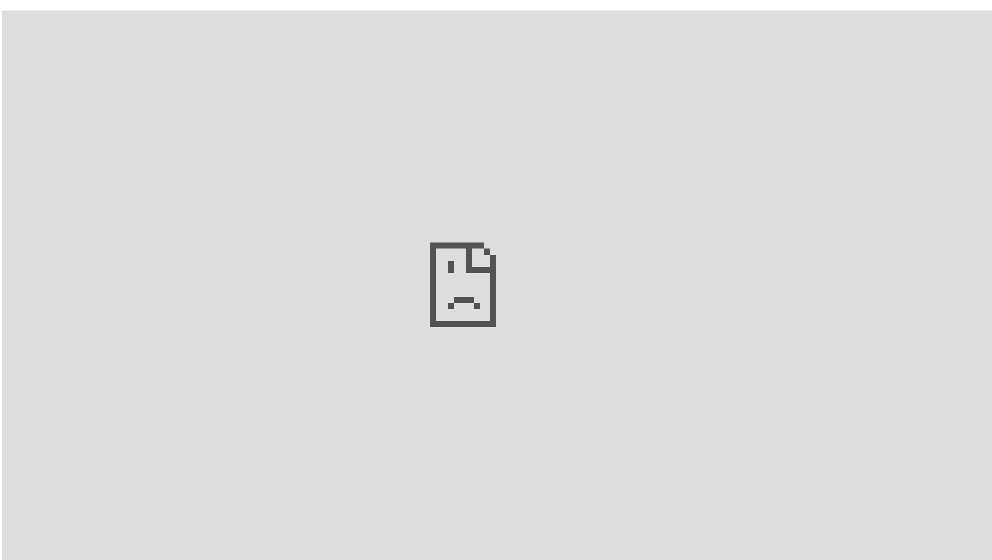
In fact, not spending excessive money on a wedding provides a life-changing boost to a new couple's financial situation. Quite a large portion of divorces are caused by financial problems. So it could be reasonably stated that it is far *more* romantic to have a low-cost wedding.

So here’s my prescription for marital bliss: Plan your wedding party just like you would plan any other phenomenal bash you would host at your house. That’s right, it will be at your house, or your parents’ house, or at a local mountain, forest, or other natural area. Don’t allow your friends to bring gifts – just as your friends should not ask for gifts from you when they get married. The photographer will be whichever of your friends has the nicest camera. The caterer will be your parents, or a large take-out order from your favorite local restaurant if you can afford it. You can buy beer and wine for everyone, and your heaviest-drinking friend or family member can be the unofficial bartender. Make sure everyone has a great time, and spend your energy talking and laughing with the people most dear to you rather than rehearsing elaborate walking patterns and selecting floral arrangements.

As you say your vows, Mr. Money Mustache himself will be blessing your union.

Further Entertainment:

This amazing video on YouTube summarizes these points with much more style than my article ever could:



Amusing Updates:

- Some kind person published a link to this article on Reddit. The ensuing comments reinforced my suspicion that even though this idea of "don't spend twenty grand on a party until you are at least a multimillionaire" seems very reasonable to me, the rest of the world still thinks my idea is crazy. Either they don't like the idea having the option of early retirement, or they have not yet made the connection between firehose spending and financial independence ;-)
- Today's automatically generated ads at the side of the article are all for Royal Wedding type services. "Engagement Diamonds!, Bridal Registry! Macy's! Tiffany! Limousine service!" Very amusing and ironic, but just reading them makes my Money Mustache ache.
- Because of this article, Mr. Money Mustache is now the world's #1-ranking search result for the word "Shloyal". Now that is status.

The next Stage of Retirement begins: Kindergarten

By Mr. Money Mustache

Thu, 18 Aug 2011 19:15:43 +0000

 Today is a memorable day in the MMM family, as the Mrs. and I took our precious Junior 'Stash to start his first day of Kindergarten this morning.

It was a wonderful experience, biking through the early morning's leafy shade on our streets, and feeling the excitement and fear of the assembled crowd of young kids and their parents as we waited in the school's courtyard for the opening bell. The simultaneous start of so many school careers, each one destined to play such a gigantic role in forming the future adults. I noticed quite a few shiny cheeks among the Moms, and even a few discrete fingers poking around the periphery of the sunglasses of the Dads.

It's also a fork in the road of life for an Early Retiree. When our boy was born, we pretty much abandoned any other commitments to take some time to learn to become parents. Even though other parents with multiple kids and simultaneous jobs have it much tougher, we still found it to be quite a challenge*. For the first two and a half years, it was just us and him, with as much family and friends as we could fit in. Baby milestones mixed with years of sleep deprivation and new parent pride. Milk and mushy food, cloth diapers and little clothes, days at the creek and the park.

As the years have crawled past and both parents and child have grown together, we have started taking baby steps back towards traditional adult life. The boy started with one day of preschool per week, the next year it was two days, the next year was three. We started scaling up our part-time work again, and returning to more adventurous family vacations, and even having time for Independent Adult fun. Nowadays, Mrs. M. goes out alone for a couple hours of crossfit three nights per week, and I'm heading to the mountains for a Gentleman's Backcountry Camping weekend tomorrow, just as some recent examples.

And now all of a sudden, he'll be in school five days per week for the next seventeen years or so. We're still adjusting to this new idea. We celebrated the transition by having breakfast on a restaurant patio near the school and having a serious but fun conversation. What will I do with my days? How will I make sure they are put to good use? Will I get a TV and start watching sports, or perhaps get myself a walker and a golf cart so I can take up Sedentary Golf?

I'm just kidding.. there is actually a huge backlog of stuff to do with this new free time. I want to make my house Energy Independent by adding some solar heat and electricity systems. I want to fix up the gardens and lawns and build some high-end cold frames so I can grow vegetables year-round. I want to ramp up the guitar and drum playing since making music is one of the most basic and Native-style sources of pleasure to me (but for some reason I can only do it in the presence of excessive free time). I want to bike to places around here I've never seen, and go through a crazy fitness program like the P90x to force myself to get off the current lazy man's fitness plateau. I would also like to crank out some profitable local construction projects like doing a classy renovation and resale of an undervalued house on my own street or setting up another rental property. And of course I want to read more books so I can talk through my hat a bit less and quote more respected researchers and authors when I'm dishing out the lessons.

Things like this really do happen in early retirement as long as you write ’em down in an artistic font on a nice piece of paper and stick it on your fridge. Lots of my current favorite hobbies in life (childraising, welding, plumbing, the aforementioned drums) started the same way a few years ago. It’s just that it is now time to take it up a few notches for the next seventeen. Here we go!

*My theory on this is that child-raising is so difficult that it blasts past your previous limits of human accomplishment even after the first one. Just as humans were made to do, you adapt and start doing what it takes. People with more kids, and/or full-time jobs, and/or dealing with poverty simply get even more badass and do even more of whatever it takes. Of course, there are limits to human capacity and both surrounding environments and individual abilities vary widely, so some kids fall through the cracks.. but overall I’m amazed every day at what parents do for their kids. It revives my faith in the ability of humans to accomplish things.

Guest Posting – Get Rich With: Scooters

By Mr. Money Mustache

Fri, 19 Aug 2011 12:31:37 +0000

Today is an Exciting Milestone in the Mr. Money Mustache blog – our first official Guest Posting!

This Instant Classic essay comes from a reader with alias 'Poorplayer'. He seems to be an older, East-coast version of me, complete with a similar writing style. Good fun.

Thanks very much for the submission, Mr. P.!

Get Rich with: Scooters

Not all of us can be crazydog cyclists like MMM. Some of us are not quite in cycling shape, some of us may be physically unable to bike, some of us may not quite have enough time in our day to bike everywhere, and some of us might just be uninterested in cycling. But we sure would like to find some way to save all that money we waste tooling around town even in our efficient used Toyota. My answer to this dilemma is…get a scooter!

I first got into scooting in 1976 (which shows my age) back when I worked in Queens NY and lived just over the Long Island/Queens border. To commute to my first job I bought a 1976 Puch moped. This was a true moped, a motorized bike with pedals. I rode this about 12 miles one way through the streets and boulevards of Queens. Even back then, when gas was $0.60/gal., I realized gasoline was a limited resource that needed to be conserved. Also the first OPEC oil embargo brought shortages of gas to the US, and gas rationing brought long lines at the pumps for limited supplies of gas. So the Puch was something that allowed me to get through that time more easily than most. That's what first hooked me.

I bought my next scooter in 1991. A colleague was trying to sell his daughter's 1989 Yamaha Razz, and I bought it for $600 with very few miles. It was a far cry from my Puch. A flat running board to rest my feet, twist-and-go throttle, a wide seat, and a rack on which to put a milk crate or other carrying case. Not only that, but it mixed its own oil and gas! It had a 50cc motor, so no need to get a motorcycle endorsement. Driving around town was now not only dead easy, it was fun!

My current ride is a 2009 Kymco People S 250. I sold the Razz for $300 (nice return over a 19-year ownership). The Kymco is made in Taiwan, tops out at 85MPH, and gets 65MPG on average. It's pretty much my principal mode of transportation from mid-March to mid-Nov. (I live in a snow belt region in upstate NY). I went and got the MC endorsement for this – one more off the bucket list!

It's a real puzzle to me why most Americans won't consider a scooter as an alternative to a second car. It seems to be some sort of cultural prejudice. In most third world countries the scooter is the most popular form of urban transportation – the streets are filled with them. I think scooters hit the sweet spot between driving a car and biking in urban areas. A 50cc scooter new costs maybe $1200 on average, with the high end at $2K. No doubt used models can be found on Craigslist or eBay for much less. In most states a 50cc scooter can be licensed and driven on city streets where the speed limit is 45MPH or less (in CA they have to be C.A.R.B. certified, an emissions issue). Even on state highways and county roads they can legally be driven on the shoulder. The cost for insurance is about $5.00, and registration usually costs the same. A 50cc scooter gets about 85-95 MPG, and has a top speed of about 30 MPH*. Add a luggage rack or saddle bags, or even a roomy backpack, and you have the perfect errand-running and commuting vehicle for urban areas.

How much can you save? Well, I'm not a numbers guy, but it doesn't take too many brain cells to realize that a gas-powered vehicle with an annual fuel cost of about $300/year is going to save a lot of money over a second car. Even a car rated at 30MPG in city driving is using 3x more gas per mile than a scooter. Repairs? Almost nil. Change the spark plug on a 50cc scooter and you've done a tune-up. Heck, these things in some ways are as cheap to maintain as a bike.

Now, perhaps some of you guys reading this might think a 50cc scooter just isn't "manly" enough. Well, I have noticed how Mrs.MM has been urging the ladies to change their perceptions of what it means to appear womanly, so I say to the guys out there – get over your damn macho selves! Know what? My Razz was PINK when I bought it, and I got quite a few stares and laughs over the years riding my Bahama-colored scooter. But I could always laugh back, knowing I was building my 'stash to send my 3 kids to college debt-free. And I think making sure that your kids start out their lives college-debt free is pretty fuckin' manly! I'll let you ponder that shit for awhile, so maybe you'll give a scooter a second thought.

More information can be found at this fun and breezy web site about scooters. I've found scooter riding to be one of the most fun and effective ways to cut down my transportation expenses significantly over 30+ years of scooting. It's maybe the biggest secret out there to putting more cash in your pocket while maintaining the convenience of motorized transportation and keeping a light footprint on the environment. So if you can't quite make the giant leap to high-octane cycling, and hypermiling makes you a little crazy, think about investing in a scooter. I'm pretty sure you won't regret it.

*Rumor has it that a 50cc can go faster than 30 MPH if it is de-restricted. Doing this, however, may make your ride illegal.

MMM Note: I heartily agree with this strategy, although you still should eventually throw in as much biking as possible, it's even better for you. Also check out the electric-powered scooters that are available these days such as this one from e-Moto. Prices vary widely if you shop around, and with the benefits of zero tailpipe emissions (actually almost zero overall emissions if you use only wind or solar-generated electricity as I do) and no noise, you can feel even more Mustachian about your urban commuting.

Grocery Shopping With Your Middle Finger

By Mr. Money Mustache

Tue, 23 Aug 2011 12:53:11 +0000

The Grocery Store is the only retail establishment that I visit more than once a month. But even then, we have a bit of a love/hate relationship.

I **LOVE** the grocery store, because it is the source of almost all of my food. Under its roof lies a world of unlimited possibilities. It can help me cook up almost any recipe on Earth, and by selecting the right foods and avoiding the wrong ones, I can ensure a fantastic level of health for myself and my family.

But I also **HATE** the grocery store occasionally, because about 90% of the products in there are pure crap. Colorful boxes and disposable plastic packages containing mostly ridiculous chemicals, colors, and artificial flavors, all mixed over a base of high fructose corn syrup, partially hydrogenated oil, and refined white flour.

These things are big contributors to our country's startling waistline, and while I believe we should still be free to make, sell, and eat these products at our own discretion, it saddens me to see such incredible effort and environmental resources going into creating things that logically should not even exist.

The grocery store also earns my rage with its ever-tricky pricing scheme. Besides the mental filtering required to seek out that Healthy 10% of items not covered by the previous paragraph, there is also a wildly fluctuating game of price-gouging going on at my store (which happens to be Safeway).

Lucerne Organic eggs are sometimes $2.99 for a dozen when they are "on sale", otherwise they are $4.59 and a competing brand becomes $2.99 instead, or some amount in between. Apples can usually be found for a buck or so per pound, except when you grow complacent and they jack them up to $2.49, resulting in you buying yourself a $15 bag of apples if you aren't paying attention.

Today I needed tomatoes and they had temporarily risen from 99 cents to $3.99 per pound, so my little handful cost me $5.69! Later I learned there is not a nationwide Tomato Embargo as I had assumed – they are still 99 cents at the other grocery store, but Safeway just decided to give ol' Mr. Money Mustache the shaft in the name of profit. (But now they're paying for it in the form of bad PR, aren't they? Take that, you $3.99-a-pound-chargin' bitches!)

At least you can take comfort that some prices are always stable. Specialty items like little packages of Basil leaves and gluten-free bread mix and the comedically priced fitness supplements depicted in the headline picture of this article follow a year-round ridiculous shaftola pricing scheme.

So what's a Mustachian to do in a situation like this? I like to call it Grocery Shopping With Your Middle Finger, and here are the main ingredients:

Know the Right Price: I've been the family's main grocery shopper for years, so I know exactly how much all of my main staples should cost. Interestingly enough, I've hit grocery stores all across the US on road trips, and I find the prices are surprisingly consistent across the land. That makes it easy to shop efficiently, even while on vacation.

If prices are ever significantly above the “right” range, I discreetly stick up both of my middle fingers, swear under my breath, and move on to a substitute good if possible. Conversely, if prices are below the normal range, I’ll stock up like crazy.

For items with a long shelf life, this can lead to some interesting results, like the time I bought 20 jars of Classico pasta sauce because it had dropped from $3.50 to $1.50 per jar, or 20 boxes of Quaker Oat Squares cereal because it had temporarily been marked down from $4.50 to $1.00 per box. The cashiers raised an eyebrow each time, but each of these purchases saved me about $50 over the regular price for these products… and gave me a nice inventory at home to help reduce future trips to the store.

I like to think of it as a little algorithm:

- If a food is overpriced, buy zero or the minimum possible amount you can live with
- If a food is regular price, buy an amount to last until your next grocery trip (minimum 1 week supply)
- If a food is underpriced, buy at least enough to last until the next expected sale at this level (4 weeks?)
- If a food is drastically underpriced, buy a near-infinite amount, limited only by shelf life of food and available stock on shelves. If Bananas go to 1 cent per pound, you can’t really benefit aside from maybe freezing a few. But if my favorite cashews and almonds mix dropped to an all-time low, I’d probably buy at least a year’s supply (twenty of the two-pound jars or more).

Use Healthiness and Cost Per Calorie to decide what to eat:

I love blueberries and raspberries, and they are good for you. But for most of the year, they are ridiculously expensive – as much as $5.99 for a tiny handful in a 4-oz container. Those 64 calories are costing you 9.35 cents per calorie. To live solely off blueberries at 2000 calories per day, you’d spend $187 per day ($68,255 per year).

On the other hand, I also love old-fashioned rolled oats*. These can be had for about 70 cents per pound in 9lb boxes at Costco. A pound of rolled oats contains 1714 calories – and fantastic ones too, rich in fiber, protein, and iron. This cost per calorie is 0.041 cents.

In other words, **Blueberries are about 229 times more expensive than Rolled Oats!!** If I lived solely on rolled oats at 2000 calories per day, it would cost me 81.6 cents per day to eat, or $298 per year.

You can use this *cost per calorie strategy* to optimize your eating – not compromising on health, of course, but just shuffling around healthy foods so that cheaper ones get eaten more.

As a few more examples, I personally eat loads of

- mixed nuts at about $5 per pound (2720 calories per pound, yielding 0.18 cents per calorie)
- natural (peanuts-only) peanut butter ($2.50/pound, 3000 cals = 0.08 cents/cal)
- Whole milk ($4/gallon ,1760 cals = 0.22 cents/cal)
- Bananas (0.69/pound, 500 cals per pound = 0.138 cents/cal).
- Basmati rice (0.60/pound, 1600 cals = 0.0375 cents/cal)

Meat is more expensive, for example steak or chicken breast at $5.00/lb for 560 calories yields 0.89 cents per calorie – about 11 times more than the natural peanut butter, which is just as good for you in many ways.

Protein, of which I'm a big fan, can easily be supplemented with beans and rice, cheese and eggs, and 6 lb bags of whey protein powder that you can mix into shakes (also from Costco).

Avoid Cutesy little Containers of things that cost $8.00

Nowadays, organic and healthy food has caught on in a big way, especially among the affluent 20-to-40something crowd. When you combine a desire to do the right thing, with the typical free spending middle income earner, you get a highly profitable Sukka Consumer. And Whole Foods and Natural Grocers are right there to make the most of it, with tiny little jars of Mrs. McFancyPants's Natural Ostrich Feather Butter for $18.99 and Jack

McGillicuddy's Organic Maple Elven Unicorn Syrup Crisp cereal for $77.59 for a 2-serving bag. When I visit the homes of middle-income people these days, I find the pantry absolutely loaded with these big-ticket small-quantity items, and then I understand why their grocery bills are $1000 per month.

Buying luxury health foods from small companies is a great thing to do if you can actually afford it – you're stickin' it to the unhealthy factory food system and Monsanto, while supporting the growth of healthier small companies. But if you're not yet retired, you can't afford it yet, so why not compromise by buying any *reasonably priced or*ganic food you can find at a regular grocery store, build up your 'stash for now, and then switch to the boutique stuff after your first million?

I also eat fruits and vegetables at every meal, despite their higher cost per calorie, just for the sake of deliciousness and having a healthy balance. I just lean towards things like cucumbers, carrots, apples and bananas, rather than out-of-season blueberries and raspberries from New Zealand, except for special occasions.

To put it all into perspective with an example, let's review the typical MMM family grocery list for one week. In the earlier "Exposed!" article, I found that we spend an average of $74 per week. Here's the breakdown. Most foods listed are organic when available at reasonable prices.

Milk: 2 gallons at average $3 (since I only buy organic part of the time): $6
Eggs: 2 dozen at $3.50 each: $7
Bananas: 6 lbs at $0.70: $4.20
Apples: 3 lbs at $1.50 each: $4.50
Misc. fruits and vegetables: 4 pounds at $2 each: $8
Spaghetti (rice noodles gluten free): 1 lb at $3.50
Spaghetti sauce: 1 jar at $3
Chicken, Beef, or Fish: 2 pounds at $6: $12
Cereal, including oats: 2 pounds at $1: $2
Cheese: 1 pound at $3
Coffee: 1/2 pound at $7: $3.50
Various kinds of Beans, rice, whole wheat flour: 3 pounds at 0.60: $1.80 (I make my own bread, yum)

Apple Sauce: $2
olive oil: 4 oz at 0.25: $1
Miscellaneous stuff like dark chocolate, protein powder, spices, recipe ingredients, occasional ice cream, whatever: $10.

This is just a typical list, and it's an estimate based on buying some things weekly, and other things on the quarterly gigantic $300 stock-up at Costco. The main things I might find noteworthy is that it adds up to the mid $70s weekly for a family of three, it's mostly organic food and meat, and there is pretty much zero processed prepackaged stuff or desserts in there. It could be cut in half if we switched to non-organic food and dropped the luxury meats and coffee, but hey, as I always say, the MMM family leads a luxurious and decadent life despite the below-average overall costs :-))

*** Mr. Money Mustache's Amazing Save $100 on Cereal Per Year Trick**. Not everyone loves cereal, but *some of us* are addicts and could eat it all day. You know who you are. I have at least a couple bowls daily myself. Four years ago, I invented a trick where I substitute 50-75% of the cereal for plain rolled oats (uncooked, straight out of the container), then pour regular sugary cereal (like honey bunches of oats or raisin bran) on top of that. Mix it up, add some bananas, and you have a super-nice bowl of the good stuff! I actually prefer the texture and taste of this over regular boxed cereal. For every pound of oats you use up doing this, you save about $2.00, since cereal in boxes costs around $2.70/pound and oats are only $0.70. I kept track for a year, and found I had used 50 lbs of oats. I've saved $400 so far with just this trick, and it helped me sharpen up the abdomen as well due to the reduced sugar and higher fiber!

An update, two years later: Since writing this article, the adults in our family have switched to a lower-carbohydrate and higher-fat style of eating, with even better results. Instead of cereal, I have a heartier breakfast with eggs and avocados. Less pasta and more stir-fried vegetables. If your current plan works for you, stick with it. But if you ever need to lose fat, try dropping all bread and sugars (including most fruit juice – eat the fruit instead) and see what happens.

Good Day to Buy a Bike

By Mr. Money Mustache

Wed, 24 Aug 2011 18:19:55 +0000

(note: this is a dated article that referred to a sale so the links stopped working. I updated them in April 2012, but they'll surely change again someday)

Hello there.

I don't really have an article for you today, but I stumbled across an interesting-looking sale at one of my preferred bike stores, Nashbar.com. They've got a free shipping deal on orders over $50, and some pretty sweet discounts on the end-of-summer 'stash of bicycles. Looks like the sale only goes for about 2 days from the date of this article.

Here's a link to their commuter bikes page, sorted from price low to high, in case you're in the market.

Or if you want even easier advice, for a first-time bike owner who wants "just a good solid reliable bike for getting around the city and suburbs", I'd recommend something like the GT Transeo.

I've bought 2 bikes from Nashbar in the past. They were both great – the only slight hitch is that they come to your house in a big box, and you have to put on the handlebars, wheels, and pedals to have it in riding shape. I found all the gears and brakes were already adjusted and working well.

I've also bought bikes from Craigslist – it is the more sociable and environmentally friendly way to go, and the bike will already be assembled. It just depends on your area. Here in the Boulder, Colorado area, high quality bikes and careful bicycle owners are very common – so the experience of buying used is very positive. In an area or state where biking is less popular, it might be frustrating to find a good used bike, or you might have to drive many miles to pick it up. In that case, ordering online and having it show up on your porch can be very nice.

Plus, with a new bike of reasonable quality, you generally get at least 2000 miles of luxurious trouble-free riding before anything even needs adjustment. My 2008 city bike from Nashbar (a K2 Astral 3.0 which cost me $299 during a similar sale) is still going strong and is in perfect shape, coming up on 2000 miles of city errands.

Groupon? Never heard of it.

By Mr. Money Mustache

Thu, 25 Aug 2011 18:03:21 +0000

like this list on Wisebread.com) are actually shopping sites disguised as benevolent dispensaries of financial advice. I checked out the websites like Deal Seeking Mom and Money Saving Mom, and various others from the top ten. Then I checked out another service that has become popular among people with the desire to save a few bucks: Groupon.

The thing I noticed about these sites is that they seem to focus on buying things, rather than not buying things. One site had a picture of an attractive makeup-wearing woman's face and the text "Request a Free Olay Sample Pack". This wasn't an advertisement, it was an actual article. Groupon had all sorts of deals like "Sushi for Two for only $22 at this restaurant in YOUR town! – 50% off! .. Sign up for daily emails from Groupon!"

Even though I'm Mr. Money Mustache Himself, I must admit I was immediately tempted. "Hmm, I do like Sushi. Maybe I should go out tonight? I wonder if they have any deals on tools or bikes? And I am down to zero pairs of jeans without major holes in them, perhaps I should look for Old Navy or Target coupons as well?".

See, while the deals presented on these sites are indeed good deals, the problem is that they are creating *wants and perceived needs* inside me, where only contentment existed before. Think for a moment about the quote from one of the nation's Founding Mustachians, Henry David Thoreau: "A man is rich according to the number of things he can afford to let alone". I believe one of my biggest advantages in the battle to maximize happiness while buying less stuff than most people, is *not even knowing what stuff is available to buy*.

This is one of the many reasons that I suggest that you, as a rich person in the making, should not even have access to broadcast or cable TV of any sort. The advertising, and the lifestyles portrayed on TV, and even the product placement in movies, is just too powerful to not trick you into wanting unnecessary stuff. (And regardless of the advertising, there is just too much interesting stuff to do in life – every second spent watching TV, no matter how interesting it seems at the time, just causes you to miss out on even greater fun).

I actually hadn't heard about Groupon at all until just a few months ago, and I only visited their actual website today, as part of the intrepid and painstaking research process I do for each of these articles. But my wife, Mrs. Money Mustache, has her own secret research line into The Real World*. It's the collection of other ladies she knows through real and internet relationships, both in our original hometown and our new one. Since these folks are not part of the unusually wise group we call MMM readers, she gets a sneak peek into what Actual Consumer Ladies are doing with their time**.

What she sees is amazing. Financial disasters in high-income families. Acres of expensive products and vacation destinations strewn across Flickr photostreams. And through it all, a common theme that it is tough to get by financially in modern life, so we must use Groupons and Online Deal Seeking to make ends meet.

I would suggest that while coupons do actually get you discounts, the most profitable route is still to keep yourself off of as many mailing lists and deal websites as you can. When we moved into our current house, I did the usual trick of contacting the direct marketing association at dmachoice.org and blocking most paper junkmail (it really works, the maibox can stay empty for days at a time these days). But I have still felt the tickle of temptation from a stream of sneaky catalogs that has started coming to my house. I'll buy a tool or a guitar stand or a bike part, and it will trigger a stream of Harbor Freight, Musician's Friend, and Nashbar paper catalogs flowing to my house. Despite my best intentions, I find myself pausing just before tossing them into the recycling bin. Just a quick peek. And an hour later, I'm topping off the cart to the level required to get the free shipping. Now I get beer brewing ones as well. Sigh.

The thing about *stuff* is, you only need a certain amount of it, even when you are leading a decadent middle-class life as you and I are. When I graduated from school and bought my first house, it was empty. So I did go out and buy a lot of stuff. Couches, microwave oven, pots and pans, a vacuum cleaner, a suitcase, the whole lot. I did it inefficiently by my current standards, since Craigslist was not yet invented and neither was Mr. Money Mustache. But the key is that it was a *finite* amount of buying. Now I still *have* all that stuff. So I don't need to buy most of it again for many decades. Without advertising, you only need new stuff when your old stuff breaks beyond repair***. But really, for a person of my age, the spending on new stuff should be at an absolute trickle, because things don't really break all that often.

So, I'm investing the rest of the morning in contacting each of the companies and getting off of their lists, permanently. And I did NOT type my email address into the box on the Groupon website.

*(much like the telephones they use to talk between the Real World and Matrix spaces in the movie.. except here on MMM the worlds are reversed: I refer to the fake consumer world outside the cozy enlightenment of the Mustachian Community as the Real World, even though those people are technically more like the people still stuck in the Matrix. Some day we may have to change our terminology to resolve this confusion).

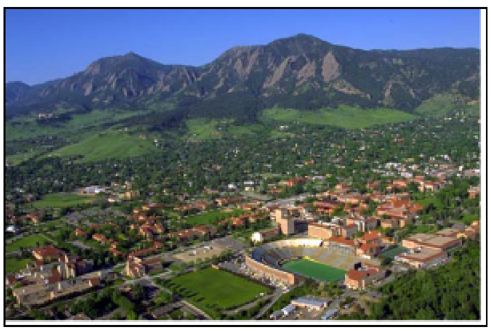
** Of course, Consumer Men also exist in vast numbers, but I don't have access to such a large group on my own Facebook account.

*** I recently thought this had happened to my 1999 vacuum cleaner. It was purchased for about $60 at Costco during that initial flurry of house-filling purchasing. It's an upright vacuum cleaner and the handle developed a crack and started flopping off of the body. I had been vacuuming delicately with it for the last couple of years, and contemplating replacing it. Then I manned up a little and went out to the garage and fashioned some metal splints for it with holes drilled to screw into the main body. It’s now sturdier than it was when brand new, and I am confident it’s good for another 12 years.

The Joy of Getting Laid off from your Job

By Mr. Money Mustache

Sat, 27 Aug 2011 12:13:09 +0000



A few weeks ago, I got a call from an old friend. He was a coworker at a company where I used to work as a software engineer.

“Hey man, I’ve secretly become a Mr. Money Mustache reader over the last few months. And now it looks like I need some advice from MMM myself, because the company is shutting down our whole department and laying off every single employee there. What should I do?”

What I said was, “Congratulations! You should celebrate!”

I can see how a layoff seems scary, because it is messing up your stable life and taking you out of your comfort zone. And for folks who have not yet embraced a Mustachian lifestyle, it could even cause some financial problems, because you might have large monthly bills and only a small ‘stash to survive on.

But scary monthly bills were not the pressing issue for my friend. He had held this job for almost twenty years, raking in a solid engineering salary and living only a moderately lavish lifestyle. And when this particular company does layoffs, it always gives you an extra six months' pay for good measure, just as a way of showing it is a company with integrity. So although he hadn't planned specifically for an immediate retirement, he at least knew no collection agencies would be knocking on his door in the near future.

The problem was just that he didn't know what you were supposed to do when your job disappears. He had been shaken out of a comfortable snooze and all of a sudden was forced to start doing some independent thinking and making some plans.

"Oh, whoa, what is going on here. Do I start applying for another job? Do I want another job? Do I have enough savings to live off without working? If I don't work, what will I do with all my new free time?"

All around him, his coworkers were awakened as well. They were all the same people I used to work with in the early 2000s. Some of them dusted off their resumes and fired them out – and got hired immediately at other high-tech companies in the area. These people got fresh exciting jobs where the learning starts anew and the energy level is high, with the bonus of higher salaries, and the "double salary" for six months from the layoff package. Some others may still be looking for work, but with a large safety cushion of cash backing them up.

Others decided that they had spent enough days in the office and were ready to try their hand at the rare sport of Early Retirement. I'm proud of these people, because they are about to do some real learning again. Exploring new fields of study, meeting loads of people they would have not otherwise met, taking care of things that had been put aside for "someday when I have time".

I believe that life has much more to offer us than doing the same thing every day for the majority of our waking hours. But I've read that our brains change if we keep ourselves locked into routines as we age. Over time, people become addicted to the routine of work, and eventually that's all they know – it becomes impossible to let go or really experience anything else.

This might sound scary to some, and comforting to others. All I can say is, I sure as hell don't miss my own comfortable job, and Variety is the Spice of Life. I'm not suggesting that everyone go out and quit their jobs today, but I am suggesting that once you can afford it, you should give it some fuckin' serious consideration.

For cautious people who have had the same job "a little too long" (which I'd define as ten years or more), but just never end up quitting because it is too cushy, a layoff just may be the best thing that could happen.

As for my friend, I think I convinced him to have a go at being an Independent Man. We discussed the finances a little, and it looks like his 'stash will be plenty to provide a comfortable lifestyle that more than keeps up with inflation, forever. And he is slowly peeling off the layers of cobwebs that had caked on over those 20 years in a cubicle, and coming out blinking into the bright Colorado sunshine. Congratulations, brand new Mustachian!*

(*he really does have a mustache, lending even more weight to this story).

Reader Case Study – How can I Climb out of the Gutter?

By Mr. Money Mustache

Mon, 29 Aug 2011 16:41:03 +0000

A couple of weeks ago, Mr. Money Mustache received a request for help that threw him off balance a little:

Dear MMM,

I just found your site from lifehacker. Your articles are very good. But I did notice that they are all written from the perspective of someone with assets. I would like some advice. I'm only 22, I'm upside down on my car, I have recently lost my job and can't seem to find another one. I'm recently married, and my savings just dried up. I have a few hundred left of wiggle room on my credit card.
I'm not particularly skilled with much, but I'm good with computers. How am I to build myself up financially in this crazy world and down economy when even fast food jobs seem hard to come by? This next part sounds bad but I want to do it rather quickly. Zero to hero asap kind of thing. My wife's studies are rather expensive.

Wow.. this guy is right. I have been writing mainly from the perspective of people with jobs, and fairly reasonable starting points, financially. But what do you do when you have fairly low expenses and debt, but an even lower income? So I wrote back to this guy and asked him for a few more details. Here's what I learned:

Other Details:
Monthly Cost broken down into categories:
Debt: $223, Insurance: $120, Rent: $800 Phone: ~$90 Internet: $52
Gas: $60, Gym: $60 (Use it 5 days a week) School: ~$200
We currently get food assistance from the state @ $220/mo.
"Useless spending" (i.e. shopping) is kept to about $109/mo.
The only income we have right now is $590 every two weeks.
Skills: photography and part of a computer science degree.
Area:Portland OR. Wife's parents live nearby.
For our area, we have decent rent. $800 is a bit expensive, and when looking at this from a purely financial standpoint we should find a cheaper place. Unfortunately if we move our transportation costs go up exponentially. My wife walks to work and uses free public transportation to go to school. She also doesn't have a license and there's no parking by her work unless we pay.

OK. Let's add it up: Monthy income: $1400 including food assistance. Monthly expenses: $1934 assuming the $220 food assistance is equal to the food expenditure. Debt: not specified.

Let's focus on the spending first, since I see a dangerously carefree mentality that could lead to problems down the road. If your expenses are greater than your income, it is AN EMERGENCY!!! That means everything goes out the window until you are back on track. For example, a $60 per month gym membership would be a decadent luxury even at my level of wealth. That's why I work out at home. For a struggling person, even if you use your gym 7 days a week and steal free rolls of toilet paper, it's more than you can afford. Pick up some cement blocks and an old rope from an alley and tie them around your shoulders, then start running the many steps of Portland during the rainy nights. Do concentration curls off of the concrete railing of the waterfall bridge as you look to the sky and bellow out your determination to get rich. Rocky Balboa Style.

You aren't rich enough to afford a car yet. Unfortunately, you bought one when you also couldn't afford it (hence the loan). Since the lien on the title might prevent you from selling it until you pay it off, I'd at least take it off the road to save the insurance money, and pay off the unfortunate loan as soon as you can.

If your family will let you move back into a basement, do it – and pay them a few hundred of rent if they need the cash.

Drop the cell phone plans and use prepaid phones and voice-over-internet like Google Voice when at home.

I also notice the debt payments sound very high, at $223 per month. At 5% interest, this monthly payment would service the interest payments on $53,520 of debt. If your debt is just a few grand on high-interest credit cards, see if you can get a family member to pay them off for you, then you responsibly pay the family member back ASAP with 5-6% interest.

It should go without saying that you will never carry even a $1 riding balance on the credit card for the rest of your life, and if you don't think you can achieve this, just cancel the credit cards and never hold them again until you're ready. Credit card interest rates, unless they are below 6%, are predatory and thus should never be paid.

Now that the mandatory tough talk on spending and debt is out of the way, we can move on to income. This reader sounds like a smart and capable guy, being a lifehacker and MMM reader, as well as having a high school diploma and some University education. So he needs to put the brain to work.

I'd advise him to avoid minimum wage jobs if at all possible, just because they suck up much of your time for very little reward. Instead, he could check out the Jobs section of the Portland Craigslist. Focus on things demanding as much, or slightly more, skill than you currently have. In computer or office work, or even in skilled trade construction. Then make up for any skill shortage with incredible professionalism and responsiveness with the prospective employer. Despite what they state in the job postings, every hiring manager or company owner is not hiring a *collection of skills,* but rather a *person to solve their business problems*.

I have hired people from Craigslist in the past myself, and I find that 90% or more of the responses are messy or disorganized or represent an incorrect understanding of my request. Your job is to beat out the first 90% of your competition with a fantastic, instantaneous response to the employer with good grammar and meticulous attention to the detail of their posting. If you do this for 50 job postings a day, I bet you'll have a job at least doubling minimum wage within a month. Hopefully much more. You can also check other online job postings like Monsterboard and network with everyone you know who currently has a good job, to try to ride in on their coattails.

As a retired man, I admit I am a little rusty at getting jobs, but during my working years it was always one of my favorite parts of our wonderful capitalist economy. It's like an exciting hunt, or an elaborate courtship dance, getting your prospective employer excited about how well you can solve their problems and take a load off their mind. I remember the thrill of each interview, and the feeling of that magic moment about halfway through the chat when you could sense the employer decides they want to hire you. At this moment, the conversation shifts from "are you good enough to work for my company?", to "here's how great my company will be to you, if you would be so generous as to come and work for us". I am far from being the world's most desirable employee, but yet this attitude towards interviews has helped me get every single job I have ever interviewed for! (For the record, I've had 15 job interviews and 15 offers in my life, and I have accepted and worked 10 of those jobs. I still miss the thrill of this hunt and may return to the job world someday if a meaningful opportunity arises and I ever run out of stuff to do in retirement. Unfortunately, I'm busier than ever at six years into it, so jobs will have to wait).

I'd like to wish my Portland friend the best of luck in getting out of the little financial gutter he's in right now, and if any of YOU have advice for saving more money or winning in the current job market, share it with him in the comments!

Why are you named, “Mr. Money Mustache”, anyway?

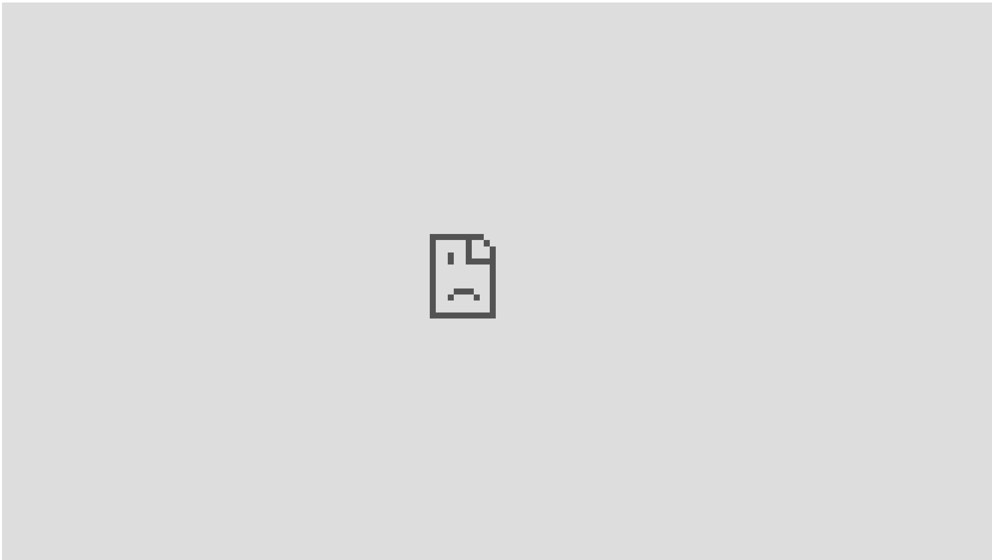
By Mr. Money Mustache

Wed, 31 Aug 2011 12:04:44 +0000

Let’s take a break from all the serious financial analysis for today and cover a more important topic. The name. A friend recently asked me where this silly name came from, and I realized that indeed, I have failed to explain it to you. I am amazed at your dedication to this blog even while such a vacuum of information existed. So let me explain.

I have always thought of the Mustache as a mark of seniority and old-fashioned manliness. Not the little silly mustaches you see sometimes, of course, but the big, bushy type that embarks upon some sort of adventure when it reaches the ends of the upper lip. A Senior Level Mustache might hang off both sides of the face, or it might zoom out into big crazy points or curls, or it might just bend around the mouth and continue straight downwards for as long as possible.

I’m not alone in this respect for the ‘Stache, as any number of videos like this illustrate:



When I was in fifth grade, I had this great teacher who had a black handlebar mustache. Good ol' Mr. Sorge. He was my first male teacher.. scary and strict if you made him mad, but also hilarious and a great motivator. My handwriting to this day is still a copy of Mr. Sorge's writing – a scratchy and compact font done entirely in capitals.

Then in the early years of high school, there was this teacher named Mr. Vail. He had a sideways-protruding mustache with lofty tips that could be seen even when he was facing away from you. He was also highly inspirational, making even advanced math classes very fun and humorous. That helped me enjoy math enough to become an engineer.

So when I think of an old-school Mustache wearer, I imagine this senior gentleman, perhaps a hybrid of Sorge and Vail and a bunch of other tough guys and bankers from old Western movies, walking down a prosperous street in New York City in the 1800s. The ladies have their eye on him, the dudes get out of his way in respect, and the mayor respectfully checks with him on issues of town policy. Now we're up to the level of Mr. Mustache.

Then when you extend the concept to Mr. Money Mustache, you imagine the same respectable guy, but with the added dimension of Financial Acumen. The top businesspeople and bankers ask his advice and invite him to meetings. Hardworking working class men and ladies come to him on the street to ask for advice on their family finances. Children run up to him and he swirls them around so their feet puff through the piles of autumn leaves, then he teaches them a few good jokes or perhaps a magic trick, and as he turns to leave he flips a few golden coins off the tip of his thumb, which land in each of their outstretched palms.. "Invest it wisely, children, and you can grow to be Mustachians as well!"

With a heroic character like that, AND the added bonus that Mr. Money Mustache has all those nice 'M's, and you can abbreviate it to MMM or Triple M, and you can use 'Stash to mix the meaning of Mustache and a Stash of money, AND the fact that 'Stash rhymes with Cash. It just seemed like a fuckin' perfect name… so perfect that it is miraculous that it even appeared in my head. In fact, it might even be that the name forced me to write the blog, just because I didn't want it to go to waste.

So, yeah, that's what I was thinking. Hopefully everything makes a little more sense now.

What is Thermal Mass and How can it Make you Money?

By Mr. Money Mustache

Thu, 01 Sep 2011 11:52:13 +0000

 Air Conditioning Article, but things have changed quite a bit since then for residents of Canada and the Northern half of the US.

Back on July 18th, we were mired in the hottest weeks of the year, when day and night temperatures were both uncomfortably hot, especially out

East.. In this situation, it's hard to take advantage of temperature swings between day and night to keep your house cool and I received many complaints to that effect in the comments ;-)

But now September is here, and the amount of daylight is shrinking at its fastest rate of the year – we lose well over 2 minutes worth per day in September where I live at 40 degrees latitude. And the nights in autumn are much cooler, even while the days are still rather hot. For example, yesterday morning it was 57F(13.9C) outside while I was eating breakfast, yet over 98F(37C) at 3:00PM when I biked out to pick up the lad from Kindergarten. Large swings like this make it very easy to cherry pick the perfect temperature for home comfort by sucking in air at the right time of day. I stored up a whole load of chilliness during the night, so I had no idea how hot it was outside at 3PM until I opened the door… all without touching the air conditioning.

But how much coolness can you store in your house? Is it just dependent on the amount of air that is contained therein? Why do some houses stay cooler than others on summer days? Why do even large tents heat up almost instantly, but even small caves or basements stay cool year-round?

The answer lies in the title of this article: Thermal Mass. We can learn about it right now, because it's always fun to have a **science lesson**, and also because understanding this simple concept will save you money and energy for the rest of your life. So check this out:

Say you're sitting in your living room right now. It's a fairly big room: 15 x 15 feet, with a 9 foot ceiling. Here are a few interesting facts about it:

How much air is in the room? 15 x 15 x 9 = **2025 cubic feet**.
How much does that air weigh? 2025 x 0.0807 pounds per cubic foot = **163 pounds**.
How much energy does it take to heat that air from 60 to 80 degrees Fahrenheit? 0.018 BTUs per cubic foot per degree x 20 degrees x 2025 cubic feet = **729 BTUs**.

Uh-oh, what's a BTU? That's something you should know, since you'll see that term on every air conditioner, barbecue, water heater, and furnace you'll ever own. It stands for British Thermal Unit, and it's the amount of heat needed to warm one pound of water by one degree Fahrenheit. So, if you have a 16oz mug of coffee, which contains about a pound of water, and you need to raise it from a chilly room temperature (60F) to boiling temperature (212F), you'll need 152BTU of heat.

So let's go back to your large living room. We know it will take 729 BTU of heat to warm the air in that room up from 60 to 80 F. But we just pumped 152 into your coffee. Does that mean we could warm up the whole room just by setting about 5 cups of coffee out on the floor?

Intuition tells us that would not be enough heat. And intuition would be right. The reason it takes much more than a few Coffees worth of heat to warm up a room is the **THERMAL MASS** of the actual structure of the room and everything in it.

As it turns out, that room also has 765 square feet of drywall on the walls (which weigh 1224 lbs), 225 square feet of hardwood flooring (482 pounds), and a few pieces of furniture (400 pounds). Briefly ignoring that each material stores a different amount of heat per pound, we can still see that the room itself weighs 2100 pounds, drastically more than the 160 pounds that the air weighs. So to warm up that room, you'll need not just five cups of boiling water, but somewhere north of Fifty of them.

Now you can see why a typical house can stay comfortable for at least the first few hours of a hot autumn day, even while a tent of equal size would start to sizzle within just a few minutes of sunlight exposure.

And the scientifically inclined might be starting to get some ideas about how to use this knowledge to save energy.

In a modern 2000 square foot US suburb-style house, there is about 20,000 pounds of drywall on the walls and ceilings. Since this suburban house has mostly carpeted floors (carpet has minimal thermal mass and acts like an insulator), the drywall represents about 90 percent of the usable thermal mass of the house. A house like this has a moderately stable temperature, but when you add a few humans and some sunlight, it will still warm up to uncomfortable temperatures during the course of a day, even if it starts out at 65F in the morning.

My house had similar construction when I bought it in 2006. But over time, as the carpets have worn out, I've replaced them with natural wood and tile floors. Not only do these add some useful thermal mass, they also bridge the heat into the underlying subfloor and framing better than carpet, furthering the effect. I have also rebuilt several bathrooms with an extensive amount of tiles and luxurious solid poured-concrete-under-mosaic-tile shower floors. . And I'm working on making the house even heavier, eventually planning to form some thick concrete countertops when I renovate the kitchen, and even create a solid earth, stone, or concrete wall in the South-facing room which will capture immense amounts of solar energy on winter days.

So let's put this all into practical application: My house now has about 15,000 pounds more usable thermal mass than it did when I moved in. With a few engineering tables I can see that amount of material, in my proportion of tile, stone and wood, will suck up about 5,000 BTU of heat for each degree the temperature in the house rises.

On a cool night when I run an outward-blowing fan, I can get the house down to 65F. The temperature at which my house becomes a bit uncomfortably warm is 82F. So we have a temperature swing of 17F.

During this 17 Fahrenheit heat-up on a hot sunny day, all of those 15,000 pounds of materials are fighting the temperature increase, sucking up the heat, and keeping me cool. By the time the interior temperature DOES finally reach 82F, they have absorbed 5,000 x 17 = 85,000 BTU of heat.

As I mentioned in an earlier article, my central air conditioning system can pump 36,000 BTU of heat per hour out of the house.

The new materials I have added are sucking up an equal amount of heat to running the air conditioner for almost two and a half hours each day! If I relied on air conditioning to replace what I get for free with this nice cooling feature, I'd be burning an extra 210kWh of electricity per month, almost doubling my bill.

Note that while the thermal mass does suck up heat, you still have to get it back out each night so it can repeat the process the next day – that makes the open windows and the cooling fan even more important.

This rough engineering calculation (which I had never done in detail before writing this article) nicely backs up my anecdotal experience with these renovations: When we first moved into this house, we felt the need to turn on the A/C for a couple hours each afternoon, despite my best efforts at night cooling. Once I had eliminated all the ugly carpet and fixed up the bathrooms, the need for A/C was gone!

Of course, I didn't spend hundreds of hours installing wood, stone, and tiles just to save electricity. The primary reason was the desire to have a nice comfortable house with stylish natural materials inside. But the practical lesson is the same – when renovating for comfort, think HEAVY. When shopping for a house, if you have the option, keep an eye out for concrete floors, or interior stone or brick walls, and South-Facing windows if you live somewhere with cold winters. And if you really want to get the Mustachian Scientist award, you can make a point of putting heavy things into your house just for the temperature stability they add. A treasure chest full of gold? A large fish tank? A Medieval stone table and chair set? I'll let your own creativity take the reins on this one.

In the winter, the same effect happens in reverse. Before thermal mass, my house would heat up to shorts-and-tanktop temperature from the relentless horizontal sunshine on winter days, then lose heat quickly at night. Now it stays at a more constant temperature. As I add more south-facing windows, I will add more weight, focusing on heavy but environmentally cheaper materials like reused tile, locally sourced stone or even a wall filled with crushed gravel. True eco-homes have concrete floors and even giant tubes of water in front of their solar gain windows. A few hundred gallons of water can store enough heat to get through an entire winter night, even while it costs only a dollar or two when poured from a tap. And it looks quite neat.

I'm just getting started on my Energy Independent House project. I'm sure some of you are years ahead of me on this, soaking up free sunlight,selling solar power back into the grid, and watering your vegetable gardens with house drainage. But it’s a very fun hobby for me to grow into nonetheless.

Book Review: "Enough." by John C. Bogle

By Mr. Money Mustache

Mon, 05 Sep 2011 04:16:39 +0000

 interesting video clip on YouTube with this wise old guy dishing out some very humble and sensible lessons for living a meaningful life. As I watched, I came to realize the guy talking was John Bogle, the founder of the Vanguard Group, a place that has been leading the world in high-quality mutual funds since 1976 (and taking care of my own investments for about a third of that time!)

In the video, John was discussing his new book, which is called "Enough." The founding premise of this book was an actual conversation that occurred many years ago. Two famous authors, Kurt Vonnegut and Joseph Heller are talking at a party hosted by a billionaire hedge fund manager. Kurt says to Joseph, "You know, this billionaire makes more money in one day than you made in your whole lifetime from your novel *Catch-22*". Joe responds, "Yes, but I have something he will never have… *enough*."

That sounded like an interesting idea for a book, coming from a lifetime CEO of a company that manages well over a trillion dollars of the world's dough invested in the stock market. So I checked it out of the library.

As I read the book, I learned the whole history of John C. Bogle, and I came to appreciate why he has a worldwide following of dedicated fans. He's one of those rare low-key rich people that deliberately collects and spends only a tiny fraction of the earnings of most in his position, and puts most of his efforts into encouraging better results, through investment, for Vanguard's customers, its employees, and for society as a whole.

Despite the fact that this guy knows the financial system better than almost anyone, he openly admits that "rampant greed threatens to overwhelm our financial system – greed which runs deeper than money. Not knowing what *enough* is subverts our professional values. It makes salespeople of those who should be fiduciaries and turns a system built on trust into one built on counting".

The concept of Enough rings true to even little old Mr. Money Mustache. I can see that at a certain point of wealth, it becomes increasingly foolish to earn and spend any more on yourself. If you pay close attention, you will find you have *Enough* much earlier than you thought was possible. After this, you're much better off turning your efforts to something more creative and generous. When people ignore this advice in massive numbers, they do it at the peril of themselves and their society.

The introduction is probably the most useful part of the book, followed by the titles of the chapters:
1: Too Much Cost, Not Enough Value.
2: Too Much Speculation, Not Enough Investment.
3: Too Much Complexity, Not Enough Simplicity.
4: Too Much Counting, Not Enough Trust.
5: Too Much Business Conduct, Not Enough Professional Conduct.
6: Too Much Salesmanship, Not Enough Stewardship.
7: Too Much Management, Not Enough Leadership.
8: Too Much Focus on Things, Not Enough Focus On Commitment.
9: Too Many Twenty-First-Century Values, Not Enough Eighteenth Century Values.
10: Too Much "Success", Not Enough Character.

The most interesting insight to me in the remainder of the book was in Chapter 9 about the 18th century values. Bogle points out the incredible spirit of community-mindedness that was present in the leaders of the time – many of them being the founding fathers of the United States itself. Benjamin Franklin was the ultimate example, spending his life inventing cool things and starting useful groups, and then sharing them with society just for fun.

Franklin believed that “Knowledge is not the personal property of its discoverer, but the common property of all. As we enjoy great advantages from the inventions of others, we should be glad of an opportunity to serve others by any invention of ours, and this we should do freely and generously.”

To this I say, “Fuck Yeah!”. To those who would question the spirit behind Franklin’s words as being too liberal-minded and not capitalist enough, I would say, “Uh-huh, and which of the world’s economic powerhouse countries did YOU help to found recently?”

I think that whether you *think* you are liberal or conservative, you will still become richer by practicing less greed and thinking of a much larger and longer-term picture. This works on both the individual level and the country-wide level.

Unfortunately for John C. Bogle, despite being a hero to many and a great contributor to society, he is not a particularly concise or exciting writer. So I found myself yawning through about 200 of the 276 pages, even as I sleepily agreed with everything he said.

So if you just want the executive summary, I would say it is this: “Being a rich person doesn’t mean you have to be a big evil douche. But among the rich today, we do have a lot of this unfortunate breed. So we need to reward and encourage the good ones, even while carefully regulating a few walls around the worst offenders – otherwise get yourself ready for a neverending series of 2008-style Great Financial Crashes where great profits are made in the booms, and the governments (i.e. you and I) are forced to foot the bill during the frequent crashes.”

Thanks John C. Bogle for leading a good life and telling it like it is.

How much is that bitch costin' ya?

By Mr. Money Mustache

Tue, 06 Sep 2011 14:41:57 +0000

Wow, how about that title. I can almost smell the politically correct outrage! But let's explain right away, lest Mr. Money Mustache lose his rep as a caring family man who spends most of his time making sand castles and Lego ships with a 5-year-old boy.

The alternate title was "Fix Impulse spending with The Frugality Sanity Check". I just made this upgrade at the last minute because Mr. Money Mustache likes a dramatic title.

By "Bitch", I am of course referring to either your male or female spouse/partner, or to YOU YOURSELF if you are single. Here we're talking about the person inside all of us that is drawn into making unplanned purchases.

Neither males nor females have any monopoly on impulse spending. But for many months, I have received calls for advice from readers and locals alike, asking things like this: "Dear MMM. I am a proud Mustachian myself, but my spouse feels differently. Every day I come home from work to find a couple more Target bags on the couch with stuff spilling out of them". Or hair salon and martini bar charges on the credit card. Or jet skis and ATVs multiplying on the trailer behind the six-wheeled F-350 Super Duty.

How can you convince a spouse to become more frugal? That's a tricky one, since money spending often gets accidentally mixed right into people's sense of personal worth right from childhood. Perhaps it is because we've been a rich country for so long that it's hard to tell where a person ends and their products begin.

It's hard, but let's have a crack at it anyway. You can start by making sure that you and your partner have the same goals in life. If your goal is "Kickass early retirement, Just like Mr. Money Mustache", and your spouse's goal is, "I dunno, just lead a good life as long as I don't lose my car to the repo man", you're obviously not going to be able to solve your money problems through old-fashioned arguing alone. You need to find a common goal, as suggested in the old classsic "Having The Talk" MMM article.

Some people have no particular money goals at all, and others have goals but don't understand how to get to them. I think most peoples' financial goals are far too feeble, stuff like "Pay off my $20,000 student loan over the next ten years". The key to bold and successful goals is understanding just how great the numbers become if you really have control of your spending. Over a decade, most people have the ability to amass not just hundreds or thousands of dollars, but *hundreds of thousands of dollars*. That is early retirement, change-your-life money, and it is worth changing your lifestyle now, for the opportunity to really change your life in the near future.

OK, so now you have a common goal. Hopefully it's "Full Financial Independence within the next ten years", but even if it is something modest like "Get our student loans paid off by 2014", we can still roll with it.

The quickest way to reach your goal is by eliminating all wasteful spending. Rent or mortgage, and groceries are your non-wasteful spending (as long as you practice some variation of Grocery Shopping with your Middle Finger). Everything else will come under close scrutiny, since it might be wasteful!

How do you determine if something's worthwhile or wasteful? You ask your partner! Check out my highly controversial yet effective way for domestic spending harmony. It is so controversial, even Mrs. Money Mustache had to add a few qualifications before accepting it.

For any non-grocery purchase above 10 bucks, check with your spouse first.

That's right, baby. No "personal spending budgets" or spousal expense accounts. Those concepts assume that you're buying so much stuff that you don't even have time to check on things one at a time. What I want you to do is start having Buy Nothing Day become a regular occurrence, and days where you buy things become special exceptions. Remember, you already have lots of stuff, so it's questionable as to whether you need any more. And, A Millionaire is made Ten Bucks at a Time. So let's learn more with some examples.

Just this week, my 1999 Melitta espresso machine died. It was an old steam-powered model that had cost $25 on sale brand new back in the day, and made shockingly good lattes for 12 years. But something serious cracked in its pressure tank, and it can no longer produce the Black Gold for us each morning.

I started by trying to clean and fix it. No luck. I checked on Craigslist to see if any of my fellow Longmontians were unloading one for $10 or so. No luck there either – only way down in Denver, a distance I would not drive just for a coffee machine. Today I made the morning coffee in the french press from our camping kit. It was still coffee, but compared to my patented Triple M Homemade Lattes, it sucked.

So I checked with the wife. "Should we buy a new espresso machine? Or should we just stop drinking coffee, since that is a costly habit anyway?

She said, "Come on, Money baby. You know we love our lattes! We're retired, we can afford a new machine!".

Permission granted. We checked together on Amazon and found one with hundreds of good reviews for about $45. We put it in the cart and decided to sleep on it.

Today I biked down to Target and had a look there as a final check. The same unit was available for $40. I bought it and threw it into the bike trailer. I brought it home and we cooked up a batch this afternoon. It made a couple of delicious lattes right out of the box, which are now powering my fingers even as I type this.

But wait, you say, that's an easy example, because we both agreed. But what if your spouse *disagrees*?

The answer to that is actually even easier. If you want to buy something, and your spouse decides to override your purchase, **you accept the decision with great humility, respect, and gratitude**. This person has just saved you a pile of money and brought your financial independence even closer! And it was obviously something you didn't need, because they would have seen your need objectively if it was real. This is the person you love*. Respect their opinions.

Check out this counter-example. I have a high definition video projector in the basement. We've been using it for the past 5 years to watch our movies on an 11-foot screen (it cost me about $800 back in 2006, in case you were curious). That's right, we watch movies in style. But it's a bit awkward to get the movies started, because the projector is fed by a computer on the other side of the room. I have to start the movie, set it to full-screen, then run across and hop under the blanket to watch the movie. If there's a problem, like unexpected subtitles or the wrong aspect ratio, I have to run back and forth to make corrections. The family gets upset with me when I do this.

So I've been fantasizing about getting a long-range wireless keyboard with a built-in trackpad, like this one for $30. Then I could start and stop movies and do all the fiddling from the couch.

"Can I buy that wireless keyboard?", I asked Mrs. M today, during a consumer high fresh off of purchasing the espresso machine. "No, that's silly", she said, "We only watch one or two movies a week – and our setup is already pretty sweet as it is down there, just leave it as it is."

Of course, I could choose to feel upset over this, or I could ignore her advice and buy it anyway. But instead I like to look at a challenge like this as a Frugality Muscle Workout.

When I'm lifting weights, and a workout partner challenges me to throw an extra plate onto the bar or do another rep at the end of a grueling set of bench presses, I don't whine and start looking up divorce lawyers. I am thankful to this person for having the guts to call out my wimpiness and I accept the challenge, knowing it will make me even stronger! My pectorals and triceps might feel like burning slabs of lava at that moment, but it is the best pain in the world and the reward of increased muscularity and health is even better!**.

You absolutely MUST realize that Not Buying Things is exactly like healthy exercise – it is not a deprivation or a decrease in your life quality – it is almost always an increase.. especially if you are not yet retired and the monetary reward is factored in. That's why I still do these workouts even from my position of retirement – it really does make you happier to be more thoughtful about your consumption spending.

So there's my solution to the Expensive Bitch in your life – get him or her onto your team, so you can stop fighting and start 'Stashing!

Extra Credit: The article was inspired in part by the following Onion link from a wise triple M reader – thanks Mr. Frugal Toque!

Consumers Now Required To Seek Treasury Department Approval On All Purchases Over $50

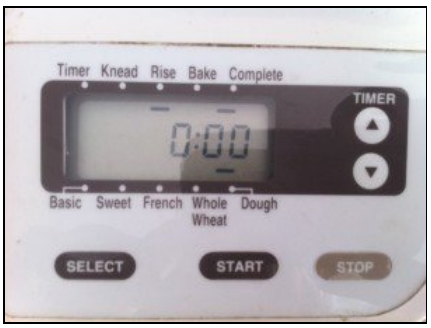
* **"This is the person you Love"**.. but who do you ask for Purchasing Permission if you are single? Well, you can ask Me, Mr. Money Mustache, or your fellow Mustachian Readers right here in the forum. Because We love you too.

** Note: this paragraph should be read in an Arnold voice for maximum effectiveness.

My $750 Bread Making Machine

By Mr. Money Mustache

Thu, 08 Sep 2011 12:26:57 +0000



Some consumer products become the butt of many jokes, because they are often bought in a fit of good intentions, but then discarded almost immediately. Treadmills and exercise bikes are in this category, as are juice extractors and bread machines.

So you can understand the hesitation I felt three years ago, when the temptation to own a bread machine of my own started growing within me.

The justification in my mind was that we were eating a lot of bread at the time, and hey, who doesn't like fresh bread?

So I let the idea sit and rise for a while, and meanwhile the Mrs. and I went over to dinner at the home of some friends one night. These friends are a sophisticated and frugal couple from Holland who had just moved to the US.

They served us an exotic spicy vegetarian meal that was insanely delicious, with a slice of steaming seed-encrusted fresh-baked bread on the side. "Damn!", my wife and I said, "We need to start eating more like you two!". The table immediately broke into two discussions – the ladies debated the merits of various vegetarian recipes, and the men went to the garage to learn about this whole bread machine deal.

What I learned is that a bread machine is not necessarily a failed consumer product to be scoffed at. In the right hands, it is an instrument of Supreme Frugal Gourmetitude. “You just throw in some flour and a few other things”, explained my European friend, “and you have a great loaf of bread in just a few hours. Since you eat the bread each day, you are forced to make more several times per week. There is no chance of not using the machine regularly, so I do not understand why these machines are often abandoned in the United States.”

I love how Dutch people explain things, by the way. It is as if in their country, logic and reason are actually practiced by a majority of the population. (?!). When you add the cool accent, you have a very persuasive group of people.

With this new endorsement from a logical person, I had a peek on Craigslist. Sure enough, there were dozens of almost-new bread machines out there. I was able to find one right in my own town, at a price of $10 (the original value of this particular machine was around $100).

Three years into ownership, I must say that this machine is still a huge hit. First of all, the cost savings are significant: to buy a good-quality loaf of whole wheat bread in the grocery store costs about $2.50. To put in flour, yeast, olive oil, water, salt and sugar costs me about 50 cents to get an equivalent sized loaf of bread, with flour purchased in 50-pound bags from Costco. The time investment is also miniscule – without any special preparation, I timed myself in measuring the ingredients into the machine and pressing ‘START’ last time I made bread: 90 seconds. If you factor in the time needed to walk to the bread section of your store and pick out loaves during regular grocery shopping, the net time cost might even be zero. Plus I prevent a plastic bag from being manufactured as well.

So I’ve been saving two bucks per loaf, two loaves per week, for about 3 years. That’s $600 in bread money that is now part of the ‘Stash. Plus the bread is much more delicious, and you can even get crazy and make fancy bread – at various times I have made more decadent types such as my “Beer, Cheese, Bacon and Olive” bread. That stuff is baad~asss. You can throw in flax seeds, sesame seeds, even random crickets and ants from your back yard if you want to get really International/African with your recipes. Olive Ant Bread. Could be quite interesting.

BUT WAIT!! There is an even more exciting contribution this $10 machine has made to my life. It has completely eliminated the temptation to order pizza. Nowadays, I make the pizza dough in the machine, and roll it out into enormous thin-crust sheets which I bury in gourmet ingredients. It is just ridiculously delicious. I also make little personal 8″ pizza crusts by the dozen and freeze them. These are whipped out every afternoon and made into near-instant pizzas as lunch or after-school snacks for my little son. If you have a party at your house where pizza is in demand, you roll out some big fancy crusts and let the guests create their own edible works of art. It is a highly sociable alternative to ordering pizza that improves upon the experience in every way.

It's hard to estimate how much cash this machine has saved me. At a minimum, it would be $600 in bread plus a a random allocation of $150 for pizza savings: **$750**. More realistically, we used to order pizza at least once a month at about $20 including tax, tip, and delivery. Nowadays, the raw ingredients cost $6 for a giant pizza. 3 years x 12 pizzas x $14 in savings per pizza is actually $504 worth of pizza, making this machine worth a total of **over a grand** so far. Regardless of the actual numbers, I am a happy Mustachian.

When it boils down to it, a bread maker is just another motorized consumer product that a true minimalist would scoff at. But in my own odd life which combines both frugality and decadence, I have found this device to be quite a worthy contributor to the family. If you eat bread and/or pizza regularly, I can safely recommend having a peek at your local Craig's if you want to dip a toe into the breadmaking world as well.

*** Bonus Epilogue Section! ***
This article ended up gathering an unexpected number of views and comments. I figured I should update it with the following useful tips to make it more useful:

Once you get your machine, you will be excited to try it out right away, as I was. I walked into my standard grocery store (Safeway or Kroger) and picked up some whole wheat flour and breadmaking yeast. But when I did the math on the per-loaf cost, I was spending almost as much as the commercial bread! Why was this?

It's because these ingredients vary widely in price. In the grocery store, they try to sell tiny 4 ounce jars of bread making yeast for $5.29 or so. In Costco/Sam's club, you can get a 32-ounce double bag for a this price – maybe even less! Similarly, my local Safeway grocery store likes to display boutiquey-looking 3-5lb whole wheat flour in small bags for $5 bucks.. while Sam's club was selling 50-pound bags of whole wheat for $15 or so when I last visited. Even Kroger (known in Colorado as "King Sooper's"), sometimes has their store brand whole wheat flour for $1.79 per 5-lb bag. Since this ingredient can be stored forever, just stock up to infinity when you see it at this price.

The other ingredients (sugar, salt, oil, assorted seeds and grains) are fairly low cost at any store, but Costco still rules.

Update – almost two years later: Although Mrs. MM and I no longer eat wheat these days (she became gluten intolerant and we both moved to more of a Mark's Daily Apple style of low-carb eating), this bread machine still gets used regularly. My son still requires fresh-made Dad's pizza, and we make the odd loaf of gluten-free bread whenever we need the magical weight-gaining properties that bread seems to provide for us.

Mrs. Money Mustache: What do newborn babies really need?

Eliminating Lady Temptations: Avoid the Urge to Buy for Baby
by Mrs. Money Mustache

Congratulations! You're having a baby!

Ah, babies… so small, so cute, so sweet, so…. expensive? Why is there a common misconception that having a baby costs a ton? How much does it really cost? **Answer:** not much.

Yet, us ladies just love to shop for babies. We must prepare. We are nesting. We're not ready for the baby to come yet! The room decals we ordered have not arrived, the special nursing glider is not assembled, the room hasn't been painted with fancy pink stripes… what will the baby think? Why do we spend more time thinking about buying and decorating (supposedly for the baby) rather than the actual task at hand: preparing for labor?

For you second, third, or fourth+ time moms, stop reading right now. You don't need anything. No arguments — nothing.

If this is your first baby, you're mostly going to have to get mentally prepared. That is the hard part. The actual objects you need for said baby are pretty minimal.

So, what did we do? I am the type of person that researches everything, so naturally, I researched the matter. What I found is that the Internet, my friends, and those scary things known as baby shower lists, grossly exaggerated what was needed. First of all, it's quite possible that you might have friends who have young children themselves. They might already have enough hand-me-downs to take you through the whole first year. I'm sure it's easy to spend $0 on your baby. Perhaps it's even possible to spend negative dollars!

Challenge Idea: if you do need to make a few purchases for an upcoming baby, try getting it from friends and from various used sources. And then sell some extra stuff you have lying around your house for the same amount of money. Voila! Zero dollar baby.

Here's what your newborn baby needs:

1. Diapers

Sadly, babies are not born knowing how to use the toilet. So we choose between cloth or disposable diapers. (Side Note: Look up Elimination Communication or check out http://www.diaperfreebaby.org/ if you're really advanced). For us, using cloth was a no-brainer. I spent hours researching cloth diapers and it seemed confusing at first, but it is actually extremely easy. People complain that it is complicated, that they have to wash them, that they leak, that it's gross… get over it! You're going to get shit on your hands either way. Once you find the right kind of diapers, it's easy …

The Mrs. Recommends: Get a variety of cloth diapers for age 0-6 months. This helps you figure out what kind you like. Don't get sucked up in the cuteness of cloth! You can spend a ton. Keep it simple, be successful. I purchased: 10 prefold diapers, 6 “Kissaluvs” contour diapers, about 4 covers for all these, 1 “Fuzzi Bunz” pocket diaper, 1 all in one diaper, and a couple of others. TIP: Prefolds work great as burp cloths too.

When your baby hits 6 months, sell the newborn diapers and buy the kind you like for the next stage. The MMM family used 14 Medium Sized Fuzzi Bunz diapers from 5 months until our son was potty trained at just over the age of 2. For overnight accident protection, we used cloth until nighttime toilet training was reached… no pull-ups required!

At that point, we sold the 14 Fuzzi Bunz for half their original price. It was a great investment overall, saving over a thousand dollars in disposables! Look for used cloth diapers, if possible, and re-sell once you’re done with them.

2. A Place to Sleep

When I was born, I slept in a little pink bathtub. Cozy and just the right size. When our son was born, he slept in a fancy co-sleeper attached to our bed. Your baby can also sleep in your bed, as ours ended up doing on most nights. The key, in my opinion, is that the baby is close to you to make nighttime feedings easier and to allow you to get as much sleep as possible. Your newborn baby does not need their own room or a crib, since they are so small. Your baby does not need fancy bedding.

The Mrs. Recommends: If I had to do it over again, I would have skipped the co-sleeper and had the baby sleep in bed with us. But, if that’s not an option for you, I would suggest using a Pack ‘N Play with Bassinet instead of the co-sleeper. After a quick search, the Graco Pack ‘N Play Playard and Bassinet seems to fit the bill. The secret here is that the “Playard” is not for playing — it’s a place for your toddler to sleep on the go, probably up to about age 2. Handy dandy. It’s simple and takes care of your baby’s sleeping needs for quite a long time. You easily can bring it to people’s houses and on trips. Plus, you can probably find one used.

3. Clothing

There is absolutely NO need to buy new clothing for your baby. In all likelihood, you will get tons for free from friends that have already had babies. In our case, we literally received a Subaru Wagonful of clothing for ages 0-6 months. The parents were all too happy to get rid of it. It has since made the rounds to at least 10 other kids. If, for some reason, you don't receive any free clothing, ask for it. If that doesn't work, get some used from a consignment shop or buy bagfuls from craigslist. The point is, it is VERY easy to get used baby items. Our baby lived in footed PJs (he was born in January). I frankly saw no need for any other type of clothing, other than warmer stuff to throw on when we went outside. I'm not talking about a fancy baby winter coat here… I'm talking about blankets and body warmth. Your baby can fit inside your coat and would prefer to be there instead of in a stroller anyway.

The Mrs. Recommends: get all clothing used or from friends. There is no reason to buy a single stitch of new clothing for your baby.

4. A Carseat

If you drive, then it is required that you have a carseat. Most hospitals will check to make sure you have one before they discharge you. Many people will tell you that you need to get a new carseat, and I will not dispute this, as I understand their reasoning. However, we got a free carseat from a reliable friend who told us it had never been in an accident. We used it sparingly for one year and passed it on to another friend. If you're lucky enough to have your baby at home, or you can walk home from the hospital, you probably won't need a carseat at all. We planned to walk home from the hospital, but an unplanned c-section foiled these glorious plans. Have I mentioned that I hate hospitals?

The Mrs. Recommends: get a reliable used carseat from a friend or if you can't find one, buy a basic newborn carseat. Try not to drive around with your baby in the car very much. That's the safest thing you can do for your baby.

5. Breastmilk or Formula

Breastmilk is free – hooray!! If things had turned out like I wanted, I would have breastfed my baby for 2 years. But, alas, due to our circumstances, we had to supplement with formula, so we bought formula and bottles. But, we only bought these things after our baby was born, as we originally didn't expect to need them.

The Mrs. Recommends: Breastfeed your child, but be prepared for some potential struggles. Have resources set up BEFORE you have your baby. A reliable and friendly lactation consultant or contact information for La Leche is a great idea. If there are any problems early on, get help right away.

6. YOU!

Your baby needs you more than anything. If you can swing having at least 1 parent stay at home during the first 6 months of your child's life (preferably longer), you not only save on daycare costs, but you give your child the greatest gift of all.

The Mrs. Recommends: have one (or both!) parents stay at home and save money on all the childcare expenses. Your baby gets YOU and you save money! Win-win.

As a final summary, here's what the MMM family used for our little one from 0-6 months.

- mini co-sleeper (bought new) — this later made the rounds to 10+ kids — baby spent a lot of time in bed with us, so this was not really needed.
  - Cost: $130
- little baby clothes, socks, blankets, assorted small toys (received free second hand from awesome friends) — these also made the rounds — again, we received a lot of clothing and only used a very small amount.
  - Cost: FREE
- car seat (received free from friend) — given to a friend — we did drive occasionally, so this was needed.
  - Cost: FREE

- maya wrap for carrying little one (bought used on craigslist) — sold on craigslist for $30 — we used this until our son was about 2 for walks, hikes, and around the house.
    - Cost: $40, Sold for $30, Net Cost: $10
- about 20 cloth diapers, mostly new — sold for almost same price purchased.
    - Cost: $150, Sold for $150, Net Cost: $0
- boppy pillow (received as gift) — re-gifted — we used this for breastfeeding as well as for lying down and sitting up
    - Cost: GIFT
- bouncy chair (received free from friend) — given to a friend — our baby liked it a lot
    - Cost: FREE
- baby bathtub (received as gift), although you use a small sink or simply bathe with your baby instead
    - Cost: GIFT

Total Cost: $320 – $180 sold = $140.

To be fair, we did end up renting a pump from the hospital and buying formula and a few bottles, but as I mentioned earlier, these were unexpected costs. We also had to pay for the actual birth of the baby, as insurance did not cover all costs. However, since we all have a unique situation and I'm hopeful that your birth and breastfeeding experience is better than mine, it is easier not to factor all of this in. In total, the cost was still minimal compared to what the average family spends. Anything else can be purchased (preferably used) on an as needed basis.

Bonus Challenge: Try and use less than we did. It should be pretty easy.

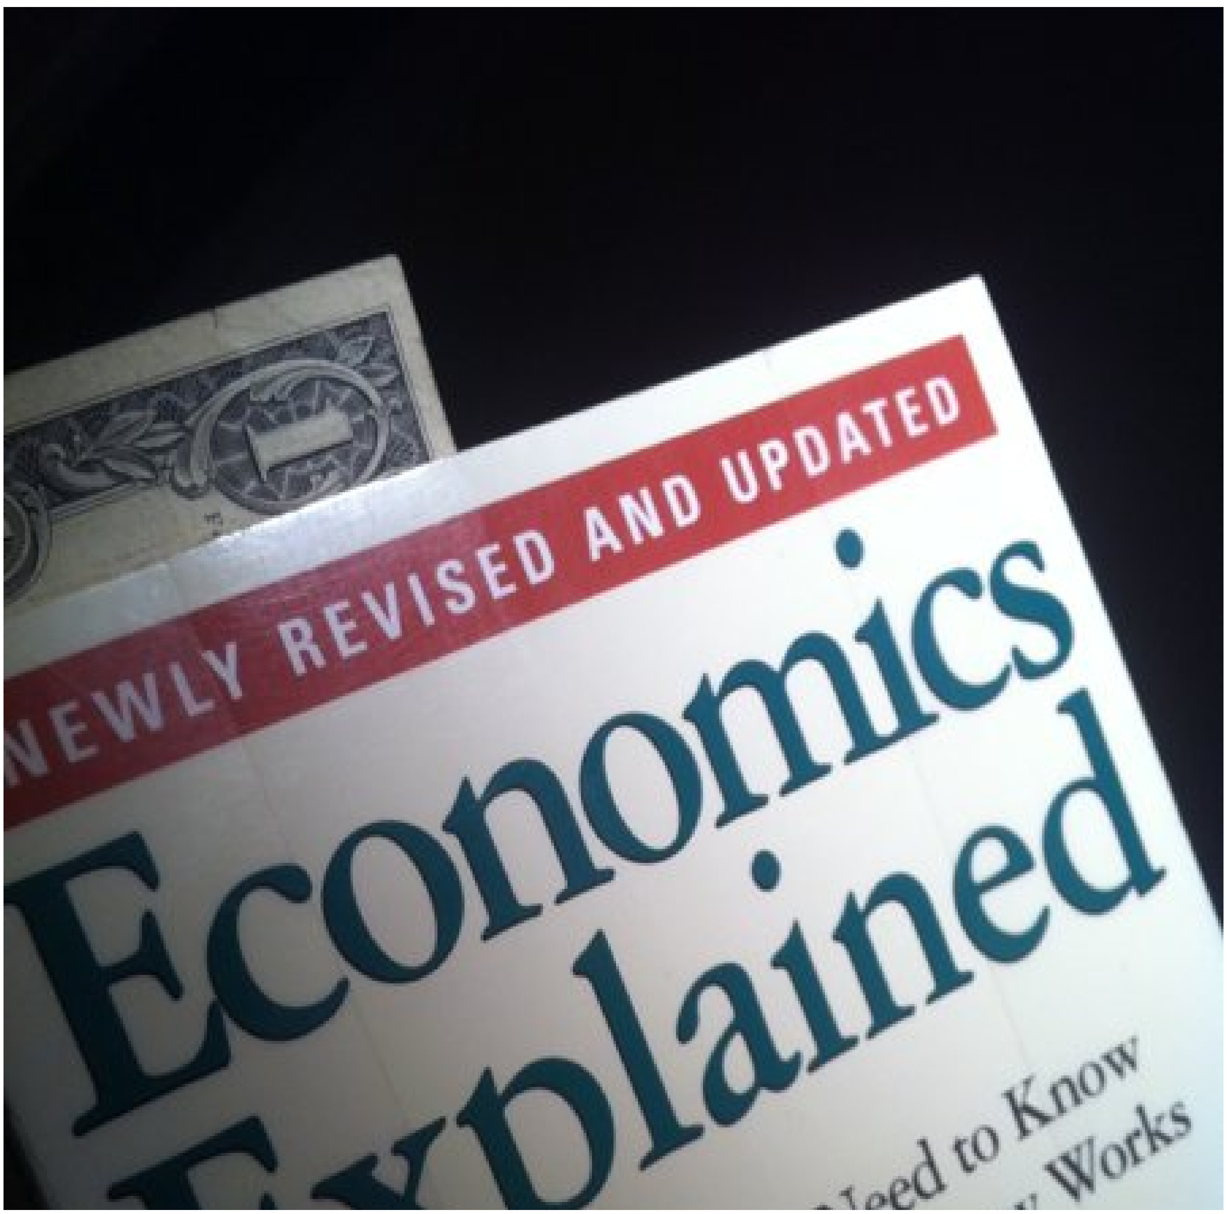
Next time, we'll chat about what babies don't need. Months from now (as my articles are currently fairly sporadic), we might cover cloth diapers in more detail, the ridiculous tradition known as a "baby shower", as well as what the 6 mo to 1 year old crew needs (again, not much).

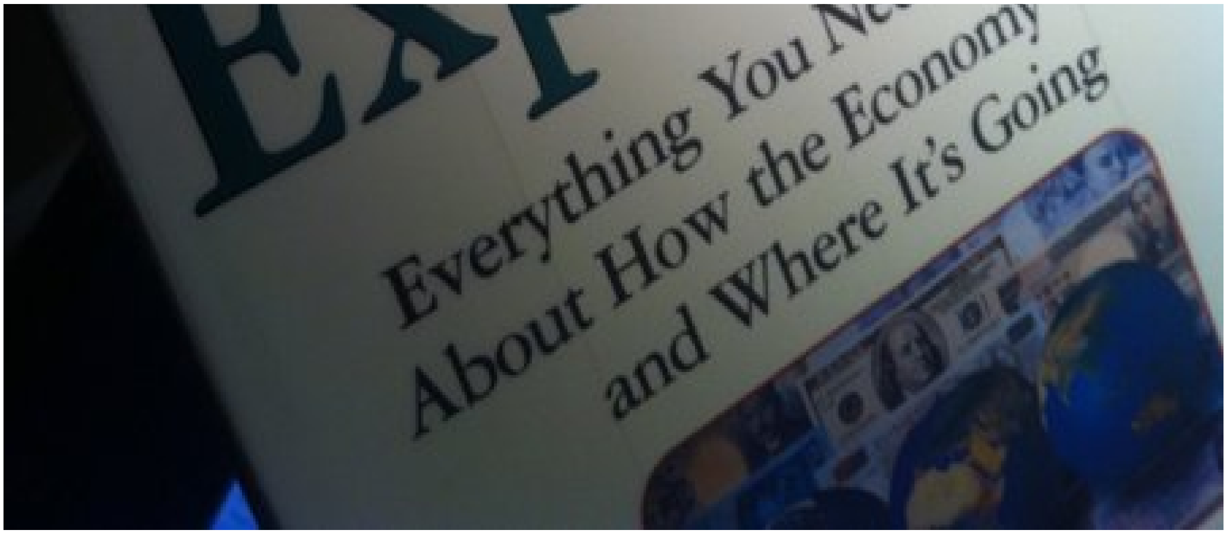
Happy baby-making!

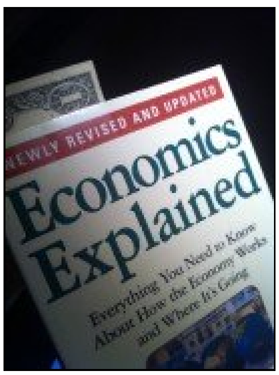
Book Review: Economics Explained

By Mr. Money Mustache

Mon, 12 Sep 2011 12:07:24 +0000







I have an irrational love for the subject of Economics.

This strange love lay dormant in me for my whole childhood and high school career, because I incorrectly assumed I was born to be an Engineer – meaning I assumed that taking optional economics classes in high school would be a distraction.

But in university, one of the compulsory classes was Economics 1A06 with an enthusiastically smiley grey-bearded man named Dr. Martin Dooley. He was a fantastic professor, but even better was this magical subject he was teaching me. **The study of *money!*** I had no idea you could get actual course credits just for learning about such an interesting topic. It was completely the opposite of calculus, a subject irrelevant to any form of modern work, which I had to force-feed into my brain even to obtain a reasonable grade.

So for the entire year of Economics 1A6, I attended every lecture and sat in the front row soaking up the beautiful words. Interest Rates. GDP.

Investing. Debt. Supply and Demand. What the Good Doctor said each day made such perfect sense to me that I didn't even need to open the textbook for the entire year. The weekly assignment questions all seemed just entertaining discussions and I answered them all and wished there had been more. The exams felt like board games and eventually, sadly, the course ended and I looked at my 98% score in the course and wished I could do it all over.

I wish I had realized I had this bizarre attraction and aptitude earlier in life, because I could have reached Early Retirement a few years earlier if I had gotten some sort of business/commerce/finance degree and become a Wall Street Weasel instead of plodding along for almost ten years as a tech-company nerd. But oh well, at least Economics is here for me now, providing poorly-written books on incredibly interesting material for my bedtime reading. Without being forced to, I've read books on both exotic and boring forms of stock market investing, economic history and futuristic predictions, successful and unsuccessful companies, marketing, investors and inventors, and people and company management. They have all had great things to say, but almost all of them could benefit from being put on a 75%-off diet to strip out all the fat of flowery, overly-serious language and repetition. If you're writing something other than a nice exciting novel, you should really be able to make your point in 200 pages or less, don't you think*?

But today, I just finished reading a very *well-written* book on economics. So I thought I'd share it with you. I've been hoping to find a compact all-in-one book on the subject for a while, both to polish up on the basics myself, and to have a good one to recommend to other people who want to go from Zero to Hero on the subject with just one book. In only 228 pages!

When you understand the basics of economics, the modern world is entirely less scary to you. In fact, it becomes somewhat predictable and amusing!

Is the current level of unemployment in the US an amazing and unprecedented hardship as the politicians suggest, or is it just a normal part of the always-exciting business cycle? Is the current level of the national deficit and debt a crushing precursor to the end of capitalism and a return to homesteading with a wary eye and a loaded shotgun? Or just a few trillion pounds of extra fat that need to be worked off? Why have interest rates been at record lows for years now, with at least two more years of them promised, when they were up around 20 percent as recently as the 1980s? Why do the richest people keep getting richer so quickly? Is the Federal Reserve a collection of smart people with an advanced understanding of economic theory and practice, or a bunch of bank-owned bandits that should be fired for corruption?

When you read or watch the news, the politicians on *both sides* universally vastly misstate even the most basic and non-controversial principles of economics, yet the journalists don't bother to correct them or point out their errors. I think it's because the politicians and the reporters don't understand the subject themselves. With one very notable exception of the UK magazine called The Economist.

And oh, the Electorate! The poor non-Mustachian folks of our country have some incredible arguments based on little chunks of information they pick up from television shows and political blogs. They argue on talk shows, and they argue in comment threads after each online newspaper article. And they are often arguing two equally wrong sides of a perhaps-irrelevant economic issue!

But YOU, as a future rich person who will be living off of your investments, might find it very reassuring to brush up your own economic understanding if you haven't already done so. And the reason I can recommend this particular book is that it reads like a chatty, general-purpose version of The Economist magazine.

Starting with an explanation of the basic (surprisingly) non-capitalist economies that existed in Europe in ancient times, the book explains how the Industrial Revolution really got the ball rolling towards the money system we see today. Then it explains the conflicts between the ways of two of the most famous early economists – Adam Smith (the "Invisible Hand" of the free market) and John Maynard Keynes (who came along later and suggested government actions should be used to balance some of the most extreme effects of capitalism as seen during and after the Great Depression). Then it rushes through progressively more advanced topics until you are side-by-side with the Fed, issuing treasury securities and expanding/contracting the money supply. And beyond to globalization and international trade and currencies ("hey, why IS the US dollar not falling more if we supposedly have such a crushing debt?", is a question you might try to answer for yourself while reading the book).

The only flaw is that the latest edition of the book available is from 1998. Before the real dot-com boom and bust, or the ensuing recession, or the housing bubble and recent great financial crash. But in a way, that makes the book even more interesting, because the basic principles explained by the book seem even more valid in that they still hold just as true when applied to what happened in these more recent years! In my own mind, economics makes a great deal of sense and is actually quite predictable. It is only the increasingly volatile behavior of the people involved that throw temporary monkey wrenches into the system – as the system grows more complex due to this surprisingly new thing we have called globalization.

Economics is often a politically-charged subject. But this book manages to steer mostly clear of personal opinions and describe both sides of every argument, often presenting controversial aspects as questions rather than statements. The authors admit to having a liberal personal bias, but yet the book reads just like The Economist, which admits to having the opposite bias. I think this is a sign that they are both doing a good job at presenting economics objectively.

The book Economics Explained is by authors Robert Heilbroner and Lester Thurow.

** The Little Book that Beats the Market by Joel Greenblatt is a nice exception to this rule.*

Domestic Outsourcing: Practical or Wussypants?

By Mr. Money Mustache

Tue, 13 Sep 2011 12:37:19 +0000

A while ago, I had the pleasure of doing a guest posting a website called Frugal Dad. I noticed that the article that ran just before mine was about Outsourcing – Frugal Dad nicely illustrated his own battle between convenience and cash with a task he finds particularly unpleasant because of allergies – lawn mowing.

In the ensuing comments section, there was some interesting discussion on both sides, including some that expressed the attitude "Oh, I love outsourcing everything! My life is so clean and simple now, and it's the best $500 a month I could ever spend!" And you'll find similar chitchat on nearly every personal finance site.

I threw a comment of my own into that stream at the time, but the topic seems to come up in real life so often, especially among financially struggling high-income people, that it is time to proclaim **this blog's Official Position on Outsourcing.**

Mr. Money Mustache does not outsource ANYTHING*. He believes it is more fun to go through life as a producer rather than a consumer, and while the Monetary Implications of this are secondary to the Life Satisfaction Implications, the money part of it is still HUGE.

Let's begin with a historical tale. When I moved to Colorado in 1999 at the age of 25, I bought my first house. I met a friendly coworker who had just moved to the state as well, and he bought a house at the same time, right in the same neighborhood.

We each had big dreams for our houses, since they both were in need of some maintenance and upgrades to their fading original parts. We both started by tearing down unnecessary partition walls to open up the kitchen areas of the main floor. We celebrated with beers as we overlooked the sawdust and crumbled drywall chunks that littered the soon-to-be-removed ugly carpeting in our living rooms.

But then our paths diverged. I bought some drywall compound and a $25 texture hopper for my air compressor and set about learning how to patch the holes in the ceiling and match the existing finish. My friend paid $1200 to hire a drywall contractor to accomplish the same thing in his house (he later complained that cleaning up the dust and oversprayed plaster from this contractor took as long as I took to do the whole job).

The next summer, we each built a deck behind our house. Afraid of messing up the job, he hired a contractor to do the basic post work and framing, then he put the surface boards on himself. I borrowed a library book to learn to do the whole job myself.

The same pattern was repeated with flooring, exterior painting, lawn care, electrical upgrades, and kitchen renovation. We both had an interest in home renovation, but he just leaned slightly more towards convenience while I leaned towards stubborn independence. In each case, his hired subcontractors were a source of irritation, making mistakes and overbilling occasionally.

My own laborer was also relentlessly slow and imperfect, but his slowness forced me to pace my spending on materials: "No, Self, you can't spend $2000 on hardwood flooring, because you need to install the trim around these new windows before you are allowed to buy anything more."

And all of my old mistakes are still burned permanently into my current mind in the form of Useful Home Construction Knowledge I Will Never Forget.

Fast forwarding to the present year, I went on to build and renovate several houses as well as retire in part from the resulting earnings and lower expenditures, and my friend ended up scraping heavily against bankruptcy last year as debt and job loss caught up with him. (I'm not sure if he ended up escaping or going fully under as we are no longer on speaking terms – the subject of a future article on my Greatest Financial Mistake)

Even to this day, with my retirement income being more than enough to start paying people to do my work around the house for me, I still do everything myself.

A local tree-treatment company taped a card to my door that said, "The Maple tree in your front yard has yellow leaves because of an iron deficiency. Call us and we can save it!"

I ALMOST outsourced this task, because I love my tree. I called the company, but it turned out to be a big operation with a receptionist's voice prompting me through a voice menu, and I hung up immediately, imagining the bureaucratic and potentially expensive debacle that might follow if I hired them. So I looked up yellow leaves on silver maple trees ("Iron Chlorosis"), learned how to diagnose and treat both the soil and leaves, and spent an hour that weekend drilling out narrow core samples of soil with my son and pouring the treatment mixture down into the roots.

The new knowledge also helped me diagnose several other plants in my garden with a similar problem and treat them too. The net cost of this little bit of Gardening School was about $15, versus $800 to have the tree company do it, and I have new skills and knowledge that will be with me for life.

When a warning light comes on in my car, I read the code with a [$22 bluetooth car adapter] (connected to an app called Torque) and then consult the service manual and the Internet to learn about what needs fixing. It's usually a part that costs only a few dollars, so find that on Amazon and follow the wonderfully detailed instructions that people share on Youtube these days. I remove a few screws and clamps, put in the part, and then vroom, another year of trouble-free driving has been earned.

I feel that every time you do something for yourself, even if it's just washing your own car, you learn new things and build a more balanced personality that learns to love hard work even more. And you build diversity into your day, which allows you to work longer without realizing you are working.

If you're a graphic designer who works at home, you might charge clients $100 per hour for your work. So why would you take a break to cut your own grass, which takes 40 minutes and "only" saves you $25?

It's because you can't productively do your graphic design job every day from 7AM until 11PM. If you try, you will burn out after some number of hours, then need to switch to a non-productive activity to recuperate.

On the other hand, if you begin a day with pulling some weeds in your own garden, then crank out 7-8 hours of fantastically focused design work, then bike out to pick up your own groceries, and spend the evening cooking your own food, working on your own fitness program, cleaning your own dishes and reading library books and preparing for your next day of work, you have a routine that is free from outsourcing, free from unnecessary costs, yet so healthy and varied that you can do it forever without burning out.

In other words, domestic "work" may pay less than your day job when measured by the hour, but after you measure the lifetime personal benefits and the overall savings in after-tax dollars added up over an entire week, you may be pleasantly surprised by the results.

Insourcing also provides a nice way to pace your spending. An outsourcer can quickly call a kitchen contractor, a landscaper, and an auto mechanic and get a whole fleet of workers on the job right away. But the outsourcer then racks up $20,000 in bills that need to be paid within a month.

A self-sufficient insourcer thinks about his kitchen design, his garden design, and his car project, and decides which is most important to him. He schedules his time and works through the projects one at a time, savoring the results as they are produced. To an outside observer, they both get to the same place in the end, but the Insourcer has the added benefits of a deep satisfaction and a broad Money Mustache, while the Outsourcer simply has a higher outstanding loan balance to his creditors.

All of this will seem obvious to the most Oldschool Mustachians among us. But I can see the Outsourcing bug growing among the general populace, as the habits of the rich continue to trickle down to the middle class. To me, it's an easy decision for those seeking lifetime independence in both the mental and financial senses – you should broaden, rather than narrowing, the range of your daily work.

* *OK, I do buy food from stores and let the public school help out with my child's education, which are technically forms of outsourcing, but here we're just talking about household chores and a general life philosophy.*

A Brief History of the ‘Stash: How we Saved from Zero to Retirement in Nine Years

By Mr. Money Mustache

Thu, 15 Sep 2011 15:46:17 +0000

I have been asked many times to provide some more gritty details on how I became Mr. Money Mustache at such an early age. Commenters and email writers have asked me to provide Salaries and Savings amounts through the years, as well as describe any windfalls or unusual maneuvers that made it all possible.

I have hesitated to share the details until this point, mostly because I didn’t keep a written record through the years and it seemed pretty complicated and imprecise in my mind. Also, it’s embarrassing to walk around in your monetary underwear in front of thousands of people. But fuck it, many financial bloggers have graphs of their net worth right on the front page, so the least Mr. M. can do is provide a vague summary of some ancient history.

And for my own benefit, it is worth sorting things out just for the record, so doubters can be convinced, voyeurs can be entertained, and aspiring Mustachians can compare their own progress. So here it is, my best effort at retelling the story. From the fresh-faced new graduate in the earliest days of the Internet, right up to the leathery and bossy carpenter with grey hairs in his beard that types for you today.

Year 0 (1997): The Full-time working career begins. Mr. Money Mustache has just finished a grueling computer engineering degree and is now ready to party. He gets right to work in early May, skipping even the University graduation ceremony because he does't want to miss any work (he had already moved to a new city 300 miles away from the university).
Age: 22
Starting Salary: $41,000.
Student Loans: Zero – due to low spending, about $10k of help from parents and scholarships, and good high school and summer jobs.
But also absolutely ZERO net worth. No bank balances, never owned a car, just a bike, a backpack, and a diploma.

Year 1: In this first year I foolishly started out by buying a 3-years-new 1994 Ford Probe GT sports car for $16,000 with tax. And I borrowed money from my older sister to do it (what a clueless young man!!!). It took most of the first year to pay off that loan. I also flaunted my new salary around town with frequent bar-and-restaurant-hopping, purchases of computer equipment and furniture, accessories for my car, and a trip to a resort in Mexico. Fortunately, I did enroll in my employer's retirement savings plan. I also worked like a crazy company slave, enjoying weekends and late evenings in the office. Because of this, and a rising tech market in general, I got a raise to $57,600 at some point in the first year, resulting in a **Year 1 'Stash: $5000** (in a retirement account).

Year 2: Through both of these first two years, I lived with roommates by sharing a series of nice houses, which we called Nuthouse 1, 2, and 3. The rent averaged about $350 per month, plus some negligible share of utilities.

With the unnecessarily expensive car paid off and the higher salary, I was able to save more: $5000 into the retirement account, $3000 into an employee stock purchase plan, and $10000 in cash. **Year 2 'Stash: $23,000** ($13k cash/shares, $10k retirement).

Year 3: This was late 1999, and both the job and stock markets were on fire. I got a new job and moved to the United States for a salary of $77,000. I drove the ol' Probe GT down to Boulder, Colorado, and used the local newspaper to find another nice roommate situation, so my rent was only $400/month. I decided to buy a house – but was disappointed to learn that I would need $47,000 in cash for a downpayment on a starter home, which would cost a minimum of $235,000. I cashed out the stock purchase plan shares from year 2, which were now worth $10k, and saved up a few of my new higher paychecks. After a few months in the new job, I had the $47k downpayment. By that May, I closed out the year by moving into my first house. **Year 3 'Stash: 67k ($47k home equity, $10k retirement, $10k cash).**

Year 4: At this point, my future wife finally graduated from her longer and more meandering education up in Canada and decided to join me in Boulder. She drove down in her 1993 Civic hatchback, and hunted for a job. She found one for $44,000. And I was recruited to another nearby high tech company for the ridiculous salary of $83,000. Now things were getting crazy in the income department, although we weren't thinking about early retirement yet. During vacations, we toured much of the US including Hawaii, and took a trip to Australia and New Zealand at some point too. I saved 20% of my salary into the 401K and got a $5k match from the company, as did the girlfriend. We both started Vanguard accounts to capture any extra cash. We also made some extra mortgage payments occasionally. **Year 4 'Stash: $150k**

Year 5: We were still hard-working Career Beaks at this point, so we both scored raises. I earned $100k including company bonuses, and she earned $60k. I was also working heavily on the house renovations this year. We hosted many great parties at that house, and life was grand. This year, I foolishly took a $10,000 step backwards by buying a brand-new motorcycle with some of my easy-earned cash. But the investment gains on stocks started accumulating, adding about $10k to our earnings this year. So we still ended up increasing the savings by close to $100k after tax. **Year 5 'Stash: $250k.**

Year 6: Salary went up slightly because of an unexpected company bonus, and girlfriend earned a raise to $65k as well. AND, we didn't buy anything silly this year. In fact, I finally wised up and sold my car, and we became a one-car couple. I didn't miss the second car for a moment. Investment gains on the existing savings contributed another $20k. It is complicated to remember what portion of income was taxable salary, and what was non-taxable gains inside of retirement accounts and such. But a reasonable estimate of the total is **Year 6 'Stash: $365k.**

Year 7: No increases in salary, but similar amazing earnings and moderate spending, combined with $30k of investment gains. **Year 7 'Stash: $490k.**

Year 8: A raise to $70k for the now-wife(!). Meanwhile, I actually switched to 4-day-per-week work this year in exchange for a 20% pay cut – my first test of the waters of early retirement. But it was still a bumper year for me due to cashing out stock options, stock purchase plan, and annual bonus. My earnings must have been something crazy like $125k this year. Investment gains $40k. **Year 8 'Stash: $600k.**

Year 9: I quit my job!!! And I start a small house-building company as a semi-retirement job. It earns me about $50k in the first year, and wife still works for part of this year until the baby comes, earning $60k. In addition, we move to a new town and buy a cheaper house, renting out the first house for a very high positive cashflow due to a low mortgage and its increased value. At this point in the accounting, we will add in the appreciation of this house – which is about $100,000 after subtracting for the cost of the materials I used to renovate it. About $50,000 of this was due to market appreciation, and 50k due to renovation appreciation. Investment gains continued at about $35k. **Year 9 'Stash: $720k.**

Sometime during Year 9, we declared ourselves as "Retired!", as we quit full-time work to care for the baby. The rent from the previous house was more than covering the mortgages on both houses. However, part-time work also trickled in after the first few months of baby raising. Eventually we moved one more time to our current house and had two rentals. Eventually both rentals were sold and the gains were put elsewhere. And I became even wiser and sold my motorcycle, to free up both cash and garage space for my greater love: my workshop. **Year 10 'Stash: 800k or so**

Mixed in with those later years, but left out for clarity, was this house-building business of mine. It was a firecracker of success in the first year, then a firehose of disaster in the second year. I'll save the details for another time, but the end result is happy.. I'm just stuck with one newly-built house that is tying up a certain percentage of our retirement savings, while yielding a nice $2400 in monthly rent. Nowadays I do not build full houses and try to sell them – I closed the old company and the Mrs. and I started a cozy new two-person company that does whatever we want it to do. Custom renovations and finish work only for local, nice people on my side, and Real-estate sales for local, nice people on her side. This low-stress career agrees very well with us, and keeps me from sitting on the couch typing to YOU all day.

Some people will say, "But Wait! You just said you still work sometimes! That's not retirement!". To these people, I can only say, "You'll see". Because when you quit your corporate job, you end up with even more energy, which means you want to do more stuff! If some of this stuff happens to earn you money, so be it.

I define us as Retired, because that is a novel word to throw around for those under 50 that sounds much more interesting than "Financially Independent". Also, the cashflow from investments is much higher than our spending.. so work is only done for fun and on our own terms. For example, this year I stopped taking on carpentry work altogether for most of the year and just started typing this blog and doing other unpaid work like school volunteering. Other years, I may accidentally earn hundreds of thousands of additional dollars by starting another company. Who knows!? Even then, Mr. Money Mustache will still be retired, so there.

Since year 10, several more years have passed, and because the rental house pays all bills and we still do some work on the side when the boy is in school, the investment gains and income have just been building on themselves. We also paid off the mortgage on the primary house.

So.. even if we refuse to let ourselves do any more [enjoyable part-time work] from this point onwards, at some time in our lives we will either have to drastically increase our spending, or more likely, do some generous and worthwhile things with the surplus money to put it to good use.

Isn't that weird? That I would rather give money away completely, than spend it to hire a bunch of guys with noisy gas mowers and leaf blowers to cut my lawn for me every week so I could sit inside and watch them? Yes, folks, I point this out to show how frugality can grow on you, to the point that you'd rather live an efficient and self-sufficient life even if money were not an object.

I'm sure the questions will come about where these investment gains came from (I don't remember exactly, but I do remember doing a bit of accelerated buying of the S&P500 during the big tech recession in the early 2000s, as well as a few buy/sells of Cisco stock when it went down to $7 and subsequently recovered to $30). Most of it was just plain old dollar-cost-averaging and dividends. And the amount saved from capital gains is still small compared to the amount saved from old-fashioned not-buying-things. The fundamentals of this plan mostly involved the two of us living on a shared $30-40k of spending money per year, including housing costs, and saving the rest. The biggest single factor producing this low living cost was probably deciding to live close to work and [not commute excessively by car].

Other people will scoff at the high salaries involved, compared to the US median level. I won't deny that – we had it easy, which is why we retired in our early thirties. But many people I currently know earn much more than us, and software engineering salaries are much higher than they were when I quit. I may have lucked out on the tech boom, but people working in high-tech today are lucking out even more. Yet many of these people don't even own their cars, let alone their financial future. So I still think it is worthwhile sharing these details. More normal salaries, of course, would require some adjustment to this plan. You might decide to settle down in a house that costs less than the $400,000 that is tied up unproductively in my current house, for example. Or you might decide to work as late as 40 or even 45! But in almost any middle-income situation, retirement is something that can be earned drastically earlier than age 60-65, if you start early enough.

 ** Photo: the spiral stairs leading to a third-floor loft on one of those houses I built. Photo credit goes to friend Intiaz Rahim who whipped up a very fine series of pics during a visit in 2010.*

The Race to Retirement – Revisited

By Mr. Money Mustache

Sat, 17 Sep 2011 20:19:01 +0000

Earlier this week, I spilled the beans and detailed Mr and Mrs. Money Mustache's combined savings history from zero net worth to retirement. In the article, I tried to explain that it wasn't a struggle or a sacrifice to become financially independent in nine years, it was in fact unavoidable.

If you get paid a ridiculous amount of money, and spend only a normal amount of money, it builds up very quickly to become an accelerating and unstoppable force, like a snowball on a steep hill. And many people agreed that with a top salary of $125,000 per year, and a wife that made it up to $70k in her short career, we were indeed earning a ridiculous amount of money.

Weren't we?

Let's look at the averages over that 9-year period.
Starting from graduation, I earned 41, 57,77,83,100,110,110,125, and 50k
During the parallel years, my girlfriend-then-later-wife earned 0,0,0,44,60,65,65,70,60

So my 9-year average earnings were $83,000, and hers were $40,400. When we average our salaries together, we were equivalent to a couple earning $61,700 each.
PLUS I made a $100,000 profit from renovating one of our houses and some appreciation. That brings up the annual average to $67,255 each.

So if you happen to be part of a working couple earning this much each – congratulations, you are no more than nine years from retirement, even if your net worth is currently ZERO!

But what about a more typical family – say, a high-school teacher (median US salary $51,000 according to Wikipedia) and an elementary school teacher ($40,000 from payscale.com) with a kid and a mortgage on a $200,000 house. These folks have a combined before-tax income of $91,000, which works out to $80k after federal and state taxes according to the tax calculator at efile.com.

Let's say they [spend just as much as the MMM family does]() for our lavish lifestyle with plenty of travel, great bicycles, and two cars ($24k per year), plus have zero equity on their $200,000 house, so they pay $10,000 of interest per year on that as well. Total spending is thus, $34k/year, leaving $46k of their $80k take-home pay available to save.

We will assume their savings earn a 5% return, whether from paying off the mortgage or saving in index funds:

End of Year 1 'Stash: = $46,000, plus investment gains of $1150, total = $47,150
Year 2: $47,150 + 46,000 + $3507 investment gains = $96657
Year 3: $99,657 + 46,000 + $6132 investment gains = $151,790
Year 4: $151,790 + $46,000 + $8739 investment gains = $206,529
Year 5: $206529 + $46,000 + $11,476 investment gains = $264,005
Year 6: $264,005 + $46,000 + $14,350 investment gains = $324,355
Year 7: $324,355 + $46,000 + $17,367 investment gains = $387723
Year 8: $387722 + $46,000 + $20,536 investment gains = $454258
Year 9: $454,258 + $46,000 + $23,863 investment gains = $524120
Year 10: $524120 + $46,000 + $27356 investment gains = $597476
Year 11: $597476 + $46,000 + $31024 investment gains = $674,500
Year 12: $674,500 + $46,000 + $33,724 investment gains = $754,224
Year 13: $754,224 + $46,000 + $38861 investment gains = $839085

OOPS! The investment gains are larger than your entire living expense! Congratulations, you are retired!

So with two median US teachers, the maximum reasonable length of a career under MMM Principles is thirteen years. This puts our quintessential teacher couple out on the streets enjoying an early retirement by their mid-thirties at the latest – assuming no teacher pension, no social security, and no career advancement – only 2% annual raises to keep up with inflation.

It's just basic math, but it's a very happy type of math, since it means that even for an average middle-class salary, early retirement WELL BEFORE AGE 40 is not at all an extreme goal.

Guest Posting – Notes From The Laundry Room

By Mr. Money Mustache

Tue, 20 Sep 2011 12:43:44 +0000

This is fantastic! Just when Mr. Money Mustache is starting to get a bit overloaded with answering email questions and comments from readers, volunteer work at the local school, building a stone wall around one of the gardens, starting a new carpentry project in the neighborhood, and trying to write new articles here and there, a generous fan comes along and submits a guest article for me to display.

Today's article is from an established author from the excellent WikiHow website, with pen name Dvortygirl. She has initiated over 200 articles on that site on subjects ranging from crafty Home Economics to High Tech. She stumbled across MMM from a feature on LifeHacker.

Do YOU like writing about Mustachian Subjects like Money, Efficiency, Investing, or your Own story of Frugality or Badassity? Do you want to share it with a large audience of interesting interested people? If so, feel free to email me with your idea. It is always fun to share with your friends. So here we go. Thanks again Dvortygirl!

Notes from the Laundry Room

Laundry isn't very interesting, which means that the person doing it has plenty of time to think. For those of us who like to think about saving money, we can find plenty of opportunities to do so that involve clothes and laundry.

Here are some of my favorite ways to economize.

1. Leave your dryer lonely. Did you know there's no such thing as an Energy Star Dryer? The Energy Star folks say, "ENERGY STAR does not label clothes dryers because most dryers use similar amounts of energy, which means there is little difference in the energy use between models." Translation: all dryers use a lot of energy. As long as the air is warm and dry enough to make it practical, air dry your clothes on a line or rack. If it's too cold or humid, if you want to smooth out some wrinkles (many clothes don't need it), or if you can't bear the thought of stiff, scratchy towels, give them 5-10 minutes in your dryer while they're still a bit damp.

2. Find and use a bar of laundry soap. I don't advocate a return to laborious hand washing, but for things you were going to hand wash anyway, and for treating stains, a $1 bar of laundry soap is priceless, and it can last a year or more. As an added bonus, take a piece of it with you the next time you travel (it's solid, so no TSA hassle) and wash the same few changes of clothes repeatedly, rather than paying extra and braving the luggage monsters to check a bag.

3. Use used clothes. Yeah, this gets personal, but check your local thrift stores, garage sales and rummage sales, and if you have kids, encourage hand-me-downs. People get rid of all kinds of clothes for all kinds of reasons, including outgrowing them and just not liking the style anymore. And because they want to get rid of the stuff, it costs next to nothing. Wash them when you get them home. Environmental bonuses: you're not requiring the creation or fabrication of new resources, and you're diverting some of the enormous stream of used clothing from flooding local markets in third world countries.

4. Read clothing labels before you buy. No, not the labels that say the designer's name. Read the care labels. Steer clear of things that need super-special treatment like hand washing or (especially) dry cleaning. Or, if you only paid a dollar at a garage sale anyway, try washing a dry clean item by

hand or (cautiously) with your regular clothing. Some will run or shrink, but some will fare just fine in the normal wash.

5. Learn some basic mending, at least how to sew a button and how to mend a tear that's on a seam. If you are your children are shorter than the general population, it's worth knowing how to hem pants and shirts, too. Often, a minor repair can extend the usable life of a garment significantly.

6. Don't follow fashion, at least not too closely. The classics can look like a million bucks even as you build your million bucks in the bank. Basics are often easier to care for, too. If you want to dress it up, try the DIY approach and try hacking your fashions yourself. Threadbanger is a great place to go for advice and inspiration.

7. Use fabric napkins, towels, and cleaning cloths instead of paper. It makes for a little bit of extra laundry, but you're air drying it, and you're using less disposable paper. Give each family member a fabric napkin they can identify as their own (use different patterns or embellish them). They can use the napkins for more than one meal. For the cleaning cloths, get a pile of cotton terry cloths from your favorite big-box store or janitorial supply place. You can use them in place of many rolls of paper towels and wash them all at once. They can be folded to expose many different clean sides, and they don't shred or disintegrate on contact with water. I even stick a damp one on my Swiffer mop for spot mopping, rather than buy expensive refills.

The next time you're doing laundry, use those extra mental cycles to cogitate on how you might economize on laundry, and please use the comments to let us know what you think up.

(Dvortygirl)

$3 Per Month: The Largest Possible Music Budget

By Mr. Money Mustache

Fri, 23 Sep 2011 20:06:49 +0000

 Mr. Money Mustache loves his music.

I need a constant soundtrack of it at all times – different types of music for breakfast-eating, house-building, furniture-making, driving, blog-writing, exercising, dancing, house cleaning, patio beer-drinking-and-campfire-having, and more. And it has to be different music all the time – no repeating the same song within a week (preferably a month), different genres throughout each day, and of course absolutely no talking or commercials interrupting the mix, ever.

With a habit like this, you can imagine that I have to spend a lot of time collecting and organizing the music, and making mixes that meet my stringent requirements. And in the past, I have spent a lot of money on the hobby as well. Let's talk about those olden days to explain how things were, and how they have changed.

Ever since that golden day when my dad brought home a little battery-powered radio from an advertising industry trade show, I have been hooked. I used to slip the flat radio under my pillow before going to sleep each night as a 9-year-old, and one of my parents would quietly reach under my sleeping head and turn it off on their own way to bed later that night. At the time, I listened to an AM rock station called CKOC that played the cutting edge early '80s rock and pop music that thrilled youngsters of my generation. Toto's *Africa* and much of Michael Jackson's *Thriller* album blew little Pre-teen MMM's mind.

As the years went on, my interest grew. I bought my first double-cassette deck portable stereo ("ghetto blaster", as we called them back then, despite the fact that we lived in a crime-free town, population 4,000, and thus there were no ghettos available to blast). I started buying tapes, meticulously recording songs from the weekly American Top 40 broadcast with Casey Kasem, and swapping recordings of records and tapes with friends. I discovered the concept of High Quality Sound, and commandeered the stereo system from the family living room for my own bedroom. After scoring my first minimum-wage job, I went crazy and bought an $1100 stereo system of my own, and some of my budding little audiophile friends followed suit. CDs were invented and we bought some of the first CD players and started accumulating CDs at a brisk pace, despite their punishing $20-per-disc price ($36.38 in today's dollars if you adjust for inflation). I joined, and quit, the Columbia House music club repeatedly as a way of getting more CDs for less.

That was a funny time in our lives, since our spending on music as a percentage of income was ridiculous. By the age of 17, I had amassed about 300 CDs, representing well over $4000 of casual spending collected onto one heavy bookshelf. This is comparable to me buying and maintaining a multi-bedroom luxury motor yacht today, something which I obviously would not even consider. But kids will be kids, and Mr. Money Mustache wasn't around to admonish me at the time for the careless spending.

But thankfully, both the Internet and the globalization of manufacturing have come along, and completely wiped out the old model. It's much more difficult for Leather-clad Hair Metal bands like Kiss, Winger, Slaughter, and Quiet Riot to pack stadiums while simultaneously making millions for themselves and their managers and merchandisers and owners. But it's much easier for independent musicians like my brother Wax Mannequin to spread the word and gain a moderate but dedicated fan base that spans a few countries and lets them travel and rock out upon many ‘a’ fine stage. And music consumers like myself have enjoyed the effects of Napster, Usenet newsgroups, eMule, Bit Torrent, and many other technologies that have fleshed out music collections worldwide at minimal expense, even while we enjoy buying the music of local musicians directly after a barroom concert, with cash, over a compliment and a handshake.

The thing about music for music enthusiasts is that we need a LOT of it. If I listen to music for an average of 4 hours a day, 30 days a month, with no repeats, I’d need a rotation of 1440 songs, or $1440 dollars worth of music at iTunes prices just to get me through the first month.

In the bad old days, a listener was trapped in a triangle between the options of Incredible Expense, Time-Consuming and Possibly-Illegal Piracy, or Awful Commercial-laden FM radio.

Then Internet Radio came along.

Suddenly there were thousands of streaming radio stations playing nice DJ-arranged mixes of music, supported only by small visual ads but no intrusive audio ads. It was a huge step forward, especially for office workers who want to groove along with headphones all day while they work on their computers. But each DJ’s taste still seemed to differ from my own, such that an annoying tuneless grating noise song or a schlocky Celine Dion-style ballad would pop incongruously into the mix and snap me out of my concentration.   Because of this risk, I often had to resort back to my own digital music collection and the attendant time expenditures.

But one year ago, I discovered a nice hybrid of the two systems: Pandora Internet Radio. You type in the name of a musician, like my favorite Jazz piano player Ahmad Jamal. Pandora automatically creates a “Station” that plays only Ahmad Jamal and similar musicians.. 24 hours a day, advertising free, as long as you pony up the $36 per year fee for the premium Pandora One service.

If a station ever plays a song you don’t like, you run over to your computer and click the “thumbs down” button. This feeds back into Pandora’s algorithm to further figure out your tastes and make the station even better.

I have been a paying Pandora subscriber for one year, and it has been a constant companion for me, streaming out of my laptop into the main stereo at home, and out of my iPhone into the Construction Radio when I am out in the yard or at a party or job site.

I've created and customized about 30 stations, each of which draw upon thousands of songs, and I get to sit back and mix and match them for the event at hand. Ahmad Jamal, Alana Davis, Action Figure Party, AC/DC, The Biscuit Burners, Celia Cruz, The Dining Rooms, DJ Shadow, Don Ross, Fila Brazillia, India Arie, Jurassic 5 (best hip-hop group ever), Manu Chao, Me'Shell NdegeOcello, Medeski Martin and Wood, Mountain Brothers, Red Hot Chili Peppers, Strunz & Farah, Turntablism & Beat Science, and the classic early hip-hoppers Young MC/Digital Underground are just some of my stations that form the broad foundation of this crazy new world of infinite music listening.

Pandora satisfies my desire for high quality audio as well. With the premium service, I get streaming at a bitrate of 192kb/sec using a compression method that is more advanced than MP3 (aacPlus). I run this sound stream out of the digital output on the back of my laptop, into my beefy Yamaha receiver, where the digital-to-analog conversion is done in a nice low-noise environment. It is amplified with a fantastic amount of clean power, and pumped out to the gorgeous row of woofers and tweeters depicted in the headline photo of this article. The end result is rich, detailed concerts in my living room, where the fine hairs of brushes hitting the drums strike out into the kitchen, and where the Bass tickles your buttocks at strategic moments. (I will admit that in the area of music reproduction, my frugality has broken down in earlier years. Someday when I lead a more minimalist life, this equipment will have to go.. but for now, the MMM Household rocks on.)

All at a monthly cost of only 3 songs from iTunes, or 3 Justin Bieber ringtones that a teen might purchase for her phone while walking around in the shopping mall. If I can get all this legally for $3 per month, it is hard to imagine spending more in any situation. So I am actually enjoying the most decadent and expensive music collection that can possibly be justified.

It makes me wonder who these people are that are pumping hundreds of their hard-earned employees into Apple's iTunes store each year, when I already have the largest music collection imaginable at $3 per month!

Sometimes it is great to be a big spender.

Reader Case Study: Minimum Wage with a Baby on the Way

By Mr. Money Mustache

Mon, 26 Sep 2011 12:04:17 +0000

I originally started this blog to both Ridicule and Educate the rich and privileged group of people known as the American middle class. Being a newly minted member of this group myself, I feel that we are all living large, and the vast majority of our financial problems are of our own making. Thus the solution is simply to get everyone to stop complaining and start saving.

But as time has gone by, I have learned that there actually many people out there who are not currently being showered in easy salaried office worker cash. They have been writing to me for advice, and due to the 20 year period since my own minimum wage days, I have not known what to say.

But let's have a crack at it together, by studying the situation of this young guy who just wrote to me recently:

> Hello Mr. 'Stache,
>
> You strike a chord with people who realize that their goals of financial security are insane considering the fact that most are living outside their means. I know you've caught my attention. Unfortunately I have stumbled upon your blog too late to save myself from a lot of debt.

I have a cheap mortgage, sure, but I've added two auto loans and a few maxed out credit cards. My wife and I (aged 21 and 22) combine to bring home around $2000 a month working fast food. She commutes 20 miles to work by car daily and I'm fortunate enough to have a job 2 miles away. We live in a very small town on the highway so cheap groceries are a half-hour commute away.

We are also fortunate to have extra room in our house for now to rent out, so we receive $1000 a month in rental payments to help us.

I desperately want to provide a comfortable and enriching life for my son, who will be born in January. I've decided that the TV bill has to go and that we need to pay down the credit cards and auto loans ASAP. We will also be cutting out our fast food expenses entirely (easier said than done). Reading your methods gives me hope that I can achieve some financial security and have home time to raise my child the way I dream of. Thank you for the inspiration.

Key Financial Details:
Cash on Hand: $290

Credit Card Debt: $3645 spread across 3 credit cards, with $120 in minimum monthly payments
Mortgage: $75,164 balance with $502 monthly payments. 28.5 years left. Appraised on purchase at $89,000.
2007 Nissan Versa: $12,700 balance with $240 monthly payments, 5 years left
2004 Chrysler Sebring: $3500 estimated balance with $220 monthly payments and 3.5 years left

Monthly expenses:
$130 auto insurance monthly
$220 last electric bill (Normal months, the bill is around $140)
$20 water bill
$24 a month for trash pickup service
$100 a month for satellite tv (an obvious area for improvement, but it isn't easy to convince the rest of the family about the waste here)
$45 a month for internet

$250 a month average for 5 cell phone lines (on behalf of a few family members including my wife and I)
$50 estimated in gasoline a week for travel to work & other appointments
$300 a month or so on groceries.
$60/month in fast food (recently cut down from $400)

Total Expenses including Loans:
120+502+240+220+130+140+20+24+100+45+250+50+300+60 **= $2171**

Income:
$880/month (at $7.35/hr x 35hrs) for me. My job is about 2 miles from the house. I do own a bicycle and plan on using it more as the weather cools down.
$1100/month for my wife ($8.50/hr for 40 hours a week). Her job is 20 miles down the interstate. She is also pregnant and due in January with our first baby, a boy. We have not yet spent any of our own income on the child. We have been gifted a lot of clothing and supplies. We already have a crib from when I was a baby.
$1000/month from renting out two extra bedrooms in the house.
Neither of us are expecting major income boosts within the next few years. Her best case scenario in the current line of work is ending up with a $25-30,000 salary within a couple of years, worst case is she stays around her current pay with slight raises during that time.

Total Income: $2980/month
——————————————————-

First of all, I'll start with the obligatory "AAAAAUUUUGGGHHH!!!!!!
HOLY SHIT, WHAT ARE YOU DOING, MAN!?!"

But then we can get into some real analysis.

First of all, on the surface it looks like your income is quite a bit higher than your expenses, even at current levels. Most significantly, you are making a killing on your house, by living there AND getting $1000 in monthly income from it, even while the whole thing only costs you $500 per month. Fantastic work!!

You should be able to pay down about $800 per month of debt even before you undergo the radical changes I am about to throw down upon you. We can cut a load from your expenses, and I also think you deserve to be making a hell of a lot more than Minimum Wage, so we can work on that too.

Let's start with the expenses:
First of all, your vehicle fleet is *off the hook*. I am Mr. Money Mustache Himself, and yet my vehicle fleet is only worth about HALF of what you have sitting in your driveway. A 2007 Automobile?? Damn brother, I thought I was being ridiculously frivolous by keeping around my 2005 Scion, which still has the new car smell.

If you need a ***loan*** for a car, YOU DEFINITELY CANNOT AFFORD THAT CAR, so what can we do? We need to unload one or both cars, of course!

Looking at the Edmunds Used Car appraisal, the Versa is worth about $8100, and the Sebring is worth $4500. That means you are $4,000 underwater on the Versa, but possibly above water on the older car. It is difficult to sell a car when you have a larger loan than the car, since the lender won't sign over the title until you pay off the loan. So for now, we're going to sell that Chrysler. You don't need a second car, because you live 2 miles from work. That is a close enough distance that it can be done by bike in about 7 minutes in nice weather, and on foot if you live somewhere with deep snow or other non-bike conditions in the off-season. Hell, you could even *swim* that distance. **There's your first $220 per month in savings!**

The $12,000+ Nissan Versa was a HUGE mistake for someone with your income level, but at least it is an excellent and reliable car with good fuel efficiency. Over time, you can pay down the loan balance, sell the car, and buy a $4,000 car like a late 1990s Honda/Toyota/Nissan IN CASH instead. Make sure it's a hatchback or a wagon, so you have room for baby stuff once your baby comes.

Depending on your eventual career path, you might need a second motorized vehicle someday. If you're not carrying around tools, you can get around quickly and cheaply with a Scooter.

Your car insurance sounds very high for a rural area. Just in case I'm right, spend an hour poking around on the online insurance sites, including Geico. Select the highest deductible and minimum coverage your auto loans will allow (which is probably still very thorough coverage, since those lenders are sticklers about protecting their collateral.)

Also shop around for house insurance. You might save a couple hundred per year on this as well. Geico has several affiliated homeowners insurance companies. Call by phone and ask them to give you a quote from whichever company comes in lowest for your property.

Next, of course, the cable TV has to go. I mean, right now, before you finish reading this sentence. Again, that is such an insanely high monthly bill for such a useless service, I could barely breathe knowing it was connected to my house sucking out my life energy. **Cumulative Savings so far: $320 Per Month**

Next let's have a look at your electricity bill. I have a family of 3 and a 2600 square foot house, a busy professional woodshop, and a blogging and computer habit, and my electric bill is about $30 per month. Yours should be only a bit higher with 4 people. Unplug your electric dryer, since you'll be hanging clothes to dry, make sure ALL lights in your house (except very rarely used ones like closets) are compact fluorescent bulbs, and if you have an electric water heater, turn down the temperature and make sure your shower has a low-flow (2 GPM) head. **Cumulative Savings: $420 Per Month**

Cell phone plans at $250 a month!?!? What are you, Steve Jobs? You new plans will be PRE-PAID mobile phones with a $0 monthly fee. You make short calls when you need to, using maybe 5 minutes a day. For your longer conversations, you use Google Voice on your computer, for free, from home. Your new phone budget is $60 per month. **Cumulative Savings: $610 Per Month**

Fast Food: Mr. Money Mustache doesn't buy it, so you don't need to either. That will cut your monthly costs somewhat (although you will have to buy a bit more fresh food at the grocery store to replace the empty calories). It will also improve your health and save you drastically on health care bills over the long-run. **Cumulative Savings: $650 Per Month**

Driving: You've got a bad situation for now, with a 40-mile round-trip commute for your wife. Using the IRS-standard estimate of total cost of driving of 55.5 cents per mile, she is losing $22.20 every time she drives to work. That's more than THREE HOURS of her work, not to mention the HOUR OF HER LIFE that gets wasted EVERY DAY by living so far from work! Of course, the IRS figure is the TOTAL cost of driving rather than just the marginal cost. But even marginal cost, with gas, oil, tires, maintenance, and wear, is more than you can afford. In the long run, to be financially independent you should both live within biking distance of work. Once you have built the foundation of your 'Stash, you might be able to rent out your entire house (or sell it) and find one (rent or buy), in the middle of a town with better employment possibilities.

Similarly, that 60-mile roundtrip to the grocery store is costing you a crazy amount. This trip should not be done more than once per month, and it should be a big $250+ bonanza to make it worthwhile. Then you get your milk and bananas at the local store, even if it costs more, during the non-bonanza weeks. I live 20 miles from Costco, and I go only every 3-6 months..usually combined with another errand in the area. That is how carefully I avoid driving just for the purpose of shopping.

OK, now you'll have expenses that are $650 + 800 lower than your total income. That's $1200 in debt reduction you can do each month.

The first three months will go towards paying off the credit cards. Then, you will cancel two of them, and keep one for emergencies. Of course, you will NEVER let the balance go unpaid in full again. If there is a risk of this ever happening again, cancel the third card as well and just use a bank account debit card, since credit cards are NOT for borrowing money.. they are just for conveniently tracking your expenses and getting a few cash-back bucks each month.

The next $12,000 of savings will go towards paying off your car, so you can eliminate that car payment.

There is a time limitation here, however, since you're having a baby in January. At that point, you will lose at least one income, plus you'll probably incur some out-of-pocket medical expenses for the birth. With your wages, it will be far cheaper to have one parent (probably Dad) stay home with the baby, rather than to pay $1000+ per month for full-time daycare. Unless you are eligible for some sort of social assistance or have family who will do the care for you for free. On the positive side, you are on the right track with the minimal baby spending – see Mrs. Money Mustache's article on What Newborn Babies Really Need.

That's the harsh reality on your costs – you are spending more than my entire family, but don't yet have the income to back it up. But there is some good news – YOU have a great chance to drastically increase your own income.

Both you and your wife are currently underpaid. I don't care what you do for a living – under ten bucks an hour is a shitty wage even for a 15-year-old-high-school student to be earning at his first job. When I hire laborers to help me occasionally in carpentry or even dig trenches for an irrigation system, I would be embarrassed to pay them less than $12 per hour. HOUSE CLEANERS CHARGE $25 to $40 PER HOUR FOR VACUUMING CARPETS!! Millions of people in our country unfortunately do receive minimum wage, but it should be regarded as an insult to your usefulness as a human, and you should fight like hell to earn more.

Do you have any skills? I notice you are a very good writer. What about using that, plus your free time, to get the word out and pick up some freelance work? Computer assistance, carpentry/handyman work, apprenticeship with a local plumber or electrician, house cleaning, errand running, carpet steam cleaning, duct cleaning, auto mechanic work, waiter/bartender, teaching music or art lessons, selling stuff on Ebay/Craigslist or administrative assistant work at a good company. I don't know what the economy is like in your area, but hopefully there are at least other people and businesses around. And with the Internet, you can make money everywhere. Look at Craigslist and other job postings, and apply every day. With your new time saved from canceling the TV service, read library books and old articles on Iwillteachyoutoberich.com to get yourself pumped up about earning extra money for yourself.

My mission, for both you and your wife, is to fight your way up to at LEAST $35,000 per year each, as this is an absolute baseline for a fair level of pay for a hardworking person.

Even a plumber, which is an enjoyable job you can learn in about two years, is able to charge $60-$80 per hour, which is $120-160k on an annualized basis if he is able to work full-time. A self-employed tile installer, who meticulously cuts and sticks tiles onto bathroom floors and showers, can charge $40 per hour. You can learn this job with about 6 months of on-the-job practice working for another contractor, then you buy yourself about $1500 of equipment, throw it into an old Ford Ranger for $1500, and you are now an $80k contractor, set for life.

I wish you and your family all the best, and hopefully my bossy voice will be in your ears for years to come as you build up a more secure life for yourself.

Get Rich With: Moving to a Better Place

By Mr. Money Mustache

Wed, 28 Sep 2011 12:06:41 +0000

 If you’re like me, you currently live somewhere. But can you explain WHY exactly you live there?

For most people throughout the history of our species, the reason they live somewhere is because they were born nearby. And the reason they were born there is because their parents were born nearby.

Very rarely, a brave and enterprising person will make a Big Move to a whole new place in search of wealth or happiness. Some of your ancestors did that, forming an interesting chapter in your family history. And maybe even YOU have done that in your own lifetime, and you’re currently living far from where you were born, probably because of a bold personal choice you made. Good for you!

I’m bringing up this topic because I am often amazed at the disparity in Niceness between different regions of the US (and of other countries and parts of the world in general). There are some areas which have drastically better weather, or landscape, or outdoor recreation, tax rates, job possibilities, mountains, ocean, lakes, beaches — you name it. And yet, as I study the areas with the best attributes, the cost of living in these areas is often completely uncorrelated with how nice they are.

I like to make fun of the New York/New Jersey region, because it is just amazingly expensive and crowded, and yet it is completely unremarkable compared to the rest of the United States – humid summers, rainy and cold winters, limited access to wide-open natural areas. All wrapped in a package of heavy regulations on small business owners like myself and shocking property taxes (annual tax on a house like mine would be over $10,000 there vs. $2300 that I pay now, even while the house itself would probably be a 1-bedroom shack in my under-$400,000 price range). It is true that some people make ridiculous salaries in New York City, and for those people it is logical to live there for a short time to maximize their savings. Others actually like it there, and of course many are tied by strong family bonds, which are very important. But after we rule out those groups, there are still millions of people who are just there because they are there, living a crowded and expensive life just because they haven't realized how energizing it can be to MOVE.

Meanwhile, I've seen a lot of other parts of the US on my many roadtrips over the past decade. When visiting Tucson, Arizona and Albuquerque, New Mexico, I was astounded by the gorgeous scenery, neverending clear blue skies, and the extremely low cost at which you can pick up a stylish stucco house on a palm-treed lot in nice parts of town near the university. Especially after the housing price crash we've enjoyed in recent years in this country. My own Colorado is mostly cheap and presents a nice balance of culture, recreation, and reasonable outdoorsy year-round climate.

Update: *this article was first written in 2011, and the US has been on a non-stop house appreciation binge since then. So, although many cities in my country remain very affordable, other prices are pretty out of date.*

But recently (2016), an MMM reader developed a global search tool to help seek out cool, inexpensive places to live around the world. It's really well done and still expanding: check him out at ***The Earth Awaits*** *–* [*https://www.theearthawaits.com/*](https://www.theearthawaits.com/)

In Las Vegas, you can get a very nice house in many parts of town for about $100 grand. A stylish condo near the strip which you can rent out to tourists for massive profits as a vacation rental, or a spacious modern house with a pool out near the foothills where you can swim and hike out of your back yard, and never see winter again. You won't care about the housing market or even the job market, because your cost of living will be so low that you may be able to retire a decade earlier than normal! The same story of palm trees and neverending warmth combined with negligible living costs now exists in Phoenix, AZ, and even the desert suburbs near the foothills just East of Los Angeles.

In the Pacific Northwest you can live affordably in the land of Beer and Beards in hip towns like Portland, Oregon or Bellingham, Washington. You can even live on a rainforesty island in the nearby San Juan Islands, and spend many of your days exploring coastlines by kayak.

In the 200-mile-stretch of beach cities around Miami, you can pick up a luxury house, or a snappy condo complex with a sweet pool and hottub, or a skyscraper overlooking the beaches and turquoise waters, for pennies on the dollar thanks to bank foreclosures, making a waterfront tropical beach compound less costly than a vinyl-clad shack in a Toronto suburb.

Ahh, Toronto, the Big City near my birthplace. It's the Canadian version of NYC. People pay fantastic amounts for modest houses that are buried in stale brown snow for several months each year, and commute 40 minutes each way through a 16-lane traffic jam to get to their jobs. Or Fort McMurray, Alberta, where people pay Toronto prices to live in a Mosquito Tundra near the arctic circle, just to plug themselves into an above-market income stream from the Saudi-Arabia-sized Oil Sands project that is in a permanent expansion there. What kind of life is this!?!?

Canada has the fantastic Oceany Cliffs of the Maritimes, where everyone is friendly, houses near the sea are nearly free, and the parties are legendary. It has the Sunny Granola/Marijuana hippy belt in Interior BC and the Okanagan valley. There's the Hong Kong Cosmopolitan buzz of Vancouver, with its non-snowy winters, or the Indie Rock/University Town/Island vibe of Victoria.

I also love Australia and New Zealand, where pleasantly different and fun-loving cultures combine with much more Ocean and noticeably cheaper Food and Beer – all in a gorgeous climate that rivals the best parts of North America.

With the increasing number of careers and entrepreneurial businesses that can be done from ANYWHERE through teleworking, and the fact that an ambitious person can carve out a job for themselves in almost any city, I think that moving is often a fantastic idea, and it is mainly fear of the unknown and fear of change that is holding people back.

When I graduated from Engineering school, I moved 300 miles away from my hometown, because that was the location of the best jobs that I knew about at the time. It was also where my wonderful sisters and my girlfriend, the future Mrs M., lived. But as my career progressed, I learned about the work opportunities South of the border. They sounded fantastic, as did the increased choice of geographic settings, versus those available in my native Ontario ("Smoggy metropolis", "Mosquito Forest", or "Mosquito Swamp"). I did the research, got the interviews, fought for the work permits, and BOOM, here I was in a fantastic new land of untold adventure.

I can't even express the joy this decision has brought to my life over the past twelve years. It's strange, because I cannot deny that regardless of where you move, you are still the same person. So some would suggest that you should be equally happy regardless of your surroundings. But it doesn't seem to work that way for me. I think that for some people, there really is A BETTER PLACE. For me, it was the presence of mostly nature and sunshine with just enough city thrown in to make life convenient, and the odd combination of culture in the Boulder, Colorado area that starts with an entrepreneurial and educated base, but throws the whole Workaholic thing out the window and seeks Quality of Life instead. Sure, we still have douchebag consumerism and the odd clueless fancypants daintily laying grocery bags into the back of an empty Cadillac Escalade. But it's drastically less than in other areas. And the much-mentioned pressure to compete based on material possessions seems to be nonexistent in the area I live myself.

And let's not forget the *economic* argument to moving. For me, the irresistible combination of higher income, lower taxes, and a lower cost of living was the thing that allowed me to retire so early. If I had not moved here at age 24, I'd probably still be working an increasingly monotonous high-salary job to this very day back in Canada. Mr. Money Mustache would not even exist yet! Early retirement is still completely feasible in any capitalist economy, of course – it's just speedier in some areas than others.

So the combination of geography, climate, culture, and economy is what makes me happy in my particular Better Place.

I do miss my family, especially when I read the emails about casual get-togethers that I missed out on because of living 1700 miles away. But we were always a far-flung family who got together only a couple times a year anyway. With the new model of making a six-week visit every summer, we get almost as much visiting time, without having to give up the benefits of the better life when not visiting.

Moving is easy when you're young, fresh out of college, and with no kids. It is mostly in the minds of those people that I am trying to plant these ideas. Considering new cities is like reviewing a broad and exciting variety of new dishes and deciding which one to eat. I highly recommend doing this type of dreaming and strategizing when you are young. My own way of browsing involves reading Best Places to Live lists, touring the country and the world in person, and virtually flying around to check out the terrain and the bike paths using Google Earth (and the house prices and 'hoods using Realtor.com).

The Ultimate Human-friendly city in my own view is one with a population between 50,000 and 200,000, in a compact and bikeable footprint, separated from neighboring cities by Actual Cows And Fields, as opposed to the fake cities that exist by the dozen on the sides of giant cities. Denver has "Lakewood, Englewood, Centennial, Aurora, Westminster" and a bunch of other silly non-cities attached to it. It should all just be called DENVER. But you have to drive for some time and pass a number of different crops and animals before you reach the distinct cities of Boulder and Longmont, for example. This distinct city status ensures that you'll have everything you need right in your own town, and yet you'll be able to hit the streets and very quickly end up in the country soaking up open vistas and black starry skies, even without resorting to car transportation. Your cell phone will have data access, FedEx will deliver your Amazon packages efficiently.. but yet you'll never find yourself paying to enter a parking garage or waiting in an endless line for a restaurant. There is space for everyone in these Person-friendly cities.

For slightly older and more settled folks like the MMM family, moving is temporarily off of the menu – we want the lad to grow up in a stable place where the faces and friends stay the same from birth until high school graduation, and even the trees and hills and seasons become familiar through the span of his childhood.

But Mr. and Mrs. Money Mustache have already got some more Adventure Moves planned for the many decades to follow in the future. Maybe we'll move to a different college town as part of helping our son earn in-state tuition in another state. Maybe we'll try Hawaii or another tropical island. I've always had a soft spot in my heart for San Diego.. but I also am fascinated by some expatriate destinations in Mexico like Lake Chapala near Guadalajara. Or maybe Victoria, on Vancouver Island back in the homeland.

You should live in whatever place works best for you. But you should be able to prove to yourself that it really is the right place – instead of just being the place you happened to be born.

Is a Costco Membership Worth The Cost?

By Mr. Money Mustache

Fri, 30 Sep 2011 12:12:14 +0000

Last week, I had a chance to indulge my usually suppressed Consumer Instinct and buy a WHOLE BUNCH OF STUFF at Costco.

The nearest outlet of that chain is about 20 miles away from my house, in a mostly-sprawl area called Superior, Colorado. If you know Mr. Money Mustache at all, you know that I would never drive that far just for a shopping trip, so I always wait until I have other business in the towns nearby such as Boulder. As a result, I usually get to Costco about once every 3-6 months, and when I do, I acquire a hatchback-busting $400 load of groceries and any other necessities that happen to be available at unusually low prices at the time.

A Costco membership costs $50 per year. And expanding a nearby errand does still add some extra driving to my trip – which would not otherwise be necessary since I get all my other groceries using a bike trailer. Am I fooling myself with this membership, or is it actually a good investment of my time and money?

To find out, I have conducted a Top-Secret Multi-Store, Inter-City Investigation – just for you.

I walked through endless aisles, took candid photos on my telephone, jotted down notes on scraps of paper, and then spent countless minutes typing all of the results into a spreadsheet to figure out The Real Deal.

SO NOW.. let's go line by line through my latest Costco receipt, and compare the cost for equivalent food from my local Safeway. You can see all of my purchases, judge for yourself whether or not they are practical or silly, and at the end we'll see how much I saved or wasted on the trip.

Item	Costco Cost	Safeway Cost	Costco Savings
Quaker Oats - 30 lbs in the form of 3 10lb boxes	20.67	45.00 (and this happened to be during a major sale)	24.33
Toilet Paper (100% recycled) - 32 double rolls	14.69	17.33 (but no recycled TP available)	2.64
Blackened Wild Salmon Filets - Frozen - 2.25lb	15.99	29.97	13.98
Organic espresso roast coffee - 4 bags totaling 9 lbs	48.00	75.96 (that was the cheapest wholebean coffee in Safeway. For equivalent quality, more like $100+!	27.96
18 organic eggs	3.69	5.98	2.30
3 lb organic beef burger patties	15.99	23.97	7.98
2 lb Kalamata Olives, fancy	6.79	11.97	5.18
TOTAL	**401.48**	**690.67**	**283.16**

Item	Costco Cost	Safeway Cost	Costco Savings
4lbs frozen mixed blueberries/raspberries	10.99	19.20	8.21
2lb sliced various kinds of cheese (party style)	8.99	12.00	3
8.5 lbs (4 x 2.1lb bags) Quaker Natural Granola	15.98	21.80	5.83
300 generic-version-of-flintstone kid vitamins	12.99	17.50 (happened to be 2-for-1, normal price is double this)	4.51
32 oz pure maple syrup	12.99	19.99	7
4 lb thick sliced smoked bacon	14.99	19.96	4.97
2 lbs roma tomatoes	3.99	3.99	0
16 dry erase whiteboard markers (for our little artist)	9.99	16.00 (Staples price)	6
3 lbs Boulder natural sausages	7.19	18.83	11.63
6lbs Whey protein powder (for the weightlifters in the family, also supplements protein for fussy eating boy)	39.99	59.99	20
3 lbs Coleman organic chicken breast	18.45	23.97	5.52
2lbs colby jack marble cheese	5.99	7.99	2
2.4lbs smokehouse roasted almonds	8.99	19.18	10.19
9 lbs (!) raw unsalted almonds	29.37	45.00	15.63
1.13 kg organic tortilla chips	4.39	12.00	7.61
5 lbs shredded mozarella cheese for pizzas	12.99	20	7
4 pack men’s merino wool hiking socks	10.99	17.00 (target price)	6.00
16oz pure vanilla extract	6.89	19.98	13.09
TOTAL	**401.48**	**690.67**	**283.16**

Item	Costco Cost	Safeway Cost	Costco Savings
3 lb Pico de gallo salsa, fresh	5.49	no yumminess equivalent, closest is Newman's Own at 2.69/lb = 8.07	2.58
2 lbs smoked turkey slices, fancypants	11.99	15.98	3.99
303 grams ground cinnamon	2.65	9.00 (6 x 50g containers, on sale)	6.35
3.5lbs dark bittersweet chocolate chips (70% cacao)	9.79	13.95	4.16
2 lbs active dry yeast (for bread and pizza making)	4.15	43.12 (5.39 for a 4-oz jar!? what the fuck, safeway?)	38.97
32oz extra virgin olive oil	5.44	15.99	10.55
TOTAL	**401.48**	**690.67**	**283.16**

I'm calculating this for the first time as I write the blog posting, so my first reaction is ***Holy Shit!*** My Costco habit is even more useful than I had been assuming!

Comparing the $401 Costco bill to a potential $690 Safeway bill means that I am saving 41% over the lowest prices I could find at Safeway – and this is over a huge swath of groceries. After subtracting the membership cost, I probably still save close to $1000 per year.

All of these things are food that we actually eat, and use up completely, so there is no need to factor in waste. I've been buying basically the same staples for years. The exact list varies slightly, as some of my staples hadn't run out yet and thus do not appear on this list, and some of the things I bought this week will still be around and not need replenishing when I return in December.

Of course, Costco isn't entirely comprised of great deals. You still have to watch yourself, and know how to spot good values and avoid poor ones.

There are always a few traps laid around the store.

Some things are ridiculously overpriced (a 2-pack of 6 foot HDMI cables for your computer or TV for 38.99 – the correct value of a 6-foot HDMI cable is about $2.00, and there are dozens to choose from at Amazon. My computer monitor is getting the signal I'm seeing right now from one of those very cables – works perfectly).

Other products are fairly priced, but stupid, like a stainless steel electric Turkey Fryer with carbon filter and digital temperature controls for $138.99. (WTF?)

The hardware and tools section is very-well priced, although the selection is minimal. Last year I bought a FatMax rolling tool chest for my carpentry business – it costs $80 at Home Depot, but Costco had them at $30. I also noticed that the size of car battery that fits my car is available at Costco for $68. I just paid $102 for the same model at AutoZone. Damn!!

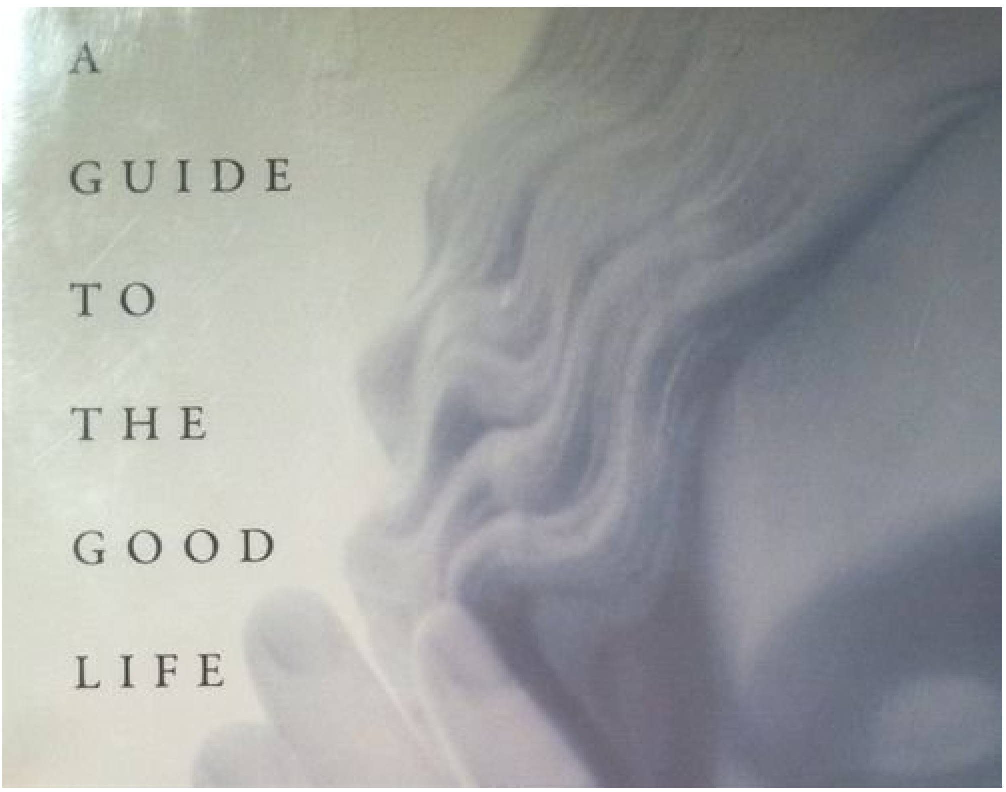
And still other products are tempting and well-priced, like a fancy digital weather station that measures wind and rain and connects to your computer and publishes your stats on the internet, for $80… but yet completely frivolous and unnecessary, because you can find out all the weather parameters you need by looking at the internet-reported values from your NEIGHBOR's digital weather station.

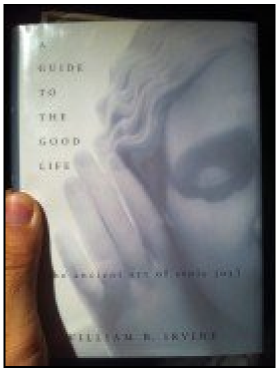
Overall, the ultimate value of Costco from a Mustachian perspective is this: drastically lower prices on many high-quality grocery staples. You just can't go wrong from a frugality sense, cooking your way through a 50-pound bag of rice that cost you only $18. Their prices are remarkably consistent around the country, so if you can get to a Costco, you can make grocery shopping in California almost as cheap as eating in Alabama. If you're having trouble getting your own grocery costs equal to or lower than mine ($75/week for a family of 3, even with plenty of luxuries like coffee and organic meat and fish thrown in), you might want to compare your own food prices to those in this article.

What is Stoicism and How Can it Turn your Life to Solid Gold?

By Mr. Money Mustache

Sun, 02 Oct 2011 18:36:35 +0000





A few weeks ago, I got a really interesting email from a guy in Norway that said something like, "Hey Mr. MM.. What you are preaching is Pure Stoicism, with a great twist and perception on today's world … I love it!!" *

"Stoicism?" I asked, "You mean like the Stoics in Shakespearean plays that show no emotion of any sort? That doesn't sound quite right to me.

But it turns out I had fallen into a common misconception. The Clever Norwegian pointed me to a book on the topic, which I immediately checked out of the library and read completely. It was called "A Guide to the Good Life, The Ancient Art of Stoic Joy".

From reading the book, I learned that Stoicism was actually a shockingly advanced old philosophy that found many followers in ancient Rome. Although it has fallen widely out of favor in modern life, people in today's society would probably identify the central ideas as "Hardcore Mustachianism".

Stoicism, in short, is a series of mental techniques and ways of life that allow you to decrease and then virtually eliminate all negative emotions such as anger, fear, anxiety, and dissatisfaction, while simultaneously building up a tide of pure Joy inside you that eventually starts to make you jump around and boogie at unexpected moments, and occasionally shout out "AHH YEAH!!" as discreetly as possible to yourself when the Joy overflows.

Sounds pretty good, doesn't it? But over the past few years, this is exactly the transformation that has been happening to me. As I learned from the book, every good Stoic is a work in progress, and I still have much to learn and I'm not free from all negative emotions. But compared to a normal person, things are getting pretty unusually joyful up in here.

So let's see what it's all about.

The core of the philosophy seems to be this: **To have a good and meaningful life, you need to overcome your insatiability**. Most people, at best, spend their lives in a long pursuit of happiness. So today's successful person writes out a list of desires, then starts chasing them down and satisfying the desires. The problem is that each desire, when satisfied, tends to be replaced by a new desire. So the person continues to chase. Yet after a lifetime of pursuit, the person ends up no more satisfied than he was at the beginning. Thus, he may end up wasting his life.

The solution, the Stoics realized, is to *learn to want the things you already have*, rather than wanting other things. The most interesting technique that will help you achieve this is *Negative Visualization*.

For example, suppose that you currently have a good working set of eyes. Imagine carefully what it would be like to live your life as a blind person. You would have to work very hard to rearrange your life to remain functional — learn braille, take special precautions when walking around town and when cooking eggs at home, etc. — but in the end, you could surely survive and even become happy again if you were blind. But now open your eyes. SURPRISE!! YOU HAVE THIS BONUS OF SIGHT!!!. Wow, you were already doing just fine in your blind life, but now you have working eyes too? What an incredible life – you are truly blessed with more than you even need.

It turns out that if you practice negative visualization on a regular basis, you learn to both appreciate your current life much more, and to be mentally prepared in the event of any changes in your life as well – loss of health, fortune, a loved one, etc. You have replaced negative emotions with satisfaction and even joy.

The next great trick is the one that allows you to eliminate anxiety about the present and the future. That can be done by separating your worries into things you can control, and things you can't. Some people worry endlessly about politics and world events – so much that it affects their ability to lead a happy life, even when in reality, world politics barely even affect their lives here in the cushioned and prosperous rich world! The Stoic solution to this is to realize that politics and the actions of other countries are completely outside of your circle of influence – so you can breathe easily and completely drop all worry about them. There is a smaller subset of these events that you CAN influence – who you vote for, and possibly where you donate your money or time. To eliminate the rest of your worry, make the votes and take the local actions, and then you can be 100% worry free.

Similarly, instead of worrying about your health as many people do, you simply work to the best of your ability to optimize the body you've been given, and the matter is completely closed – you can confidently move on!

As an unexpected bonus, we now know that it is the act of worrying itself that causes many of a modern person's mental and physical problems, so by eliminating worry AND taking action, you are providing yourself with a double boost.

Moving from the mental to the physical, Stoics actually enjoy experimenting with Voluntary Discomfort. As a contemporary Stoic, you might make a point of seeing how long you can leave the air conditioning off on a summer day, or try hiking in bare feet instead of shoes occasionally to feel the land and force your feet to adapt to tougher conditions than a moisture-wicking merino wool hiking sock. It sounds absurd by modern standards, until you realize that by doing this, you are actually broadening your comfort zone, even while you eliminate your fear of discomfort. Thanks to the practice above, you are now able to enjoy yourself in a much broader range of temperatures, and appreciate the comfort of shoes when you do have them. Meanwhile, a person with the extreme opposite philosophy might become irritated if he ever has to travel in less than a first-class airplane seat or stay in less than a five star hotel or drink sub-$500-per-bottle wine. By experimenting with voluntary discomfort, we learn to appreciate far more of our life, and can be content with a much simpler and more wholesome one.

"The more pleasures a man captures, the more masters he will have to serve"

Nature Itself told the Stoics what conditions they should learn to appreciate as humans – since they realized we are all in fact an integral part of Nature. In Mustachian terminology, all of these thoughts relating to adapting your comfort level to embrace Nature are collectively referred to as *Badassity.*

But there's much more to the philosophy than sitting around trying to be happy with what you've got. Stoics believe that the main purpose of our productive energy is to fulfill all of our life's obligations to our best ability, and to help our fellow humans. So a stoic is actually a hard-working person who enjoys the feeling of hard work – even extremely hard work, as it just falls into the "Voluntary Discomfort/Badassity" category described above.

Rewarding social interactions are a specialty of the Stoic. They believe that humans are social animals at the core, and thus we must exercise this part of our personality to maintain a balanced happiness. But at the same time, it is not rational to have any interest in fame or social status, since these are fleeting indulgences rather than sources of true happiness.

When we encounter insults from other people, we must deal with them with reason rather than anger. Either the insult is true, in which case we should be grateful for the insulter for pointing out this area in which we could improve, or it is false, in which case we should pity the insulter for his lack of accurate perception. Either way, an insult is nothing to get upset about. In the case of a True Fuckwit who not only insults us, but manages to commit major injustices to us, the best revenge is simply to live an even better life while refusing to be like that person. I have actually been through a major encounter with one of these TFs, and I while my initial anger took over a year to subside, I am happy to report that I am now exacting my "revenge" more thoroughly each day.

The core of all of these tricks and techniques is to *let reason triumph* over your reflexive emotions. By understanding human emotions and motivations as thoroughly as possible, Stoics are able to bend our evolutionary programming and use it for the purpose of attaining a ridiculous amount of happiness, rather than its original purpose, which is to survive and reproduce successfully.

For example, our insatiable desire for MORE of everything is not a moral failing on the part of humans. It's a natural evolutionary program, just as simple as the programming that makes even YOU raise an eyebrow when you see an unusually curvaceous and sexy butt. Ancestors of ours who were insatiable, and always wanted more mates, more children, more food, more social standing, and more security against predators and enemies were quite simply the ones who got to produce the largest number of surviving children. But while insatiability did historically lead to more children, it does not lead to more happiness in a modern life. For happiness, you have to trick yourself into being happy with the things you've got.

Last in my own miniature summary of Stoicism, I'd like to point out the difference between Pleasure and Happiness. An alternative philosophy called Hedonism suggests that to have the best life, you simply maximize pleasure. But Stoics reject that, since pleasure is just one dimension of true happiness. Eating cupcakes is pleasurable, as is sex, sleeping in, drinking wine, and watching TV. Higher level pleasures might be had by driving a fancy car for the first few times, receiving compliments from important people or having millions of people ask for your autograph. But each pleasure very rapidly wears out if overused, and the Hedonist is left scrambling desperately higher up the pyramid of earthly pleasures until he runs out of money or health. Meanwhile, by focusing on Happiness – the underlying signal delivered by Pleasure, the Stoic can make it a much more consistent and tranquil companion in his life. In our society as well as those thousands of years ago, the Stoics is truly the one who has Got It Goin' On.

And these days, he ends up becoming much richer as an almost-trivial side benefit.

* — Thanks Rolf!

Let’s Buy a Foreclosure Together! … Episode 1

By Mr. Money Mustache

Tue, 04 Oct 2011 11:56:06 +0000

 You and I are about to embark upon an adventure together over the next few months!

Have you ever wondered what is involved in buying a bank-owned home at a massive discount, renovating it back into nice condition, and then selling or renting it out at a highly profitable rate? Well, a friend and I are about to do just that, and I’ll be documenting everything right here on MMM so you can vicariously enjoy and judge our progress while you learn from the Masters.

All of us are well aware that the US housing market has been in a very funky state for several years now. Some people have treated this as source of fear, noting that their own house is now worth less than what they paid for it, and perhaps less than what they owe on it.

Other people (like me) have watched with some fascination as banks have offered up foreclosed homes at ludicrously low prices around their towns, and lucky investors have snapped them up within a day or two. With a wife who is a licensed real estate agent, and being an enthusiastic home builder/renovator myself, I typically run the numbers on each of these houses on the day it goes up for sale, determine how much profit could be made with a reasonable amount of restoration work, then sit back and watch as another investor buys the house and re-sells it a few months later, claiming the profit that I could have had if I had gotten off my own butt.

My excuses so far have been that "I don't really need to earn more money", "I don't want to compromise my family time with a big outside project", and "I insist on buying all future houses with 100% cash", because involving a bank, appraiser, insurer, and all of their attendant fees and delays tends to reduce the joy of real estate dealings for me. By sometime next year, I will have enough uncommitted cash to buy a low-priced home in my neighborhood and do everything my own way without a loan, so that's what I've been waiting for.

But in the mean time, I am missing out on some real FUN. I would love to be part of a big high-speed high-profit renovation project right now. The deals won't last forever (filings are down 50% from their peak here in Colorado, although it will still take a few years for banks to clear out their backlog). And with the rental market being quite strong these days, it's a good time to be a landlord.

It is fascinating to me to evaluate an old and junky house, then strategically design some changes that will dramatically improve the feel of the home."Open up this wall to expand the kitchen, paint the whole interior and exterior in clean and rich historic colors, add a big window here, rebuild this old bathroom, and add a second bathroom over in that back room". Things like that.

When you take the sale price of some of these bank-dumped homes, and then design a budget for any necessary renovations or restorations (many of them are in pretty scary condition due to months/years of neglect), and compare it to recent sales prices in the same neighborhood, the potential for profit is often huge. My own calculations show profits of $15,000 – $40,000 for a 6-month project, even after paying for the renovations separately. So the investor earns this amount purely for the process of buying, and later re-selling, the house. Alternatively, I've calculated about a 15-20% net annual return on investment if you put 20% down on a $115,000 house in my ‘hood, and then rent it out at market rates. (Now you see why Mr. Money Mustache is pretty confident about getting annual returns of 7% on his savings over time – because some of it earns higher rates like this!)

To help get my fix of the house scene, I’ve been helping an investor friend of mine in the neighborhood to find another rental house to add to his collection. We have rushed out and toured several houses on the first day they came to market, and made above-asking-price offers on the same day. But so far, we’ve been outbid every time. It’s because the banks are selling at unnecessarily low prices, and the other investors who are competing with us know it too. Each investor tries to out-guess everyone else by offering more than the asking price, but still enough below the actual market value to ensure a healthy profit margin. We have failed to win this mental lottery so far.

But this week, it looks like we got lucky.

On September 2nd, a bank-owned home came up only three blocks from our own houses. My friend and I both live in a mixed historic neighborhood where the fair market value of houses ranges from $150,000 for an unsightly shack up to perhaps $500,000 for a stately 5-bedroom victorian brick house. Sales have been plodding along steadily since the housing crash – in our area, we never got the mid-2000s boom, and we barely got the subsequent bust. And it is probably the most desirable neighborhood in the city, with limited supply and gradually increasing demand making it one of the most stable housing markets around. Families and stylish hipsters want to buy the houses that are already in nice condition, but only us grungy contractor/investor types are competing for the dumps, which gets us some good deals.

The house in question is above the “shack” level, it could probably be considered a “historic cottage”. It’s about 80 years old, with 2 bedrooms/1 bathroom, 900 square feet, on a really nice large lot with trees, an awesome back deck with hot tub, and a detached 1-car garage facing an alley. Fair market value as assessed by the city: $180,000. Bank asking price: $110,000. Current cosmetic and maintenance condition: Very Shitty.

My friend made a bid on the house at the full $110k. It was rejected by the bank – they had other offers. He raised it to $115k. Still rejected.

Two weeks later, the bank came back to us – the first sale had fallen through as the buyer backed out. We re-iterated the $115k offer — and got it!

This house will generate a hefty profit for my friend – and since I'm investing a portion of the purchase price and doing some of the renovation work – some nice profits for me too. Here is my forecast for how things will work out.

Purchase Price: $115,000
Renovation materials and labor (the place needs a new bathroom and a kitchen upgrade, plus plenty of paint, some roofing, and landscaping): $25,000
Total Cost after upgrades: $140,000

Annual Property taxes and insurance: $1600
Expected annual rent @1100/month: $13200
Net annual cashflow: $11600

This is an annual capitalization rate 0f 8.3% after expenses. Quite good for a single family rental house. We're buying the house with old-fashioned cash, with a portion of it being from me.

Just for comparison, here's how the numbers would work out for someone buying this house with a traditional 80% loan at 4.5%, rolling in the renovations and additional closing costs that typically come with a loan:

Total Purchase cost: $145,000
Down Payment: $29,000
Amount financed: $116,000

Monthly carrying costs:
Interest: $544 Principal $191 Property Taxes and Insurance: $150
Total payment: $885
Monthly Cashflow: $215

Monthly profit including principal paydown: $406
Annual profit: $4872

Annual return on $29,000 of capital invested: 16.8%!

Note that since both the value of the house and its rental income will on average go up with inflation, this is actually a **16.8% inflation-adjusted return**. Of course, you do have to take care of tenants and keep the place occupied and avoid vacancy, but after doing this for many years my friend and I are both comfortable with the trade. On an hourly basis, it is very highly paid work.

This is just the first installment in this dramatic series. The closing date for this sale is October 25th. On that day, we could turn around and re-list the house without any changes for an instant sale at around $140k, but instead we will dig into it and transform it from Zero to Hero in about two months, then find a responsible tenant to move in!

I'll publish before, during, and after pics and describe some useful projects we're doing within on a series of MMM articles. We can cover things such as how to re-build a bathroom and a kitchen, how to do your own plumbing, interior design techniques, how to advertise a rental house, and surely many more as we go through the house.

Since this is the Mr. Money Mustache blog, we will be doing it all with an eye for Ultimate Efficiency – creative use of materials and design, using nearly-free supplies from the recycled building materials yard when possible, and a 100% Insourcing model with respect to doing the work.

It will be loads of fun. And it may even inspire some of you who were on the fence, to take the plunge into house-related profits in one way or another. Maybe renovating your own house, or buying your first one, or owning your first rental property.

Update: Here's a Neat Spreadsheet for analyzing rental house income, emailed by a reader as part of the discussion below. SFH_Rental_Analysis

Next update: October 25th Closing Day!

The True Cost of Commuting

By Mr. Money Mustache

Thu, 06 Oct 2011 12:28:53 +0000

 It was a beautiful evening in my neighborhood, and I was enjoying one of my giant homebrews on a deck chair I had placed in the middle of the street, as part of a nearby block's Annual Street Party.

I was talking to a couple I had just met, and the topic turned to the beauty of the neighborhood. "Wow, I didn't even realize this area was here", the guy said, "It's beautiful and old and the trees are giant and all of the families hang out together outside as if it were still 1950!". "Yeah", said his wife, "We should really move here!".

Then the discussion turned to the comparatively affordable housing, and the other benefits of living in my particular town. By the end of it, these people were verbally working out the details of a potential move within just a few months.

Except their plan was absurd.

Because these two full-time professional workers currently happen to live and work in "Broomfield", a city that is about 19 miles and 40 minutes of high-traffic driving away from here. They brushed off the potential commute, saying "Oh, 40 minutes, that's not too bad."

Yes, actually it <u>IS</u> too bad!

But this misconception about what is a reasonable commute is probably the biggest thing that is keeping most people in the US and Canada poor.

Let's take a typical day's drive for this self-destructive couple. Adding 38 miles of round-trip driving at the IRS's estimate of total driving cost of $0.51 per mile, there's $19 per day of direct driving and car ownership costs. It is possible to drive for less, but these people happen to have fairly new cars, bought on credit, so they are wasting the full amount.

Next is the actual human time wasted. At 80 minutes per day, the self-imposed driving would be adding the equivalent of almost an entire work day to each work week – so they would now effectively be working 6 days per week.

After 10 years, multiplied across two cars since they have different work schedules, this decision would cost them **about $125,000 in wealth** (if they had for example chosen to put the $19/day into extra payments on their mortgage), and **1.3 working years worth of time, *EACH*,** spent risking their lives daily behind the wheel*.

That's EVERY ten years. And that's with a commute that most Americans claim is "not too bad".

You'll note that most 30-year-old couples today, about 10 years into adulthood, don't even have $125,000 in net worth. And they probably drive around quite a bit in expensive financed cars, mostly as part of a self-imposed commute. These facts are directly related!

The alternative I would have recommended to this couple, if they had asked my opinion, would be to make sure their house is within biking distance of both jobs, immediately sell both borrowed cars and replace them with a single ten-year-old manual transmission hatchback, and finally, let the good times roll. Setting aside $10k to keep the new car on the road, they will certainly enjoy their $115,000 of extra cash after ten short years, and if they combine this trick with a few of the other MMM classics, they'll be able to move to historic old-town Longmont as EARLY RETIREES within ten years, instead of being broke wage slaves still commuting out of here every morning when the year 2021 rolls around.

Now, I will admit that it *is* possible to bring your cost per mile down somewhat. That's one of my own specialties, which is why I still keep a car of my own around for affordable family roadtrips. If you buy the right car for $5,000, you might be able to squeeze 100,000 miles out of it with no major repairs. In this case the car depreciation is 5 cents per mile.

Gas, at $3.50 per 35 miles (assuming 35MPG), is 10 cents/mile
Tires, at $300 per 50,000 miles are 0.6 cents
Oil, at $25 per 5,000 miles is 0.5 cents
Miscellaneous things like wipers and occasional maintenance visits: $200 per 20,000 miles = 1 cent

So the *ultimate cheap driving* in a paid-off economy car still costs at least 17 cents per mile. Most people cannot drive this cheaply. And this is ignoring the cost of insurance since I'll assume you'd have a car even if you didn't commute to work. Most people aren't willing to go completely car-free (although if you are, good for you!).

Besides the option of picking a *home* close to wherever your *work* happens to be, there may also be the option of picking a *job* that is close to your *home* in the town of your dreams. Get a new job! (There are apparently plenty of them here in my own city, many being worked by people who commute in from other places, even while an equal number of people commute OUT of my town to work somewhere else).

But despite the availability of both of these options, the idea of living close to work still seems to be completely alien to most people I've met. While I would personally consider it far more important than even the salary or the work performed, most people put commute distance below house price, perceived school quality, and neighborhood preference. With such a low threshold placed on commuting, most people don't even put a reasonable effort into creating a nice local lifestyle for themselves. As you saw with the couple in my example above. They were willing to go from their existing negligible commute, to an Insane Asylum 80 minute round trip, just because they liked the scenic and neighborly vibe of my neighborhood.

"Schools" are often used as an excuse as well, but until you've reviewed every close-to-work school personally and interviewed the principal, you might be making quite a bad trade-off for your kids. What's better – higher standardized test scores and more rich kids, or real-world diversity and an extra two hours to spend with Mom and Dad every day reading books? And how about an extra $300 grand or so towards the college fund, that you didn't burn up in cars and gas during her school career?

To put things back on par, let's whip up a couple of quick commuting equations. Let's assume the average person's marginal driving cost is halfway between the Ultra-Mustachian driver figure of 17 cents per mile, and Uncle Sam's generous 51 cent allowance. So, 34 cents. Let's also assume the value of a person's time is $25 per hour, since this is close to a median wage for a suburban commuter. (If you don't think you'd use your newfound leisure time that productively, you need to think more like an Early Retiree. I used mine for plenty of learning and domestic insourcing).

For each mile you drive across two times on your round trip to work daily, it multiplies to 500 miles per year, or a $170 annual fee
For each of these miles, you waste about 6 minutes in the round trip, adding to 25 hours per year ($625 of your time).

So each mile you live from work steals $795 per year from you in commuting costs.

$795 per year will pay the interest on $15,900 of house borrowed at a 5% interest rate.

In other words, a logical person should be willing to pay about $15,900 more for a house that is one mile closer to work, and $477,000 more for a house that is 30 miles closer to work. For a double-commuting couple, these numbers are $31,800 and $954,000.

Adapting the numbers for a $7.50 minimum wage earner, each mile of car commuting cuts $1.43 from your workday. If you drive 10 miles to go work a 5-hour shift at the Outback Steakhouse, your effective hourly wage is more like $5 per hour after subtracting car costs and adding drive time.

And these are all numbers for the United States, where cars and gasoline are much, much cheaper than they are in almost any other country. In Canada, you can add 30% to the gas prices and 50% to the car prices. In the UK, still more.

If these numbers sound ridiculous, it's because they are. It is *ridiculous* to commute by car to work if you realize how expensive it is to drive, and if you value your time at anything close to what you get paid. I did these calculations long before getting my first job, and because of them I have *never* been willing to live anywhere that required me to drive myself to work**. It's just too expensive, and there *is always another option when choosing a job and a house if you make it a priority*.

And making that easy choice is probably the biggest single boost that will get the average person from poverty to financial independence over a reasonable period of time. I would say that biking more and driving less was the trigger in my own life that started a chain reaction of savings and happy lifestyle changes that led my wife and I to retirement in our early 30s.

Now, all this doesn't mean you have to set up a tent on your employer's front lawn to avoid going broke. Public transit, although an afterthought in most of the US, is great if it's available to you, because you get your brain and your hands back for the purpose of getting some of your day's work done while enroute.

But if you can walk or bike to work, it will cost you virtually nothing. And it also doesn't count as using up your personal time because it is adding something that nobody except Olympic athletes is doing enough of anyway – exercise. You can take your time spent riding your bike ride directly out of time you would have otherwise spent in the gym, or waiting in the doctor's office for prescription medication.

So there's my answer for this potential new set of neighbors. I'll see you in ten years!

And now that the truth has at last been revealed about the foolishness of commuting, I'm looking forward to reading about the empty interstates and bicycle-filled streets tomorrow morning.

** Note that I wrote this whole rant without bringing up that whole pesky "destroying the entire Earth" issue, since that part is controversial in the United States.. so I figured it's best just to focus on making you rich :-)*

*** For the Record, I grew up in the Great Lakes area, on the Canadian side about 1 hour Northwest of Buffalo, NY. Then I spent a few years in an area much colder – Ottawa, Canada, with a climate slightly worse than Minneapolis, MN. Biking year-round in these conditions was completely feasible (and even fun), and I'll do a post on how to enjoy winter bike commuting later this fall!*

**** Also for the record, my wife and I still bike year-round here in Colorado, including for grocery shopping and dropping our Kindergartener off at school – thanks to the magic of bike trailers. Do a search on your [local Craigslist]() and change your biking life.*

How to Tell if You're a Complainypants

By Mr. Money Mustache

Fri, 07 Oct 2011 19:35:45 +0000

When I read an article about an olympic athlete who can swim further and faster than I can even run, I don't immediately find his blog and write a complaint that he is training too hard and failed to take into account time for commuting, chronic illnesses, or TV watching in his lifestyle.

When I was a teenager sitting in the Mac's Convenience store reading bodybuilding magazines that described the mindset and methods that allowed Arnold Schwarzenegger and Lee Haney to each win seven consecutive Mr. Olympia titles, I didn't write to those Muscular Mustachians about why I couldn't accomplish those things either.

When I read newspaper articles about the Fifty Billion Dollars that Warren Buffett has earned for his company by being the world's greatest investor for fifty straight years, I don't jump into the comments section along with the General Wussypopulace and complain that Warren has led an evil life and doesn't understand the plight of the common man.

And when I read Early Retirement Extreme, where Jacob has for several years described the mindset and techniques that allow him to live a very fulfilling life on about $7,000 per year, I don't angrily write him a comment about how he has failed to include certain mandatory expenses in American life and is therefore misleading his audience.

And when their asses are saved by Superman, the people of Metropolis and the surrounding region don't get mad at him and say, "Well, fine, Superman, it was easy for you to freeze that lake with your breath and then fly it over to the burning oil refinery where it melted to cause rain to extinguish the fire. But what about all us regular firemen, we have warm breath and are stuck with standard firefighting equipment – we're going to post complaints on your blog!?"

No, when I hear about someone who is doing something better than me, even if the details of his choices or genetic abilities differ slightly from my own strategy, **I bow the fuck down and respect his innovation and acknowledge that I have so far failed to achieve his level of badassity. Then I secretly try to learn from his success.**

Because of this tendency to want to learn from people who have unusual skills, rather than try to talk them back down to my own level, I am going to postulate that I am **NOT too much of a Complainypants.** I already know that there are millions of people out there who are better than me in every measurable way. And I hope to continue to learn from them. And this ability to learn from (rather than become frustrated with) people who are good at various things, brings an extra dollop satisfaction to my life every day. Many of the non-complainers in the audience surely feel the same way.

So why, the fuck, do people like to write to Mr. Money Mustache EVERY DAY and tell him that he has failed to take into account certain things in his lifestyle or retirement strategy, and thus is writing this blog on fraudulent pretenses??

No, I haven't failed to take anything into account! Yes, I am fully covered for inflation, education, health, fun, shelter, retirement, old age, and everything else that is easily foreseeable in a standard middle-class life. And yes, situations change, and I'm fully covered for changing situations as well – because of the exact same thing that covered me for the things above – ADAPTABILITY. If your life situation changes, you can change your strategy. That's called "solving a puzzle with your mind", which happens to be the most fun and useful thing you can do with your mind anyway.

So why, the fuck, is everybody afraid of unknown situations and change? If anything, people should be afraid of *lack of change*. I've solved the relatively simple puzzle of reaching Early Retirement in a capitalist system so early that I actually have a shortage of puzzles right now. I'm struggling, just a tiny bit, with a lack of challenge in life, and as a result I'm sitting here on a sunny weekday morning in my basement office with no shirt on like a lazy slob, typing to you, procrastinating on doing the second half of my workout. I should be out accomplishing something bigger right now. There's not enough change in my life, not enough puzzles to solve, and I am about to get off my ass and find some new ones to tackle*.

So, to get back to the point of this article – if you read all this and chuckled and said, "Heh, heh… Yeah! Listen to Mr. Money Mustache, tellin' it like it is again! I'm gonna go solve a few of my own puzzles right fuckin' now so I can wake up tomorrow even further ahead", then congratulations, you are a Mustachian, not a Complainypants.

If, on the other hand, you read the paragraphs, and stuck out your lower lip and said, "Oh, listen to that self-aggrandizing thirtysomething who has led a privileged life and doesn't understand real hardship like I do, because of the following reasons I have it harder than him", then guess what – you are still a Complainypants. Keep working on it, sucka.

A Complainypants looks only at results – seeing the external trappings or the successes of a particular role model's life, and justifies why he can't have those things. And then makes himself unhappy because of not having those results.

Instead, the Complainypants needs to think about the *reward of puzzle-solving*. It's not the results that make you happy, it's the using of your own mind and skills to *advance your own cause*. You won't get any further telling me that I have failed to account for your particular life's situation in my blog.

You <u>will</u> get further by figuring out how to solve the situation for yourself, and then writing in a comment telling us how you solved it in an innovative way, so we can all be awed by how you have out-badassed Mr. Money Mustache!!!

So let's hear it.

*Luckily, the Foreclosure Project starting in just over two weeks will be one of those.

Let’s Buy A Foreclosure Episode 2 – What is the 50% 2% Rule?

By Mr. Money Mustache

Mon, 10 Oct 2011 12:13:59 +0000

 bank-owned house down the street, a comment came in on that first article in the series. A guy named Joe told us this:

> “This house is cash flow negative with 100% financing (and the many issues you are ignoring like maintenance/repairs, vacancy, management, etc), meaning forcing cash flow by paying cash is a low return on your investment.”

“What!?”, I thought, “This is the best rental house I’ve ever seen so far in my own area!”. I wrote a big **BZZZZT, WRONG!!** comment to him in response, which I will now admit was actually a Complainypants move on my part. Also, it was midnight on Friday at the time. And I was drunk. I did, lucklily, ask him to elaborate further, and he shared an enormously detailed comment which I have brought in to become the subject of this article!

While I still disagree with the wording of of Joe's comment (I'll present an alternate way to express it later), it turns out he is part of a Secret Badass Bigtime Landlord Community – something that I didn't even know existed until he told me about one of the forums where they gather – a website called Biggerpockets.com.

Badass landlords are people who are even better at making money from rental houses than me – and therefore I must bow down and listen to their ideas rather than rejecting them because they know something I don't. These are people who deal with the stuff so much, that they call a house an "SFR", and they have so many rental units, they refer to them as "Doors". They rack up these metaphorical doors faster than I can install finely crafted physical doors, and with the right techniques they can end up with nearly unlimited cashflow and equity over time. Here's what Joe wants to tell us:

> Okay, I'll explain.
>
> There's something called the 50% rule and the 2% rule. There are many, many discussions, evidence, etc. on BiggerPockets for these two rules of thumb. I won't go into detail to back them up, I'll just explain them. I assume you can use Google or their forum search to find the, literally, dozens of threads discussing them.
>
> The 50% rule says that over time, 50% of your gross rents will go towards ALL your expenses. This means taxes, insurance, maintenance, repairs, vacancy, management, etc. etc. Obviously some areas have higher taxes, some houses will have lower maintenance, and so on, but studies and tons and tons of anecdotal evidence (from hundreds of people with hundreds of properties) have shown that about 45-50% of gross rents go to cover all that.
>
> So the first problem with your post is that you are way under accounting for repairs and maintenance by spitballing a number. Sure, your personal residence doesn't have that much per month (because you take care of it and fix a small problem before it becomes big), and maybe you've had great tenants in your other house. But the wear and tear tenants can make can be huge. When you have to replace the carpet for $2k when a tenant moves out, or repair holes in the wall,

that can get expensive. No, the security deposit that they tried to use as the last month's rent (so they didn't pay that month's rent) won't cover that. Yes, you can get a judgment against them, at lots of time and hassle. Good luck trying to collect.

Will this always happen? NO! I've had GREAT tenants so far. Do I account for these things due to knowing many, many, many other landlords deal with it, and I will have to eventually? YES.

The second problem is you haven't accounted for vacancy: the months where it sits empty.

The third, and maybe biggest, problem is that you're way undervaluing your time.

See this recent Get Rich Slowly article:
http://www.getrichslowly.org/blog/2011/10/07/remember-to-value-your-time/

And in YOUR recent commuting article, you put someone's time at $25/hour. I manage my rentals… but when evaluating a deal, I always calculate in the cost of someone ELSE managing them. Then when I do it, I make more money, sure, but that's not a higher return on my investment. That's a side job as a property manager. You aren't calculating in any management costs, therefore you are valuing your time at $0, and putting the "profits" of your management side job into your overall return and claiming an 8.3% return. Further, rehabbing it will take time. You count in the cost of materials and the purchase into your total expenses to calculate your return, but again, not any of your time. Calculate what it would cost to HIRE someone to do the rehab you're going to do, then do it yourself, but count that amount that it would cost WITH the cost of materials and purchase price to actually value your time.

On to the part I mentioned about this being cash flow negative. With the 50% rule, you take 50% of the gross rents off for expenses. Then you calculate the property at 100% financing. If it cash flows then (usually most investors want at least $100/unit), then you're good. If it's not cash flowing at 100% financing, then you're essentially FORCING cash flow into the deal by paying more for financing. For example, if it's cash flow negative at 100% financing, and break even at a 20% down payment, you wouldn't want to put 30% down and go "Hey! I'm cash flowing $50/month, this is a great deal!" because you forced it to cash flow. You then could purchase it 100% cash and say "Hey! I'm making $300/month, great!" when in actuality you forced te cashflow in, so you're getting less of a return than you would putting the money elsewhere.

Now do I have anything against a cash purchase? Heck no! I'm in escrow right now on a cash purchase for a SFR. But run your calculation AS IF you're getting 100% financing, even if you aren't, to evaluate it.

So let's run the numbers on yours. You likely aren't getting 4.5% right now as an investment (non owner occupied) home. Likely more like 5%.

Cost (with rehab): 140,000.
Annual rent: 1320.
50% rule: 6600 will be your cash flow.

The monthly payment on a $140k loan (this is counting the rehab, not just the 115 purchase price, because then you're putting your own money in, and we want to compare as if you put no money in so you aren't forcing cash flow) is: 751.55. This doesn't count taxes or insurance (which are typically included in a mortgage payment) because those are counted already in the 50% rule. 751.55 x 12 months = 9018.6 per year in principal and interest. You're losing 9018.6 – 6600 = 2418.6/year. The novice investor would go "1100 rent – 751.55 mortgage = 348.45 cash flow!! YAY!!" They forget all the other expenses. You at least added in taxes and insurance. But you forgot all the other expenses beyond those. Now sure, most months that investor WILL bring in an extra $350ish. But then a pipe bursts, and they have to pay $1500 to repair it. Then the tenants move out, and they have to spend $800 getting it move in ready. Then it sits vacant for a month, costing them $1100 in rent. ANd so on, until they end up losing approximately that 2418/year (it may even take a few years, when they have to replace the roof, or whatever). But long term, over time, 50% of your gross rents go to costs. Now YOU, MMM, paying cash, will immediately see cash flow. And it will make you money over the year, because you forced cash flow into it. You could be earning more on that money elsewhere. Your real return would count in all those other expenses (including management, which IS calculated into the 50% rule), to show a cash on cash return of 6600. That's a return of 4.7%/year, and is not counting the rehab labor (or the denominator of 140k would be larger by that amount of the cost of the labor).

An 8.3% cap rate, without counting vacancy, way underguessing maintenance, and not counting management (plus any utilities that will be owner paid, like sewer), is way too low for the hassle you're getting. This is not a deal. You CAN find a deal, however. Today's market is amazing. This is not it. Your cap rate should be at least 10-12% when counting the above things you missed, even in a cash purchase (easily double that with financing).

The 2% rule says, roughly, that you should be able to get 2% of the purchase price per month in rent. It doesn't mean to CHARGE that much in rent (because then your property will sit empty, as people won't pay above market rates), but find what houses rent for there. If the purchase price is more than 50X that rent (50X is the inverse of 2%), you're overpaying. If your house will rent for 1100/month, you shouldn't pay over 55,000. Now that one is hard to do, and many are a little more lax on that. I personally shoot for a 1.5% rule on single family homes and 2% rule on multiplexes. But basically your house purchase fails all the rules of thumb of real estate investors.

You might argue that this is different, the 50% rule won't apply to you, your house won't have as much maintenance, taxes are low in your state, etc etc. And that's fine, you might nitpick numbers here and there. Whatever. My point is that you are way underestimating some costs, and that your return is negligible with this "deal". (And if hundreds of people have come up with the 50% rule independantly, maybe look more into it before arguing against it, like the whineypants would immediately do. Literally dozens of forum threads with hundreds of comments discussing it.)

You mention in your comment: “But I know many millionaire landlords, including myself, who have gotten quite wealthy with properties with considerably lower cap ratios than the one described in this article.” Sure, with appreciation. With markets poised to stay low for quite a while, cash (flow) is king.

This article is dangerous, because you’re telling your many followers this basic math is valid:
“Annual Property taxes and insurance: $1600
Expected annual rent @1100/month: $13200
Net annual cashflow: $11600”

You took your rent, subtracted off taxes and insurance as your ONLY expenses, and said that was your cash flow. But you didn’t account for all of the above. YOU can handle getting it rented and managing it, cause you’re retired. YOU can handle all the repairs, cause you’re fucking MMM. But you’re valuing your time at 0 then. But what about your readers that can’t handle repairs? Can’t do management? They’re suddenly losing money on this deal. That’s just dangerous for anyone reading this and not knowing enough (e.g. EVERY above commenter).

Plus what about vacancy, with even your MMM skills can’t totally avoid? The one month it sits empty costs you $1100, GREATLY reducing your cap rate.

Again, 8.3% at 100% cash without accounting for many, many things, and paying yourself 0 on rehab and management is forced cash flow. Bad.

I’m not a complainy-pants. I’m very bullish on Real Estate. But there are better deals to be had.

> I doubt you'll listen to this. You are excited (and should be!) about this new, fun project. You have a partner you don't want to let down. You're already in escrow, and likely already paid for a home inspection, and possibly appraisal. (Any earnest money deposit you can definitely, 100% guaranteed get back right now, don't worry about any EMD you've paid to a title company.) You've told all these readers, who you don't want to disappoint. Likely you'll plow ahead and get some cashflow from it, less returns than you could on a better deal, but hey, you don't need the money, so it's not a big deal. Hope you do consider it and read more. I have some good real estate books I could recommend.
>
> Sorry if this comment was a little repetitive, there was some things to hit from different angles and reasons. Hope you got something out of it.
>
> And again, would be happy to discuss more. Sorry to burst your bubble, cause it is such an exciting project, and you're usually right about things, so I'm sure it sucks to be wrong. I haven't experienced such a thing yet, but I feel for you.

—–

First of all, nice work Joe. You made fun of Mr. Money Mustache and lived to tell about it, *and* brought up some very good points . I am still Super Effing Excited about this particular deal, and I am more confident than ever about its profitabilty, but I've learned quite a bit from your Fancy Landlord Community, and we do need to add some cautions to help prevent beginners from getting in over their heads.

Let's start with how I would have written the critique, knowing both sides of the argument now:

> "Dear Mr. Money Mustache.. this sounds like a fun project, but did you know that it would actually be considered "cashflow negative" using something called the 50% rule that large-scale landlords use to evaluate properties? This is mainly because most landlords experience much higher carrying costs than the ones you described in this article."

First of all, I do have some immediate corrections to your assumptions that brighten the picture.

For the renovations, the $25,000 number I budgeted is not just for materials. That's the all-in number, paying for materials AND paying myself a generous $35/hour for construction work, as well as paying a separate painting crew (my investor friend also runs a small painting company) for the extensive paint work.

Regarding ongoing maintenance costs for the house – this is a place where I do benefit from being "fucking MMM" as you so aptly put it. To a large-scale landlord who refers to properties as "doors", a rental property is just a black box, where you put in monetary input to get an expected output. For me, a house is a living and breathing work of art. I feel the grip its foundation has on the soil, and the strength of its wooden skeleton and backbone as they flex when people walk across the floors. I hear the breath of its furnace as it sucks in outside combustion air and exhausts steam out the flue and circulates the heat extracted from natural gas around the interior. I feel the congestion when the house gets atherosclerosis in its supply or drain pipes and I lovingly slice out the damaged bit of its circulatory system and splice in a clean system of PEX and ABS piping which will last another hundred years.

Because of this, maintenance costs me very little. Just as I live a middle class lifestyle on 75% less than a comparable large-scale consumer, I think a Mustachian can make much more from any given rental house than an average landlord. I never assume my labor will be free – I do budget in paying myself at an hourly rate that would be $70,000-$80,000 on an annualized basis. But when it comes to repairing a house – your own or one of your rental houses, in many cases it is *drastically* cheaper to do things yourself. I can hire a furnace company to replace my furnace for $4,000, or I can buy a kickass 90%+ efficiency furnace online for $995, and install it with 8-12 hours of labor (under $500 which I gleefully "pay" to myself). I remember receiving a $1200 quote from a plumber to replace a 12-foot run of clogged cast iron pipe from a toilet to the rest of the drain system. This is about $35 of materials and 4 hours of work.

There are simply no expensive mysteries in a rental house when you enjoy home maintenance. For example, you used the example of a $1500 burst pipe repair. Coincidentally, this rental house came with THREE burst pipes which I discovered when doing the inspection. We repaired them in 5-10 minutes just in order to test the rest of the plumbing. As part of the renovation, I'll be replacing most or all of the *entire supply piping system* with nice clean burst-proof PEX pipes, for only a few hundred dollars in materials and labor.

I could go through the other issues of the management budget and the vacancy rate, but damn, this article is already over 2600 words! So let's wrap it up with a summary:

Joe has a great point – if you follow his 50% rule, it will lead you to *only* buy fiercely profitable rental properties, because you'll insist on getting the property at an incredibly low price.

However, this rule, and its partner the 2% rule, mean you're looking for a $100,000 house that you can rent for $2,000 per month. Or that my other rental house, worth about $480,000, should be getting me $9600 in rent each month. The $9600 figure is Not Gonna Happen in my town, or even in the entire United States, seeing how you can rent a 4,000 square foot seaside compound in Hawaii for that price. I've watched *every* listing and property sale in my neighborhood for about six years. This particular deal is probably in the top 1% in terms of value for the money, which is why there was such fierce competition from other investors and potential homeowners for the house.

You're more likely to get these kinds of price-to-rent ratios in very low-price areas (deepest foreclosure-hit neighborhoods in Las Vegas or Florida), or with higher multi-unit buildings. Which is exactly what the Big Time Landlords are suggesting you do!

So why is the MMM approach different? Because it's a small-time, holistic approach. I'm not interested in owning 10 or 100 rentals, just as I'm not interested in earning $10,000 per month in retirement income, or ever accepting a job that requires sustained car-commuting. I like to do everything in my life myself, or with friends, and I don't outsource anything. This lowers my peak efficiency in dollars-per hour, but I feel it greatly improves my average efficiency in Laughs Per Day. By learning as many skills as possible, you gain adaptability that pops up throughout the rest of your life in the form of unexpected opportunities, solutions to problems, and ways to save or earn money for yourself and others.

I am interested in going through this project where we will practice a huge variety of skills, from general market research and Landlord Theory (which we're doing right now), through the various stages of materials shopping, interior design, and renovation, up to the marketing and tenant interviewing process.

Then it's up to you, if you want to hold out for higher-cashflow houses or apartment buildings, or make a project out of a less-cheap house right in your own area as I'm doing.

My friend and I have over 25 property-years of rental house management experience together, and we've been through several dozen successful tenants, as well as an educational number of disastrous ones. Not as many as the Biggerpockets landlords, but enough to know how to continue building our 'Stash nicely.

So the project goes on – 15 days until closing!

** What's that photo? No, it's not the house we're buying (alas, you can't get a giant victorian beauty like that for 115k in my town). Just an in-progress shot of the latest vibrant and high-end paint job from my painter friend who is the main investor in this project. Hopefully the little rental house ends up with a similarly cool paint scheme.*

Avoiding Ivy League Preschool Syndrome

By Mr. Money Mustache

Wed, 12 Oct 2011 12:12:02 +0000

Better Parenting with Hot Glue

One of the big inspirations for my recent article on Complainypants Disease was the comments section of a mainstream newspaper article about some semi-early retirees that was recently forwarded to me by a few readers.

Don't waste your time reading through more than a few of the comments, because they'll make you punch a hole in your computer monitor. There were about 500 of them at the time of writing, and at least 75% were written by Ultracomplainers expressing some version of the following message:

> "What!? These people are lying about being retired!!… and besides, the only reason they could do this is **because they didn't have any KIDS!!!** Waaah! Waaaah!".

The funny part is, the article was about a couple who lives on close to $40,000 per year. By my standards, that is a lavish Prince Alaweed bin Talal lifestyle, seeing how my own family WITH a kid leads a guilt-inducingly fancy lifestyle with a current annual cost of about $24k (plus the implicit subsidy of having our house paid off).

So why do people think kids are so expensive to raise? They weren't expensive to raise for most of the history of our species, or even most of the tiny slice of history since the Industrial Revolution. But now, all of a sudden people think it costs a million dollars to raise a child, which is equal in most of these *U.S. News* commenters' mathematically challenged minds to "a million dollars per year", which is also equivalent to "more than anyone can afford, regardless of income, Waaah, Waaah!".

I believe this misconception is due to a disease spreading through the middle class that I call "Ivy Leage Preschool Syndrome".

In earlier times, parents considered themselves lucky to have enough food from their own farm's harvest to feed their children. Even more fortunate parents had time to allow their kids to attend the one room schoolhouse and get a job that paid more than farming. Public schools improved and work modernized, and pretty soon every kid went to school. Women dramatically increased their participation in the workforce and with perfect timing, consumer culture dramatically expanded the material desires of these parents to allow the increased family income to be poured into more luxury spending disguised as necessities – instead of more leisure time.

And now, here we are, when today's parents believe they *need* a 7-passenger SUV for the "safety" of their children, they *need* to take trips to Disneyland for family entertainment, and they *need* to put their kids into exclusive private schools and even fancy preschools, as well as horseback and violin lessons from trained professionals in various surrounding towns, in order to keep them ahead in *"the increasingly competitive world out there"*. By pure coincidence, all of these needs happen to be very expensive ones that clever entrepreneurs and companies are making a lot of money from.

Did you ever notice how you never see a strong international trend of parents spending *more time* with their kids, or people canceling their TV service and reading more, or local parks and natural areas becoming increasingly flooded with parents playing with their children? Hmm.. why is this? Is it because we've learned that these activities are not good for our kids so we have wised up and replaced them with organized and expensive activities? Or is it because *nobody is making money off of these alternative ways and nobody gets to look rich doing them, and thus the Marketing and Social Competition Engine is not tricking us into doing them?*

Mr. Money Mustache is once again going to be the first one to fart in the quiet room by saying, "IT'S ALL BULLSHIT!!! YOU DON'T HAVE TO SIGN YOUR KIDS UP TO DO EXPENSIVE THINGS IN ORDER FOR THEM TO REACH THEIR FULL POTENTIAL!!"

First of all, it is *not* an increasingly competitive world out there. It's an increasingly complicated and more rapidly changing one, but when it boils down to it we are still a friendly species who likes to spend time and achieve things together, and we're more productive than ever. If you can raise your kid to enjoy hard work and value constant learning, and enjoy working with other people, he or she will KICK ASS IN THE WORLD, both economically, and more importantly, from a life satisfaction perspective.

So when people spend all night in line for the privilege of signing their kid up for a $30,000 per year preschool, so they will qualify to get into the right kindergarten, then elementary, middle, and preparatory high school, so they can get into a specific Ivy League University.. I think they are wasting their time and money.

If your child gets a top-flight education, he or she will indeed be challenged and surrounded by other mostly-rich and driven children. This will indeed lead to better lifetime networking opportunities and a greatly increased chance of earning $500,000 per year in his 20s, and several million per year at the peak of his career.

Meanwhile, if your kid goes to your local public school and the nearest state university, in a good field, he'll be more likely to start out with just a regular job, and on average make the equivalent of $40,000-$100,000 after graduation, rising steadily based mostly on accomplishment and ambition. Of course, many of the most successful entrepreneurs don't even graduate from college at all, but for the sake of argument, let's still give the massive earning advantage to the Ivy Leaguers.

Do you think the $500k earner will be happier, or have a better life? Most people would say "hell yeah", because they incorrectly equate income with happiness.

I would say "hell no", because I have seen the trials and hardships of both the Ivy Leaguers and Public Leaguers long after they graduate and become real adults. Once a person covers their basic needs of food and shelter, additional income just goes to the false idols of luxury purchasing. Which doesn't make you any happier. Folks in the privileged class just get to buy a lot more stuff earlier, and they are trained to work longer hours in their careers. In the end, they are just more effective consuming machines. Big deal!

Both people mentioned above have the opportunity to lead a happy and productive life, and even to attain early riches and retirement if they happen to discover The Way of the Money Mustache early on. The real opportunity to win in life is in having good relationships with other people, as well as getting started early on having an effective philosophy of life, and gaining more autonomy and the opportunity to create work that you are proud of.

If you use your mind when doing it, raising a kickass kid *Costs Next To Nothing* in the grand scheme of a rich-country person's expenses. By my own calculations, the cost already starts out low (food, education, health care), and then is vastly subsidized by the fact that raising my child takes so much time that it *keeps me from having time to spend money on myself*.

Before parenthood, my wife and I used to go out to restaurants about once a week, take expensive snowboarding trips and jet around to places like Australia and Italy and Mexico. We bought ourselves cars, computers, stereo equipment, motorcycles, as well as filling our first house with furniture and appliances.

But now as parents, we realize that our kid doesn't give a shit about any of that stuff. So we've stopped being as interested in it as well. Now we check out books from the library (about 25 per week on average), watch science documentaries on Netflix, bike down to the creek to make ever-more ambitious dams from the round river rocks and sand, and we sit in a sunny patch on the garage floor with the hot glue gun, and make robots out of scrap metal parts that we find sitting around in my tool boxes (see headline picture for this article).

Our son goes to the public school that is a 5 minute bike ride away from our house, a school that is often passed over by the Ivy-League-Preschool set that occupies the other high-priced homes of our neighborhood. Ours is a school where about 40% of the kids come in with English as their second language, which seemed very exciting to all three of us in the MMM family. I only learned later that this statistic is considered undesirable to most high-income parents, because somehow they have caught the Disease that tricks people into thinking that the expensive and exclusive options are better than free or cheap ones.

The kid is off to a great start in his school life, turning out to have unusual abilities in many academic areas, and I believe a big factor in this is the fact that we have *not* given him the traditional rich-kid upbringing. We hang around mostly in a 2-mile area surrounding our home and play with kids that happen to live nearby. We don't have TV, and somehow the boy has no desire for products and toys that he doesn't already have.

If he's interested in lessons of any sort, we prioritize the ones that are within biking distance, and as a group we would probably hesitate to sign up for something in a far-off town unless it was to address a life-threatening disorder.

"But wait!", the rich might say, "You're denying your kid the violin and horseback lessons just because you're Cheap!"

Wrong again, fellow rich people. For a child in our country, Educational activities are in absolute abundance. Everywhere you look, there is *too much exciting stuff to learn!* It's just like adult leisure: there are far too many options, so you might as well pick the ones that are free, and offer the most benefit.

A key part of this whole Excellent Childhood deal is YOU. I usually spend about 6 hours a day just playing and learning with my son. I view myself as one of those automated tour guide devices that you can walk around with in a museum – except I'm available to him wherever we are in life.

"Why did the water in the creek flood this dam we made yesterday, Dada?"

"Well, did you notice how it's hot outside today? Look at the thermometer on my watch – 86 degrees Fahrenheit, or 30 Celsius. Now look up into the mountains where this creek is coming from? What do you think is happening to the snow on a hot day like today?".

Isn't that FUN? .. Just from random hanging out and playing, we have had opportunities to discuss the water cycle, the workings of every major part of a house and car, the biology of plants, animals, and insects, the entire solar system including each planet and its moons, the earth's ecosystem, oceans, weather, feelings and psychology, culture and alternatives to violence, reading, math.. and I have no idea of the whole list, I just find that these things tend to come up, even if you're just playing with Lego or making wooden ships together in the garage. Kids want to learn, and they'll gladly suck far more information out of you as a loving and dedicated parent, than they can from a classroom setting alone – even in the best school.

Although Mrs. M. and I have only been part of the school for two months at this point, we have also signed up for a reasonable amount of in-school volunteer work. We get the chance to spend about 4 hours per week each there, and it feels great to do unpaid work to help the staff and have one-on-one time with dozens of little kids, many of them excited to see parents contributing in their classrooms. This is apparently a record year for parent volunteering at our school, possibly because the attitude of becoming more involved with school is growing in my own particular area.

Some go even further and take up homeschooling with their kids. I admire these people and I believe it can be a great choice for those with the inclination to do it. Personally, I am very happy with added random socialization added by the public school, and the added free time it provides us parents to balance our own lives back out during the school hours. (And thanks to magic of public education, there is no tuition bill!)

Just like most of the other areas of modern life, child-raising is one where the cost and the benefit are actually two unrelated things. You can spend a lot, and get no benefit at all. Or you can spend very little, and get the greatest results. The Early Retirement Extreme guy would say that these variables are described on two entirely separate axes.

For some of us, this means we can spend less on our parenting habit, and still become better parents at the same time. For others with a surplus of money, more expensive options certainly open up – but don't feel they are better just because they cost more – and remember the secret cost of every decision to spend more if you are not yet retired – it takes you away from your own kids.

Eliminate your dependence on foreign (and domestic) clothing

By Mr. Money Mustache

Eliminating Lady Temptations: Step 4 (see other steps)
by Mrs. Money Mustache

we rented our house this past summer and wanted to clear out some of the clutter for our incoming tenants. As I started sorting through this box to put things away, I suddenly felt defeated. With clothing piled high all around me, clothing I hadn't even looked at in months, I felt the excess of my younger years coming back to haunt me.

I don't want all this stuff! It's too much. A normal person does not need this much clothing! I looked around at all the shirts, yoga pants, and sports bras and remembered all the random purchases I had made back when I thought that moving to Boulder and having a new active lifestyle meant buying new stuff.

What struck me at that moment is just how much I have changed.

Between the ages of 25 and 29, I spent a LOT more money than I do now, even while I thought I was being frugal. We "only" went out to eat once a week, we biked to work 3 times per week (and carpooled the remaining 2 days), and we were saving quite a bit. But, after having "The Talk" with MMM (after minor arguments about some of my habits), I realized that my two big problem areas were books and clothing. The books part was easily resolved: I started using the library and in the process found a new love. The clothing part was a bit harder. I probably spent $50-100 per month, for several years, on this habit. When you add that up, it's several *thousand* dollars of clothes and shoes that marched themselves into my closet.

Now, you might be thinking "if you have enough money, why is that a problem area?" Well, it's because we had a Goal. We wanted to be financially secure before having a child, to the point of BOTH of us being able to stop working to raise our child. This goal was very important to us, and this obsession with buying clothing was getting in the way of it. And being with my future child was much more important than owning a bunch of activewear. Plus, I knew that my addiction to clothing was not making me happy in a lasting way, and was thus a self-defeating habit that I often regretted.

So, I stopped. I just stopped buying clothes. I had a lot to choose from, so I went through everything and created a wardrobe of things I liked. I didn't even give anything away yet – it was all still so new. But, I actually looked at all of it and realized just how much I really had. I pulled out everything that was hiding in drawers, stuff that I had put away in boxes, and I analyzed each item and decided whether it belonged in my closet and in my life. Interestingly, a lot of it failed this test – even things I had bought recently (often online) were not getting worn, as they didn't fit or were not practical. What a waste! Once I had it all in front of me, I realized I had Enough. I could live the rest of my life with this wardrobe.

That doesn't mean that temptation didn't strike every once in a while. If I went to work and saw a friend with cute shoes, I'd start thinking that maybe I deserved some cute shoes too. But, instead of just going online to find a deal on cute shoes and clicking "buy", I would wait. I would say: "If I still want this in two weeks, I will get it." Sometimes I'd even go online and add it to my shopping cart (sometimes just that simple act was enough to make me get over it, although I wouldn't recommend it as it can lead to disaster). But sure enough, I found that the two weeks would pass without me even thinking about the shoes. I simply forgot and was on to something else, which I then forgot about in two more weeks. My two week policy matured to became one month and more, and recently I waited 6 months before buying a new pair of pants.

But back to Olden Days Me: Eventually, I quit my job in Boulder and started working from home. At that point, my urge to buy clothing completely went away. I now had too much clothing and never had the opportunity to wear any of it. I was finally brave enough to give a lot of it away and felt really good about the fact that people who really needed it would be using it.

For MMM, it's easy to avoid buying clothing or pretty much anything else. He literally feels mental pain when purchasing something and considers it for a very long time (often after writing out a sheet of equations). For me, it was a lot harder and I had to slowly change my perspective on things. The longer I do it, the easier it becomes and it is absolutely a life changing experience.

I have a long way to go. I still make excuses to drive occasionally, even though I know I am perfectly capable of biking (and strangely, every time I bike I feel fantastic, so why do I even make excuses?). I still live an incredibly lavish life and feel like I should be doing more to reduce my environmental footprint and correspondingly increase my happiness. But, I've got it pretty good. I am happier than I have ever been in my life and it all started that day when I decided to stop buying and start living.

So, as I sat there with all that clothing around me, the internal weeping turned to laughter. My son came running into the room to see what was going on and we piled the clothes up high and started throwing them around and jumping into the pile. Ultimately, by eliminating my clothing habit, I gained time with my child. And, the value of that time is priceless.

It’s All About the Safety Margin

By Mr. Money Mustache

Mon, 17 Oct 2011 12:00:20 +0000

Being the bossiest personal finance role model on the Internet, Mr. Money Mustache naturally receives quite a few challenges on the accuracy of his math and assumptions.

It is with a palpable sense of glee that some people dig into my calculations, find something they disagree with, and then **jump up and down and throw it in my face like a monkey flinging its feces at an opponent.**

“GOTCHA MMM!

You just told me that your property taxes are only $2400 but mine are twelve grand! And, your assumptions about future stock market returns are different than what I just saw in this random article on Buzzfeed.

So therefore, everything you write about is bullshit and all the principles of Mustachianism are therefore invalid!”

And I will admit that I do make mistakes sometimes, both plain old typos, and even overly simplified assumptions. This is because it is not easy to model something as complicated as a Human Life into a series of income and spending equations – especially when the income portion is derived from investments, which in turn further depend on the activities of other unpredictable humans.

But yet I am incredibly confident in the future – my family and I will lead a happy life, and we will almost certainly have a growing surplus of money for the rest of our lives. We started the clock on retirement about six years ago, and despite a negative stock market performance, and even some expensive business and legal problems a few years ago, we have still done just fine and are ending up further ahead each year.

What is causing all of this good fortune? Baby Angels? Envy-inspiring Luck? Smugness?

Nope, it's actually just another example of math and statistics playing out behind the scenes, in the form of something I would like to re-introduce to you as **the Safety Margin**.

Back in Engineering school, they used to teach us that every piece of real-world information comes along with an unspoken "Error Range". By testing a sample of soil upon which you want to build a bridge, you might find that the soil can support a load of about 2000 pounds per square foot. But because you don't know what is hiding deeper inside the Earth, the real value could range between 1000 and 3000 PSF (based on what the other bridge builders before you have measured and recorded around the world). So you design your bridge strong enough to survive even on 1000 PSF soil.

You will be using concrete that can withstand 5000 pounds of pressure per square inch. But because there could be an error at the cement factory, the real range is between 4000 and 6000 PSI. So you design the bridge even stronger, to survive even if it was made of 4000PSI concrete on 1000PSF soil.

If you continue the chain of calculations, you end up with a longer and longer list of error ranges, and you can adjust your design to accommodate all of them. If you use the most pessimistic number for all possible decisions, you'll end up with a bridge that is incredibly strong. But it will also be **incredibly expensive**, because you've over-engineered it. As a house builder, I would often joke about the over-cautious nature of structural engineers for my houses – they would design everything ten times stronger than any house I had ever seen, and then just for extra insurance, add a footnote at the bottom specifying

**the structure shall also be built upon a titanium column that extend to the center of the Earth*

So yeah, that is *over-engineering,* and I hope we can all agree that at a certain point, there is such a thing as being *too careful*, because caution is expensive.

On the other hand, if you design the bridge to withstand exactly the expected amount of stress and not an ounce more, it will collapse as soon as something unexpected happens to it. This is *under-engineering*, and it is easy to see why it is dangerous.

Somewhere in between is a happy medium where your bridge is statistically very safe, yet not nearly as expensive as a worst-of-all-cases design.

In my old field of Software Engineering, the same principles applied when estimating how long it would take to develop a big product which took the cooperation of many people to build. Each stage of the project might be estimated to take five days, but in reality it could take between 2-10 days depending on unforeseen hardships in working with the new technology.

The most pointy-haired managers would create what they liked to call "aggressive" schedules that would assume each stage would get done in 3 days (a brilliant idea often accompanied by the suggestion that we all put in some nice unpaid overtime to accomplish this). Sometimes work would fly along without any problems even on the shortened schedule. But then the inevitable unforeseen hardships would occur, and there would be no slack in the schedule to allow the designers to catch up. This would in turn cause delays and stress, which in turn would compound, causing people to get flustered and create low-quality work that took months to clean up… (or sometimes which never got cleaned up and would eventually destroy the company in the form of buggy products.).

Wiser managers with knowledge of the Safety Margin principle would schedule 5-8 days for each component. On average, some would go more quickly. But then the engineers would also have time to solve the problems in the more difficult parts. In the end, everything would be completed just a little bit ahead of schedule, most of the time, leaving everyone feeling good about their jobs and creating a higher quality product as well. Once I learned this trick, I started running my own group's projects this way, much to the amazement and scorn of the pointyhairs.

But the safety margin isn't just for engineers. I had a friend once who was late for almost 100% of his appointments. It was because he planned them like this:

"OK.. I need to meet with MMM at noon. But I also want to meet my friend in Boulder for coffee that morning. So, a 15 minute drive, an hour for my coffee date, plus 15 minutes to drive back home for our second meeting. So I'll leave my house at 10:30am".

All of these times might be accurate in ideal conditions. But with no safety margin, they don't leave time for a traffic jam, or a conversation running longer than expected, or a freight train crossing the road, or getting an emergency phone call from your Mom just after your coffee date.

On the opposite end of the spectrum, I'm a compulsively cautious planner, because it is *never* okay for me to be even one minute late when another person is waiting for me.

So I might allow 20 minutes to get to the coffee shop, 90 minutes for the meeting, 20 minutes to get back, and then a further 15 minute safety margin just in case anything else goes wrong and also in case the other person shows up early for the appointment. Thus I'd be out the door by about 9:30. My own slogan for timeliness is "If I'm not at least 5 minutes early, I'm late". By never packing too much into my day, I was always able to commit full effort to the things I did schedule.

Now we can finally bring it all back to financial planning. When a young lad graduates from college and gets a new job and an apartment or house-with-roommates, he is implicitly choosing a safety margin. If his job pays

$2000 per month, and his food and rent is $800 per month, the margin is fairly reasonable.

If he signs up for a car loan at $300/month, the margin shrinks considerably. As more services and especially loans are added, the margin can approach zero or even become negative. And even with a small positive margin, the slightest change in life situation – like a medical bill, a job loss, or a partner or spouse losing their job, can tip the whole balancing act quickly into the shitter.

Modern life also creates the the issue of a *time* safety margin. When people design a long double-income commute into their lives, add kids, and schedule an Olympic Roster of events for everyone involved, they have **eliminated their time safety margin**.

With no slack in their schedule, they feel overwhelmed when the prospect of change is suggested to them, and many of them complained violently on Hacker News and Metafilter when an MMM article pointing out the fact that most long car commutes are in fact self-imposed and ridiculous went somewhat viral on the Internet last week.

Because of all this, I would suggest that modern life works best if you design in at least a 50% safety margin. In other words, find a way to live on no more than 50% of your take-home pay, and keep plenty of your non-work time open for freestyle learning and new experiences.

If this means living with parents, family, or in a nice house with roommates initially, so be it. On average, the 50% that you save will build up rapidly and start providing an income stream of its own, and also on average, the take-home pay of many recent graduates will tend to rise over time. So a lifestyle of increasing luxury is still available as time goes on. But the safety margin will always be there for you, preventing financial disasters as well as giving you a vastly wider range of choices in your life.

I think I may have been born with *too* much of a love of the safety margin. As a kid, I was afraid to try new things until I was sure I could master them on the first day of trying. As a teenager, when I played real-time strategy video games I would always amass a ridiculously overpowering army before swooping in to destroy the opponent – I was too cautious to risk an earlier attack. And as a planner for early retirement, I built up a 'Stash of savings that was big enough to live on, as well as several backup systems that could also provide a living if anything went wrong with the primary system.

So let's review what I view as my own financial safety margin. Doubters and Anti-Mustachian complainypantses should pay close attention, because it is this network of flexible parts that allows me to safely brush off minor details like "what if your health insurance premiums rise?", or "how will you pay for your kid's university education?"

All told, the safety margin represents a 500-1000% flexibility in the income to expenses ratio that can be adjusted to meet any situation. And in all reasonably probable cases, Mr. Money Mustache will both retain and further entrench the status his doubters on the other discussion boards so happily like to question.

First level of safety: a primary income. Right now, this is a rental house that provides an income of $24,000 after expenses – just a bit more than our family's spending last year. If the rental house happens to go up in value faster than general inflation by the time we sell it (aka, a housing market recovery), this would be an unbudgeted additional safety margin.

Second level of safety: a backup income. We also have some index funds in taxable accounts that provide capital appreciation (admittedly negligible in recent years), and a strong level of dividends that are just building up for eventual future use.

Third level of safety: optional part-time work. Levels #1 and #2 are paying the bills and continuing to build a larger safety margin, but Mr. and Mrs. Money Mustache also have some free time during school days, and we love to accomplish things during that time. We happen to get paid for some of these things – financial and real estate work on her side, construction and internet-related things on my side. This income gets saved as well.

Fourth level of safety: 401(k) plans. We stashed away quite a few years worth of maximum-level 401k savings back in our working days, and they will collect dividends and appreciate until we can crack into them at age 59.5. Assuming a reasonable level of stock appreciation over the coming decades, these funds alone will be enough to live off from that age forwards – **despite the fact that we aren't even planning to spend the Level 1, 2, or 3 money before then!**

Fifth level of safety: Social Security! This is an unpredictable benefit due to the political questions surrounding the program, but it will very likely still provide a substantial portion of our living expenses, since even $600 per month in today's dollars is a substantial portion. All of the first four levels of safety don't even assume *any* support from Social Security.

Sixth level of safety: lifestyle flexibility. The MMM family currently spends about $24,000 per year, but there is plenty of room for improvement if money ever became tight. All of the safety systems above have been built assuming a level of spending even higher than our current $24,000 rate. We could easily move to a much smaller house, take fewer month-long trips, go car-free, stop buying organic food, and more. And, I also assumed that our child-related expenses will never go away, which in fact they probably will in less than 20 years as Junior 'Stash grows up to forge his own way in the world.

Seventh level of safety: Work Flexibility. I could start building more stuff for people, and earn three times our living expenses from that alone. Or I could go back into software and earn even easier money. Mrs. M. could probably out-earn me by using her golden reputation among the people she used to work with to get a new job. Or she could just start rustling up real estate work. I have a huge fancy finished basement suite in my house that we could rent out for about $8000 per year with only minor modifications. I could buy a multi-unit apartment building for thousands per month in cashflow. I could start peddling "Mustachian Wear" clothing and e-books on this website. Or we could start some sort of entirely new business!

It all seems a bit excessive when you type it out in a big list like that. And indeed, it could be said that Mr. Money Mustache is actually a bit of an overcautious wimp when it comes to financial planning, not the reckless chronic optimist that many people accuse me of being.

But I just wanted to share the thinking process that goes into retiring confidently. By building a large safety margin into everything you do, you open up a whole new world of options for yourself, and the resulting reduction in stress and increase in happiness tends to feed back into more energy, trying more new things, and opening up even more options.

And since in real life, it is very unlikely for every single thing to go wrong in a well-protected system, you will tend to have ever-increasing safety margins throughout your life. Six years into retirement, I already see this happening at an increasing rate.

So what is the lesson? Save your current income, even as you build complementary skills like frugality, adaptability, and the ability to earn money in more than one way. Then you'll be ready to retire much earlier, because the sum of your safety margins will be enough to make you feel comfortable taking the leap. And most importantly, stop worrying!

MMM Challenge: Try Getting Your Groceries with a Bike Trailer

By Mr. Money Mustache

Thu, 20 Oct 2011 12:31:15 +0000

Bicycle post.. and looking around on the city streets, I can see that the message obviously hasn't caught on yet. As usual, it is best illustrated with a story:

The Mrs. and I had a craving for a fancy salad during a recent lunch time, and we were fresh out of fresh choppable items to throw into it. In fact the grocery list was getting pretty long overall (except for core staple items – we're set for months on those thanks to my recent Costco run). So I hooked up my bike trailer and started coasting through the city streets – 2.4 miles of them to be exact – to visit the King Sooper's grocery store.

This particular store is on a stretch of Stripmall Hell called Hover Road. I'm sure it is the very Aorta of Longmont's city budget because of the sales tax it generates, so we can't do away with it, but man, is that ever an unfortunate street. 2-3 lanes in each direction plus a jumble of turning lanes and medians in the center. A grueling thousand-lane intersection every few hundred yards. And an absolute cacophony of stupid SUVs, delivery trucks, illegal-muffler Harleys, and regular cars roaring, rushing, idling, squealing, honking and crashing constantly. The street divides an oceanic stretch of parking lots on each side. There are thousands of parking spaces that are usually empty – probably built under a bizarre old city regulation that requires each business to pave enough space to accommodate the largest possible crowd – even though it is theoretically impossible for that to happen simultaneously for all businesses.

It’s very frustrating to drive to any of these stores, because you can see your final destination long before you reach it. “Oh! There’s the grocery store right there! Oh, shit, but here’s a long traffic light. Slow down. Stop. Idle. Wait for the crossing street’s left turners. Wait for the crossing street’s main traffic. Red light for everyone. Wait for the oncoming traffic’s left turners. OK, finally green for me. GO!!! Cut into a turning lane. Wait for more traffic. Enter parking lot. Wait for moms and kids pushing shopping carts. Wait for single lady to back out of parking space at 0.0007 MPH in the shiny black Escalade. Take spot far from store. Get out, lock car, start walking.

The reason all this sounds so stupid is because IT IS. Cars are EXCELLENT inventions for crossing remote mountain ranges and deserts and rolling country fields when travelling from one city or state to the next on a roadtrip with your family or friends. But they are STUPID for driving through your own town to get groceries – because everyone else is out there doing the thing, ruining the fun of the drive for you.

Compare this to the experience of riding your BIKE to the grocery store: Hook up the trailer. Hop on the bike. Get your legs and heart pumping as you ride the low-traffic route you proudly devised for yourself. When I approach Hover Road, I move onto the sidewalk, because I don’t want to mix it up with all those cars. I hit the pedestrian crossing button, and wait for a nice peaceful walk signal for myself. If it’s a long wait, I might even read an email or two on my phone. Green light. Pump the legs and accelerate smoothly through the intersection, right across the grassy median and into the grocery store parking lot instead of doing the 75-mile detour that cars have to do to access the busy main entrance to the parking lot. Cut directly across the entire parking lot at 20MPH and screech to a halt at the bike rack (or lamp post or tree) closest to the store entrance. Lock bike and head directly into the store.

In the olden days, I still bought groceries by bike occasionally, but I was forced to use the car for the giant weekend runs, because you can only fit a few things in a backpack. Two jugs of milk and you're already almost out of space. But with the bike trailer, as it turns out, you *easily* can fit a week's worth of groceries for a family of four. I have packed spectacular quantities into even my small Nashbar trailer – one time I hauled $150 worth of items which I later weighed at 94 pounds – with very little effort.

So we've established that it is fun, and that Mr. Money Mustache likes to do it. But MMM can be intimidating at times, because he likes doing *everything*, right?. Once in a comment on this blog, he was even accused of being likely to remove his own appendix if it ever started acting up.

To bridge the gap between myself and the Still Aspiring Mustachians, I decided to conduct an experiment last week. I decided to see if I could get my wife Mrs. Money Mustache to try using the bike trailer to get the groceries, for the first time in her life, and report back to me on how it went.

Now, despite her relative badassity, Mrs. M. is actually a bit cautious when it comes to biking. It always takes a bit of nudging to get her to step up to the next level – from a bike ride in the park way back in the 1990s, to biking the 8 miles to our high-tech jobs in the 2000s, to pulling our son around in the trailer in the 2010s, and now to this final frontier – foregoing the car in order to join me in my established habit of bike-trailering the groceries. I knew it would be tricky, but I was able use my newfound status as Mr. Money Mustache to issue her an **MMM CHALLENGE!!. "Are you badass enough to ride to the grocery store, then have the results reported to our Valued Money Mustache Readers!?!?!"**

With the public pressure of thousands of people watching her, Mrs. M. proudly rose to the challenge, hooked up the trailer to her own bike, and pedaled off down the street. When she got back, she offered this report:

> I admit that I am a fair-weather, convenience biker. If I decide it's too cold or too far, I wimp out pretty quickly. For me, biking requires the right frame of mind and in my mind, biking to the grocery store seemed like a monumental task. After all, that's a lot of weight to lug around town, right?

> So, when MMM casually challenged me to bike to the grocery store, I was hesitant. But, then I thought of you fellow readers and decided to finally take the plunge and give it a go.
>
> I must admit I expected it to suck, but it didn't.
>
> The bike ride was extremely pleasant, even though it was all by road. MMM outlined a special way to get to the store where I cut through a park and took the small back roads to end up behind the grocery store (I'm sure you can find a special route as well). I got there quickly and was amazed at how easy and relaxing the bike ride was – it was quiet and I hardly saw a car. I locked the bike right next to the front door (how convenient is that!?) and walked in with my KeepCool bag and a variety of other beautiful cloth bags made by a friend of mine.
>
> When I came out with my big load (which I later learned weighed 52.5 lbs — only about 10 lbs heavier than my 5-year old), I parked the shopping cart right next to the bike trailer and loaded it up. This is the part I had been worried about: biking home. But, again, it was a breeze! I even stopped at the park to watch the geese on the lake. In fact, that bike ride to the grocery store brightened up my whole day. So, MMM, I can now publicly admit that I was wrong. Biking to the grocery store is easy, fun, and awesome!

So where's the money saving aspect in all of this? It's in the surprising amount of driving that most people do to get their groceries. I find that I need to visit the store about twice a week. That's 104 grocery trips per year. Each one would be a 5-mile roundtrip for me, meaning 520 miles of driving. Now, there are a variety of ways to calculate the cost of driving a car, but short trips are the most expensive since they involve more engine wear and lower fuel economy. We'll use the IRS rate of 51 cents per mile, meaning $265 of driving expenses that I avoid *every year* by biking to the grocery store. The real savings are of course much higher, because I get enormous health and stress reduction benefits by riding instead of driving too.

So with that 1500-word justification, I now **pass on the MMM challenge to you: If you've never done it before, try getting your next grocery**

load by bike. If you don't yet have a trailer, you can start with a small trip using a backpack. Get into the swing of things. Remember to bring your bike lock and your cloth grocery bags. I picked up a gigantic insulated bag with thick handles and a sturdy zippered top for about $7 at Costco that says "KeepCool" on the front. It keeps the frozen stuff cold while biking in the sun. I throw that into the bike trailer before heading out each time.

Once you realize how fun it is, you'll want to upgrade to a trailer (search for "trailer" on Craigslist under baby/kid stuff), or if you want a more Hipster-style trailer and don't mind paying a bit more for it, get one like this: Croozer Cargo Trailer

Existing Bikers: tell us how much you like riding to the store. **Soon-to-be-bikers**: tell us how you tried it for the first time and loved it. And ask if you need any more advice on how to make it work. Then spread your new skills to your other still-driving sucker friends.

Because of YOU, worldwide grocery store parking lots will soon be abandoned, and we can replace them with gardens and solar farms to power the grocery store itself. All from one MMM challenge. Yeah!!!

*** Footnote – I noticed that an ad for some neat-looking "Zigo" cargo carrying bike appeared magically at the bottom of this page when I previewed the finished post. I had never heard of this thing, but it looks neat. Hmm, I wonder if they need any bloggers to do reviews of such a cool product in exchange for a nice long loan to allow thorough testing ;-)*

What is Hedonic Adaptation and How Can it Turn You Into a Sucka?

By Mr. Money Mustache

Sat, 22 Oct 2011 12:36:47 +0000

Compact Cruise Ship Parking Only

In writing this blog for you, Mr. Money Mustache actually has three major goals:

1. **To make you rich so you can retire early.**
2. **To make you *happy* so you can properly enjoy your early retirement.**
3. **To save the whole Human Race from destroying itself through overconsumption of its own habitat.**

All three of these goals are in perfect alignment, and they mix and mingle in different ways depending on which aspect of Mustachanism we are discussing at any given time. Today we'll be focusing in on #2: What actually makes us happy.

Now, everybody knows that I like to promote a relatively frugal lifestyle. Critics of my approach have said things like this,

> **"You can't take your money with you when you die, buddy. How'd you like to die tomorrow after scrimping and saving for your whole life, never having spent your money?"**

> **“I happen to like driving around in a nice car. There’s no way I’m going to bike to work all week and work hard every day just so I can drive around in a $5,000 shitbox on the weekends” ***
>
> **“I like to buy myself something nice a few times a year. What’s the harm as long as I’m staying within my budget?”**

In fact, even the relatively frugal financial blogger I call Mortgage Free Mike once wrote this comment on an earlier MMM article:

> **“You have a really great.. and unique… attitude about money. I’m not sure if I can regularly deny myself purchases, but at the same time tell myself that it’s a win, but it’s worth a shot!”**

All of these statements would have sounded perfectly rational to me when I was just a little younger. In fact, the one breakthrough that flipped my thinking on the matter was learning about the scientific studies that have been done on *hedonic adaptation*.

In less fancy terms, what this term means is that “no matter what happens to you in your life, you’ll very quickly get used to it”. Hedonic Adaptation is a feature built right into your Human DNA that allows you to function efficiently in a wide variety of environments, even very harsh ones.

A most striking example of this was a 1978 psychological study that evaluated the happiness levels of recent lottery winners, and recently injured paraplegics relative to the general population. As you’d expect, the lottery winners were pretty upbeat immediately after their win, and the paraplegics were pretty pissed off. But within just *two months*, both groups had returned back to the average level of happiness.

“That’s Impossible!” , I thought. “How could this be!?”

Well, it turns out that when a person jumps to a new level of material convenience, he loses the ability to enjoy the things he previously thought were pretty neat. A cold Bud Light was once a true delight after a work day for the lottery winner, but after the win he quits the job and takes up high-end scotch, poured by a personal butler. Both serve the same purpose, and the pleasure is about the same. Similarly, when moving down the hedonic scale, either voluntarily or involuntarily, we can learn to appreciate simpler things with just as much gusto as we would have appreciated more expensive things. I truly love the sound of the wheels of my bike slicing through the quiet wind on an open road, just as much as I enjoyed the whirring sound of the gear-driven camshafts and the rich tuned exhaust note of my old VFR800 motorcycle.

This happiness averaging also explains why we the people of the most materially abundant country in the world, the United States, where the gas is the cheapest and the cars are the fanciest and the houses are the biggest, are actually quite far below other less wealthy countries in the world when we evaluate our own happiness. Depending on the survey, you'll see countries like Denmark, Switzerland, Austria, Canada, Bhutan, Mexico, Cuba, and others kicking our ass, and the US rarely ranks above #17 on the list.

It is intuitively hard to believe these things at first, when you have been raised as a consumer. My cravings for the crisply carved seats and slickety smooth gearshift of a Mini Cooper S felt very real. Just as Mrs. Money Mustache's cravings for the artistic perfection and self confidence boost offered by the latest names in athletic fashion felt real. In fact, the cravings ARE real, and the adrenaline rush of buying these new things is real as well. They really do make you feel happy – for a very short time.

The key for me is not denying the existence of the craving or the short term rush. It's zooming out and reminding myself, "Dude, the scientists have already figured this out for you. You can buy the Cooper, and get a short term rush, or you can put that same energy and money into doing something that creates far more lasting happiness."

And that's the golden nugget for you. You only have a limited lifespan, and you've got a real chance to go get yourself some lasting happiness. Are you going to spend that time chasing the scientifically-proven-to-be-ineffective short adrenaline rushes that you get from buying yourself some more shit? Or would you prefer to actually experience Several Golden Decades of Deluxe Life that are so good you look back and laugh at them even when you are a Skeleton?

Luckily, the wise scientists and psychologists who came before us have already done the work, and we know, in a general sense, what is most likely to make a person happy. And when it comes down to a battle between my own emotion-biased intuition, and real scientific research, I'm going to side with the scientists every time, because I always bet on the side where the odds are in my favor.

In no particular order, the biggest factors influencing human happiness include meaningful work (with lots of autonomy, low stress, and low fear of losing your job), private life, community, health, freedom, and a philosophy of life.

Pretty simple isn't it? And you will note that the Way of the Money Mustache addresses *all* of these areas.

Because work is such an important part of human happiness, as a Mustachian you will work as quickly as possible to take the money component out of it, so that you can have the option of deciding like a real Adult what kind of work you want to do each day. To achieve this, you will lower your expenses and put the incredibly high level of savings that result, directly to work for you. And in the process, you won't suffer at all, because all you're giving up is a little bit of the Hedonic Adaptation Crack Cocaine.

By gaining financial independence, you will naturally turn more to helping others, bonding with your own family and friends and community, and you'll have the extra time and the reduced stress levels allowing you to take better care of your health. Freedom goes without saying – here in the rich world, the only widespread form of slavery is the economic type**. Debt and an addiction to high consumption are a very real form of slavery, and gaining freedom from it is a genuine contributor to Real Happiness.

People who are already financially independent might now step in and say "Aha, but if I've already got the freedom and the health, *then* am I allowed to go out and buy myself a whole bunch of fancy shit?".

This question becomes more complicated. I've pretty much been cured from the desire for a lifestyle any more luxurious than the one I already live. And I'm actually hoping to step it down gradually over time. The obvious reason to reject things like a fancier car or house is that they use up more of the planet's natural resources that could be used to help someone else instead. On the other hand, buying more services and experiences in your own community might end up supporting younger and less wealthy people (students, actors, musicians, artists) which might do a bit of good to society and share your wealth. I like the idea of starting businesses that employ a wide variety of people and treat them unusually well. Or creating funding incentives for schools and students in such a way that they up their game significantly. It's a tricky problem, deciding what is the most efficient use for extra money, but I'll leave it to you to think it over when you get there.

So when you hear people who are still in the Sukka Consumer mindset, telling you that they don't want to *deprive* themselves of the happiness afforded by buying things for themselves, even while they struggle with debt or unpleasant work, tell them to look into the science behind what they are saying. They're actually like a dangerously unfit person saying they don't want to *deprive* themselves of the pleasure of sitting on the couch all day and go out for a walk instead.

Science has proven they are both wrong. The sooner you can accept this convenient fact, the sooner you can become rich. And happy!

** Actual closely paraphrased quote made somewhere online about an MMM article.*

*** Correction: years later, a reader pointed out to me that literal slavery still exists and it's still a big problem due to Human Trafficking – even in the US. More information at the [Polaris Project]() and there's also a [Wikipedia entry]() on it. (Thanks Seth!)*

The Joy of Part-Time Work

By Mr. Money Mustache

Tue, 25 Oct 2011 12:00:48 +0000

 I've got a little secret for you.

Between the frosty North Pole of Unemployment, where your bank account dwindles and your debts multiply while you sit at home and fidget nervously, and the Sweltering Jungle of Full Time Employment, where you wield a Firehose of cash but have absolutely no free time to do anything besides work and eat, there exists a temperate la-la land where the climate of life is balanced and happy. It's called Working Part Time!

"Meh", you might say, "I already know about part-time work. That's what burger flippers and Wal-Mart greeters do. But I'm a professional – my choices are only 50 hour workweeks plus commuting, or a slow death of whining at home on my couch while bankruptcy swallows me".

But it may not be true! The world of Professional Employment is actually much more open and flexible than we've all been trained to assume. And the reason is that behind the granite-carved corporate logos and expensive office furniture and the uncomfortable formal clothing, companies are secretly run by *other humans, just like you and me*. On the lower rungs of the corporate ladder, these humans tend to cling to the rules and policies and try to limit your individual choice. But you don't have listen to them. With some gentle pressure and plenty of underlying job competence, most of us have more negotiating power than we realize.

When Mrs. Money Mustache first came to the United States in 2000, and got her first job offer for $40,000, she was pretty excited. But when I suggested she enthusiastically thank the company for the offer and accept it – while requesting that the pay rate start at $44,000 – she was quite nervous and skeptical. But with the confidence of knowing she was valuable, and the backing of a low-cost lifestyle that would allow her to continue searching for a job if this one didn't work out, she made her counter offer.

A week later, she walked into her new office and started raking in the shiny new $44,000 salary, which became the basis for future raises for the rest of her corporate life.

When Mr. Money Mustache was ready to tip work-life balance a bit more to the Life side in 2004, he suggested the benefits of the arrangement to his manager at the big high-tech company. The manager happened to be a career corporatist who didn't see the point of anyone ever working LESS. But after a few conversations and a shared meeting with a very high level director, a deal was made and MMM started taking every Friday off, in an exchange for a 20% pay cut.

You, the MMM readers, are some of the world's most innovative and competent professionals. Your company needs the skills you provide, and they don't want to lose you. And you have an electric personality and are quite good looking as well. Because of this, it is quite possible that you too can write your own ticket and start working less whenever you feel ready.

The benefits are mutual. Your company will see an increase in productivity from you on a per-hour basis, because you will be operating in a more efficient creative range, much further from burnout. You might even get MORE done in three or four great days of work, than in five ho-hum days. You will gain the mental space to innovate.

But your personal life will take an even bigger leap upwards. Imagine: EVERY weekend is a long weekend. An extra fifty-two days, or Ten Weeks, of vacation per year. Your free time jumps by 50%. You can use the extra day for self-development: sleep in a bit, do a huge workout and/or bike ride, get the groceries, read a book, practice a new skill, then cook a fancy dinner for yourself or your family. Isn't that better than the fifth day of work?

The ideas above are written from the perspective of a person who already holds a corporate job. And not all corporate jobs have that flexibility: a high school teacher or a police officer may not have the option to redefine their job, no matter how good they are. Then again, I do happen to know both a teacher and a police officer who did just that. There are always surprises waiting for people with the *cojones* to actually ask for something.

And luckily, there is still hope for everyone in the long run: Self-Employment. Whether you ease into retirement by slowly scaling back your corporate job, or jump into retirement by ending a less flexible job completely, the idea of doing something productive in retirement that may eventually earn you some cash is a great idea.

When you've led a life of single-payer employment, the idea of earning money for random things seems quite strange. "I don't have any skills, other than middle manager at Megacorp! Who would pay *me* to do anything?".

But the real world is simply more fun than that. As long as you remain curious and energetic, and don't work in a monotonous job so long that it crushes your spirit completely, you will find that things just magically start to happen once you have time to actually think instead of just working. This is why I feel that the earlier a person can retire from a less-than-fulfilling career, the better.

One early retiree I know found herself writing articles and magazine stories occasionally after leaving her full-time job as a writer. Another fiddles around with academic research projects and gets paid to review papers before publication. My brother will always be a touring musician even when he is done with his job of being an elementary school teacher by day. Others might be interested in real estate, photography, starting a climbing or kayaking school, bed-and-breakfast hosting, Android or Iphone app development, running an online store, becoming a fitness instructor, or self-publishing a book. Even after finding my own retirement nirvana with carpentry projects, I now find that even writing the Mr. Money Mustache blog could become a paying job if I wanted to put effort into making it earn real money.

The joy of part-time work is that it tends to lead you into unexpected new directions. Another joy is that it makes your retirement planning much easier. With a part-time income doing something you really enjoy, you might already be fully qualified to retire from full-time work with the savings you already have. You can retire MUCH earlier if you have a little spigot of money that you can turn on and off whenever you like.

Imagine that you need $24,000 per year to live on comfortably. You've been saving for a while, so you have $300k in retirement assets 'stashed away. Using the conservative 4% "safe withdrawal rate", you might only feel you can draw $12,000 per year from this fund to pay for your retired lifestyle. But with part-time work, you might find it extremely easy to earn the extra $1,000 per month. If you're part of a couple, you only need to earn $500 each, or a little over a hundred bucks a week on average, to make up the difference. That is easy money to earn, in the United States anyway.

But the biggest reason for my love of the idea of part-time work, is that it is simply a more natural and human-oriented way of doing things. When we get up every day and travel to the same place to work for a pre-determined number of hours, we are making ourselves part of a giant machine. It can still be fun at times, depending on who the nearest cogs are that we get to grind against, but it is still a never-ending factory that tends to dull our creativity over the decades. And the Western tradition of 40 (or more) hour workweeks is ridiculous. Paid work becomes the dominating part of your life, which is very efficient for saving up a large sum of money, but very inefficient if you have any other plans like raising children or accomplishing things other than work.

When you work at your own pace, however, everything changes. You get to decide what your goals are each week, and balance your work production against other things that are important to you. Sometimes work may be completely shelved when you take a trip or make a vegetable garden or move across the country to care for an elderly family member. Other times you might laser yourself in and become a Master of Disaster and produce a whole year's worth of income in just a few weeks or months. It can be difficult, since it all depends on your own motivation. But I think that slowly mastering your own motivation and learning to run yourself as a fully independent person is one of the most worthwhile things you can do with your life.

I sure have plenty of learning in the Self Discipline department to do myself, but man is it ever a great feeling to get a little bit further along in the project each week or each year. So that’s why I feel the need to stand up for the often-disrespected concept of Part Time Work.

Mr. Money Mustache Receives the Gift of Hardship for his Birthday

By Mr. Money Mustache

Thu, 27 Oct 2011 16:10:03 +0000

 I just had one of my stranger birthday experiences when I turned 37 earlier this week.

Things got off to an early start, when the doorbell rang at 12:01 AM, just as I was considering putting down my book and going to sleep. When your doorbell rings at that time of night, you answer it right away because it's either someone with a serious problem that needs your help, or someone threatening your family that needs a quick beheading.

Fortunately I could see through the window that it was an old lady in a night gown standing outside, so I bypassed my samurai sword collection* and rushed directly to the door to answer. A blizzard of snow was falling and my neighbor was looking anxiously at the Maple tree in her front yard which had branches drooping almost all the way down to the ground. In fact, all the trees were sagging dangerously and great wooden cracks were ringing out through the night air as limbs dropped throughout the area.

You see, we've had a very warm fall here in Colorado this year, with beach-quality weather almost every day, meaning that the trees have not bothered to drop their leaves yet and many of them are still fully green. When you take a bunch of 80-foot-tall trees who think it's still summer, and dump a foot of wet snow on them, you get some pretty serious trouble.

Anyway, my neighbor was just asking for some help to shake some snow off of the branches and evaluate whether any of the bigger trees might drop a limb through the roof of her little house. I walked around and shook and poked at various branches until the little tree sprung back up. I told her I thought everything else looked safe in her yard. Then I went back to bed. And somewhere in the night, a gigantic branch in somebody else's yard ripped through a major power line and all systems in my house went offline along with the rest of the block.

The Mustache family woke up the next morning to a still-warm house, since the considerable thermal mass was still fully stocked with stored sunshine from the previous day's warmth. But it was a chilly 32F (0C) outside with continued snowfall that had now piled up to well over a foot on the grassy areas. We learned that the elementary school had lost power too, and was therefore closed for the day.

We were forced to spend the day together as a family, finding interesting ways to have fun without power. My son was amazed to learn how many things required electricity to function (the garage door and blower for the natural-gas-fired furnace, for example). The gas and water service were still working, so we were still able to cook on the gas range and even get warm water for washing dishes. I learned that smashing coffee beans with a hammer is not a workable substitute to using a coffee grinder, since the grind is too coarse to get a good brew. Mrs. M and I became much stingier with our phones, knowing we had no way to charge them if the battery ran out. I emptied the fridge and freezer and stored the contents in coolers set into the deep snow outside.

Little MM gave me the birthday artwork he had secretly made for me (pictured above), and we spent the day using a snow shovel to build a mountain in the back yard, which we hollowed out to create a snow fort. The sun went down, so we came inside for a candle-light pumpkin carving session and dinner. The temperature began to drop further and the other homeowners on my block started either abandoning their homes to go stay with friends in other towns, or firing up rented generators to restore normalcy to their lives.

This was my favorite part of my birthday. We turned down a generous accommodation offer from some friends, even as the house temperature reached 58F, and the weather forecast called for a drop to 14F (-10C), an all-time record low for this date. We piled all of our warmest blankets onto the king-sized bed and closed the doors and shutters to the master bedroom to lock in as much heat as possible. I filled the 6-gallon glass carboy from my beer-making system with extremely hot water and brought that into the room to slowly release heat through the night as well. The boy decided that we must each tell one Jack-o-lantern-related story by candlelight, then we blew out the candles and closed our eyes. For the first time in I-don't-even-know-how-many-years, I fell asleep at 8:00PM.

I woke up ten hours later as a distant light clicked on and the furnace started blowing. I could tell from my exposed nose and ear that the room was quite cold, but damn, was that ever a great night's sleep. I gleefully contemplated all the advantages of having the power back, and hell no, I'm not going to start living without electricity on a full-time basis. But looking back on it, that sure was a nice birthday present that Mother Nature gave to the Money Mustache family this year.

** No, of course I don't actually have a collection of samurai swords. Oddly enough, I do have one black sword that appears to be for Ninjas, along with an enormous hunting knife, both left behind by an (evicted) tenant at one of my rental houses a few years ago. I sharpened them both up very nicely and use them for hacking down weeds, although they would also be ideal for unwanted doorbell-ringers.*

Foreclosure Update: House Bought, Plans Made, Bathroom Destroyed

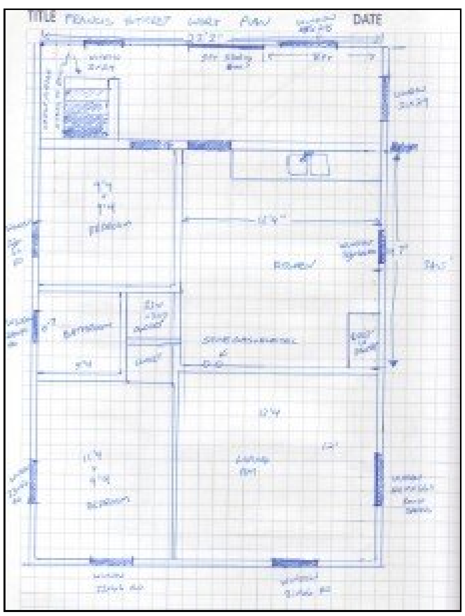
By Mr. Money Mustache

Sat, 29 Oct 2011 18:02:48 +0000

 this series, there has been a certain amount of drama on our latest road to Real Estate Riches. There's always drama when you buy a house, because relatively large sums of money are involved, and the sale involves a large number of people working together. A buyer and seller, real estate agents on both sides, a title company, and various inspectors, appraisers, contractors, lenders, insurance agents, and even lawyers depending on where you live. In the likely event that one or more of these people is incompetent, the whole production starts to take on a tragicomic quality, and you laugh even as you slap yourself in the forehead repeatedly and invent new swear words.

In our case, when inspecting the house, we discovered that both the roof and the plumbing system were inadequate to pass a standard lender's appraisal. In a normal sale, the buyer requests that the seller get these items fixed before the closing. But getting stuff fixed is beyond the technical competence of most big, slow banks, so at best you can negotiate additional dollars off of the purchase price. We scored an extra $1000 towards the roof and $500 towards the plumbing, even though fixing these things was already part of our original budget when first touring the house. So that goes straight to profit. But the fact that the house was un-appraisable meant that we had to pay cash for it instead of using bank financing. Paying cash came with the added advantages of avoiding appraisal and lending fees. Also, being an enthusiastic insourcer, I always do my own home inspections, saving a few hundred extra per house. All of this just further reinforces my belief that Cash is King when it comes to running a small business.

Other minor annoyances included the unplanned disappearance of several hundred dollars of landscaping materials that were originally in the garage, courtesy of the bank's unapologetic maintenance contractor who was "just following orders to remove construction debris", and missed deadlines and slow email responses galore on the part of the title company. Luckily Mrs. Money Mustache is a patient and meticulous real estate pro and she compensated for it all by watching the people and deadlines like a hawk. In the end, it all worked out as it usually does, and on October 25th, the MMM Foreclosure Investment Team closed on the house.



I had already gone through the house and done a rough scale diagram as I always do for renovation projects – this forces me to think through what needs to be done in more detail, and it also allows me to plan material purchases without having to frequently re-measure everything at the site. I keep a copy of this plan on my phone and can whip it out at any time during a trip to the building supply store.

If you're looking at the plan at left and are curious about the details: the only change we plan to make to the existing floorplan is to add a second door to the bathroom, making it a "jack and jill" arrangement that can be shared from both bedrooms, instead of only accessible from one as it currently is. This requires a full redesign of the bathroom, as it previously had a gigantic clawfoot tub jammed into the undersized room, a grotesquely squeezed-in toilet that was almost touching the side wall, and a miniature pedestal sink with nowhere to put personal belongings. All wrapped in a crooked, soggy, and mold-stained room.

And the kitchen will get some more countertop space, since it is just a big room with a single 8 foot countertop strip right now, and a lone fridge and range sitting off in the middle of nowhere across the room. One of my pet peeves in kitchen design is having fridges and stoves that look like a bulky afterthought instead of being integrated nicely to the kitchen.

Once I have a sketch, I like to walk through and make a list of what needs doing. Then I type the list into a spreadsheet, and make some conservatively high estimates on the labor and materials to figure out the total time and cost of the project. The simple spreadsheet linked above tells me that we're going to spend about $13,700 on the carpentry and materials portion of this remodel (including new kitchen appliances), which leaves about $12k for painting, landscaping, and other tasks if we want to stick to the original $25k budget. We did score an additional $1500 off of the purchase price from the bank, which adds to the safety margin of this project. Getting good estimates is pretty important, especially for renovations larger than this one. Since I've done all of these tasks many times over the years and always keep spreadsheet records of how long things take, I find that my time estimates are pretty good these days.

 Yesterday, with the appropriate building permits in hand, I began in earnest on the destruction of the old bathroom. It was a true pleasure, because it was such an incredibly ugly room. The first step was to strip it down to its original plaster walls and wood plank floor, then rebuild from there. This meant hauling out the clawfoot tub (which will be later restored and sold on Craigslist), the toilet, the sink, the weird vinyl wall material, and the stained vinyl floor over top of soggy particleboard. Above you can see a picture from yesterday in the thick of the action. The excellent mess and filth just makes the eventual finished product – a pristine and cozy tiled lair of comfort – all the more satisfying. The next step will be bonding a thick, level layer of structural plywood over the old plank floor, upon which we can build the new bathroom.

Part of the fun of rebuilding the bathroom is in fixing all of the haphazard plumbing in the basement. Like most old homes, this house has endured over seventy years of hacking and repairs on its plumbing system. Cast iron is smooshed together with sections of Pure Lead(!), rusty galvanized pipes join through heavily-corroded adapters to copper, rubber joints splice in various newer parts made from ABS (black plastic). All of it hung loosely from the ceiling and zigzagged at awkward angles. With great gusto, I took a sledgehammer in each hand and crashed them together from opposite directions onto the biggest piece of cast iron pipe*, and kept pounding until every bit was laying shattered on the concrete floor. I pulled out the remaining loose fittings from the ceiling, cleanly cut off all of the spaghetti of copper and galvanized supply pipe, gathered up the 320 pounds of various metals for eventual recycling, and then proudly surveyed my new blank slate. On the next day I'll begin rebuilding everything in a tidy and easy-to-maintain way.

Work is seriously underway and I am seriously excited. I have started having Construction Dreams again, and I can't wait to get back to the job site whenever I have free time available for work. In an upcoming article, I'll teach anyone interested how to do their own supply and drain plumbing using PEX and ABS pipes, using the bathroom as an example. It really is easy enough to fit most of it into a single blog post – a fact that the world's $80-per-hour plumbers will surely not be pleased to have revealed ;-)

** Remodeling tip of the day: if you're ever removing cast iron pipes from an old house, use a sledgehammer instead of a saw or grinder – it is both speedy and satisfying.*

Mr. Money Mustache vs. No Impact Man

By Mr. Money Mustache

Tue, 01 Nov 2011 12:00:25 +0000

The Triple M Family enjoyed a rather enlightening movie night tonight. These days, we tend to watch all our movies together, and we usually let the kid make the viewing choice, using the nicely organized browsing system on Netflix. Fortunately for us parents, our boy has graduated from the Pixar movies we've all seen a dozen times, on to science and nature documentaries, which all of us enjoy.

Today, however, we picked out a documentary called No Impact Man, which my son thought would be interesting because from the synopsis he determined that they were "like a super Money Mustache family". If you've never heard of the movie, check it out at https://colinbeavan.com/movie/

In a nutshell, the movie captures one year in the life of a real family. The guy, a writer named Colin Beaven, designs an ambitious experiment for the family to follow, involving advancing stages of minimalist living. They start by cutting out fossil-fuel-powered travel and long-distance-shipped food. They figure out ways to produce virtually zero trash and not buy anything other than food for a year. And they go further over time, eventually shutting off even the electricity to their apartment.

The part that was interesting to me was not the exact lifestyle changes they made, because I have already adopted most of them to some extent. It was the enlightening Mustachian Journey that they went through together – from an initial feeling of shock and deprivation, gradually through to realizing that many of the changes they made were better for them, regardless of the cost or impact on the planet.

Their starting point was quite amusing. The wife, business writer Michelle Conlin, came into the project as a reality television addict who also liked to buy pairs of $950 designer boots and several Starbucks products per day. Despite being only 40 years old, she was dangerously unhealthy due to poor eating and even diagnosed as pre-diabetic. "Mommy doesn't like nature" was one of the things she told her daughter early on in the movie. From my current perspective, it seemed like a desperate and tragic life, seeing these people crammed into a tiny apartment room watching reality TV shows on a gigantic television. But that's actually a normal life in this country!

Colin himself didn't have to make as many changes to become No Impact Man. He seemed to just dump the high-consumption lifestyle with no regrets, and most of his job was in managing the objections and complaints from the outside world.

An interesting part of the movie involves the considerable attention that they got, right from the start of the project. Their story was written up in the New York Times during the year of filming, which triggered invitations to appear on a long line of major TV shows including the Colbert Report. All of this attention triggered some incredibly violent rage from various complainypants critics who felt that making any lifestyle changes is a horrible idea and that people who try it should be punished.

I could really relate to this, even just being Mr. Money Mustache who has never appeared on a TV show. I have seen some mind-bogglingly Fuckwitted attacks that folks attempted to post into the comments section of this blog. I blocked them, of course, but I'm collecting them for an eventual article (or poem or hip-hop track or something). The same thing happened to No Impact man on a larger scale, and it really is bizarre because the dude is just trying to help us all out! There's no need to attack people like this – if you don't like his ideas, don't buy his book, and your problem is solved.

The real lesson, however, came as the movie went on. Michele became dramatically more Mustachian over time, and learned to love riding her bike, even with their toddler daughter in the back. They learned to cook at home for the first time, and started spending more time with friends and meeting new people outside once they gave up the daily time-waste of television. They became better parents. They became happier, and noticeably healthier as well. After the one-year experiment ended, they ended up keeping most of the new lifestyle (including foregoing air conditioning), despite the fact that many of the elements were considered hardships initially.

I must admit that the lifestyle in my own household is far from No Impact. We have a large 4-bathroom house, we use electricity freely, we eat food from all over the world, and we take car and even jet vacations. Mr. Money Mustache's whole deal is that even by just paying a tiny bit of attention to the details, I find that you can have the whole middle-class lifestyle with well under a third of the standard US level of consumption.

I still have an enormous stainless steel double-door fridge with blinking lights and an ice maker. But I bought it used for $500 and it fits easily within my 299 kWh monthly electricity use figure – electricity that is 100% wind-generated. I still have a nice reliable imported car, but it gets over 40 MPG and more importantly I still have a couple gallons left in the 10-gallon tank that I last filled in early August.

We still have everything we want and need and more, but it all adds up to only 25% of what most of our wealthy neighbors are spending per year. We are not heroes – in fact, we still suck and are consuming too much – but I think we're reasonable role models to start with because it takes very little thinking and lifestyle re-engineering to get to this point, even while the savings in both Earth and Cash are enormous.

The most significant difference between NIM and MMM was that the documentary made no mention of the financial benefits of their experiment.

After digging through their blog, I eventually found a passage stating that before the project, they were spending 100% of both of their salaries, and after finishing the project and going back to a “normal” lifestyle, they were suddenly spending only one salary and saving* 100% of the second one. So even without specific effort, they found themselves growing a Money Mustache. But I was surprised that the movie didn’t promote this aspect, since from my own perspective (and perhaps yours too as an MMM reader), it is one of the most obvious benefits of adopting a lower-consumption lifestyle.

Regardless of our different approaches, I am proud of No Impact Man, who continues to work in the field of Spreading The Good Word to this day. It seems to be a fun new dream job that he’s created for himself, a model for all of us in our post-real-career days.

*I was pleased to note that he actually referred to it as “Stashing” their second salary.

Two Unusual Internet Roadtrips

By Mr. Money Mustache

Wed, 02 Nov 2011 18:35:12 +0000

Hi there.

I have no actual article for you today, but I thought I'd share two other things that popped up on the Internet this morning.

First of all, I had the opportunity to take a virtual trip to Singapore, where Ellesse Chow, the editor of a website called "Goal Setting College" conducted an email interview with me to share the idea of saving for early retirement with her own readers. It was fun, and it was my first interview of any sort. Since Singapore is a far-away land for me, I figured this was a good way to test out the interview waters in a place where not everyone will see it, much like how Arnold occasionally does commercials in Japan to avoid wearing out his image in the US. Here's that interview if you are interested: http://www.goal-setting-college.com/success-stories/how-to-retire-early-and-live-well/

Secondly, someone made a nice Onion-style “Infographic” out of the [Cost of Commuting] article that I posted a couple of weeks ago. It covers the same information as the original article, but makes it sound much more exciting and important because of the giant fonts and pictures. Since it has a link back to MMM, perhaps this will start a second round of viral internet forwarding for that post (it has been read by about 70,000 people so far!)

How To Ride Your Bike All Winter – And Love it

By Mr. Money Mustache

Thu, 03 Nov 2011 12:16:49 +0000

Bike trailers love snow too

Yesterday, we had a second crazy fall snowstorm here in Colorado. The first one struck one week ago, and while it was fun at the time, I welcomed the warm sunny week that followed and returned us to normal conditions. But then, another storm came along and, DUMP, there were about seven inches of fluffy powder on all surfaces this morning. So while many of you are still enjoying lazy tropical temperatures in the Southern US and other warm places, some of us above 40 degrees latitude are actually starting to think about the approach of winter.

My son and I made the most of today's snowfall by biking to school as usual. I ride the bike, he rides in the trailer. We did some deliberate skids around corners and crashing through snowbanks, and he hooted and hollered through the whole 4-5-minute ride (a little under a mile). Bike trailers are actually very cozy for the passenger, because the velcro-closing front window blocks any wind and water, making it almost carlike inside.

When we got there, we found that we were the only ones who had biked to school. I was not surprised, since we have already established in an earlier article that Mr. Money Mustache is the most badass resident of Longmont. But my son was very pleased with our top-of-the-school status nonetheless*.

Although I like to joke endlessly about my own badassity, the truth is that riding a bike year-round is actually an incredibly easy and trouble-free thing to do in most of the world's populated areas. Even in the most brutal climates (I'm talking Siberia and Northern Canada here, not just balmy Minneapolis or Detroit), you can still crank out 8-10 months of it.

I'm not saying everyone should bike even when the snow is a foot deep, the snowbanks have eaten up the road shoulder and bike lanes, and the sidewalks are lumpy and unplowed. But these conditions only affect a tiny minority of the world's population, for a small minority of the days of the fall/winter/spring season.

I am astounded every time I hear a resident of the Lower 48 talk about how they can't possibly bike in winter, because in many ways it is easier than trying to drive a car. And in all ways, it is more fun.

My own winter biking experience began at around age 15, in a small town about 60 miles Northwest of Buffalo, NY. Winters are long, cloudy, and snowy there, and like everyone else, I assumed that bikes were only useful in summer.

But then I bought my first mountain bike using some of my minimum-wage earnings from working at the gas station. It was a bright orange Miele bike with gnarly wide studded tires and very nice quality components for the time. I bought it in late fall, and when it snowed I was eager to see how it could handle the conditions, so I took it out for a spin.

What I learned is that bikes do just fine in the snow. In fact, I had so much fun on that bike that a friend** and I were featured on the front page of the town newspaper with the headline “Teaming up for Winter Travel”. He was on a snowboard holding a rope which was tied to my bike, and I was providing the power to get us around town at high speeds.

Just as with a car, it’s all in the tire treads. A lowered Honda Civic with 18″ wheels and racing slicks will slide straight into the ditch when it hits the first inch of snow. But a stock Honda Civic with tall-treaded snow tires will clamp to the road and out-perform most SUVs running their stock all-season tires. Similarly, my road racing bicycle with skinny racing slick tires will topple when it hits any real snow. But my mountain bike sticks confidently to packed snow, floats luxuriously through powder, and smashes through snowbanks.

So we’ve established that grip is no problem, if you outfit your bike with nicely treaded tires. But what about comfort? Won’t you instantly freeze to death by even touching a bicycle if the outdoor temperature is below 68F or 20 degrees Celsius?

Yes, it can indeed be quite uncomfortable to ride a bike in cold weather. If you insist on riding in a bikini or a tanktop. Luckily for the rest of us, “Clothes” have been invented, which allow you to keep comfortable in any weather. I learned about “Clothes” by growing up in Canada, where they are required to survive the winter. Now that I live in a region of the US that does not have an actual winter, but rather just a season where the stream of warm sunny days is very occasionally interrupted by snowstorms, I regularly encounter people whose only strategy of dealing with cold weather is to hide in their cars. This is an inefficient, expensive, and wussypants habit, and it’s time to break it once and for all. Your car is for inter-city travel. Not for keeping your lazy ass warm during local trips just because you’re not smart enough to figure out how to dress for winter weather.

So with that long introduction, I will now reveal **Mr. Money Mustache’s Secret Wardrobe for all-weather cycling comfort**. This has been battle-tested in the slushy streets of Hamilton and the crispy arctic tundra of Ottawa, Ontario, and it obviously makes a mockery of the light chills of Colorado as well.

California Winter Nights Chilly: 50-68F (10-20C): All you need is some jeans and a sweater or light jacket. A nylon shell coat works well, since these can be fairly rainproof. Remember, you'll be pumping your legs and burning calories at about five times your normal rate, so you tend to be warmer when biking than you might expect.

Colorado Winter Days Chilly: 40-50F (5-10C): Now you add a normal hat (there are thin ones called "skull caps" that fit under a bike helmet if you like, although I prefer my Canadian Club hat that came with a bottle of Whisky I bought once), and some optional gloves if you tend to have cold hands. My hands are still comfy at this temperature, so I don't use gloves unless it's a long ride. Use a fleece sweater under your outer nylon shell coat now.

The Freezing Mark: 30-40F (-1 to +5C): Gloves become quite useful, and some people might throw a layer of thermal underwear under the jeans.

Winter Wonderland: 20-30F (-6 to -1C): You could upgrade the coat to a full ski or snowboarding coat if you like. If your face feels cold, you can use a scarf or a balaclava (shown in the picture with the word "Hind" on it).

Icicles In Your Beard And Nostrils Chilly: 10-20F (-12 to -6C): You might want to upgrade your shoes to some nice insulated hiking boots as I have in the picture.

Canadian and Russian Winter Chilly: (10F/-12C and below): The clothing above is very powerful and it is hard for any winter weather to defeat it. But for complete invincibility, I throw on my snowboarding pants over the jeans (and subtract the thermal long underwear since that would be overkill). This is an outfit that keeps me warm even sitting stationary for 10 minutes on a ski-lift at 13,000 feet in January with winds above 50MPH. So when doing something as relaxing as riding around on the city streets with such nice clothing, you'll be extremely toasty.

Most of my winter clothes are higher-end stuff from REI or similar mountaineering/outdoors stores – but I bought them all from REI Outlet during the 50% off sales where you get the odds-and-ends from the previous season for less. That Ground jacket, for example, still cost me $90 and is normally a $180 coat. I had never had such an expensive piece of clothing before, but damn, now I can see why the higher-quality gear costs more. It's worth it, because the higher comfort level encourages you to get outside more, and high quality clothing lasts much longer. The coat is over 5 years old, the Grandoe gloves are 10, and the other things are somewhere in between.. and they get used every day during the chilly season.

The nice thing about this clothing setup is that it is still worn right over your street clothes. Even in the worst weather during my working days, I would bike to work in the full outfit, then could strip the outer layers off within two minutes and would be dressed as a regular office worker. The time to dress up, and the time to strip down, is less than the time it takes a car driver to scrape off his windshield or find a parking spot or shovel his driveway.

The last issue regarding winter bicycling is that you'll often be doing it after sunset. Biking is not statistically more dangerous than car-driving (more on that in a future article), as long as you follow standard safe riding practices, and one of those is making sure you are just as visible as a car at night. Luckily, this is easy: A flashing red LED light mounted to your seat post, another one on your backpack if you like, reflective leg straps and standard bike reflectors, and a bright LED headlamp on your handlebars and/or your head. As of winter 2015 my favorite is the CycleTorch Shark 500 combo, because it includes a ridiculously bright headlight, not overly expensive, and recharges with any USB cord. But I added a second brighter taillight for even more visibility (and your own personal bike lane, painted in *frickin' laser beams*!): the Wolfride Race rechargeable.

Mrs. Money Mustache and I used to do the 35-minute uphill bike ride in the dark on our way home from work all winter, on fairly busy roads. We made sure we were a rolling light show when seen from any direction, and cars were able to see us from literally almost a mile away, because we looked like police cars. LED lights are cheap, bright, incredibly low in battery consumption, and indestructible, so there is no reason not to have some fun with them when setting yourself up for night riding.

I will admit that all of these steps, when taken together, do take an initial round of using your brain and putting in some effort. And I'll even admit that while you're figuring out the whole system, you might even experience **brief periods of discomfort** because you might be too cold or too warm and need to make clothing adjustments. But guess what? You don't score yourself a happier life by running from all forms of discomfort. It's just the opposite – you get happier by ramming yourself right up against obstacles like this one and then smashing through them.

You are NOT ALLOWED to stop riding your bike just because it is cold outside. So if you've ever used that excuse before, shut your whining trap, put on your coat and gloves, and I'll see you on the streets this winter – every day!

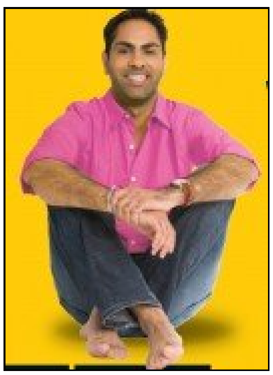
* Honorable mention goes to my friend Luc, who ran to school that day while pulling his daughter on an old plastic sled. Technically, that out-badasses biking.

** Coincidentally, this guy is now an MMM reader. Do you remember this story Adam ;-) ?

Book Review: Will This Guy Really Teach You to be Rich?

By Mr. Money Mustache

Sun, 06 Nov 2011 06:53:41 +0000



Part of my duty to you as Mr. Money Mustache is to research the entire field of personal finance and investing, and report back to you with any significant findings. We need to know if there are any competing ideas, bloggers, or book authors that have something valuable to offer us. We also need to know when there are silly and Anti-Mustachian ideas in circulation that need to be mocked.

So today I must make a little confession to you. Ever since I wrote the Frugality as a Muscle article back in June, I have had a secret obsession with Ramit Sethi. I think I really like the guy, based on his writing style and the fact that he makes everything exciting with his habit of thinking big. He's also quite hilarious, in that "witty and tenacious Indian guy who pokes fun at the tenacious nature of Indian people" way. For example, one of his primary pieces of advice for tricky situations is "Negotiate like an Indian". Another recommendation is that during a conversation with a friend in a coffee shop, you should turn and throw your muffin across the room so it smashes into pieces against the wall, then turn back to them with wide eyes and yell, "DO YOU DOLLAR COST AVERAGE!?!?!".

I feel right at home with this vibe, because many of my university friends and engineering coworkers had moved here from India and they had the same energy. And Mrs. Money Mustache herself is 50% derived from an Indian background, and thus even my son has scored a 25% share. Meaning we all get a refresher course in the whole Devoted Immigrant Entrepreneur culture whenever we visit her folks back in Canada.

Despite the many positive things I have to say about the guy, if Ramit Sethi and Mr. Money Mustache ever meet in person I fear a deep crack will form in the dry earth beneath our feet and a great chasm will open up, leaving Ramit tottering dangerously on one side while I stand solidly on the other. This is because of our deep philosophical divisions on the role of frugality and efficient living in a rich person's life.

To resolve all of my waffling between admiration and scorn (and perhaps yours as well), I decided to actually take the time to read his entire book, called "I Will Teach You to Be Rich". I wanted to see if he could convince me to change my opinion, if I spent ten hours poring over his masterpiece. So let's see what he had to say.

What it boils down to seems to be,

- Get out of Debt
- Set up automatic payroll deductions and bank account transfers so that you end up saving some of your earnings (including investing in index funds)
- Get in the habit of actually phoning your service companies (phone, insurance, credit card, cable) to ask them for better service and interest rates
- Get better negotiating and job-hunting skills so you can score better jobs and positions in your jobs

Doing useful things like these is called "Focus on the Big Wins", and his enticement is that if you do these things, you can afford to spend the rest of your money on the "things you love", guilt-free.

It all sounds sensible, and I believe Mr. Sethi deliberately made it a minimalist plan because his target audience is partly fresh-out-of-college kids with credit card debt and a Spring Break/Daddy's Credit Card/Bikinis/Jeep-Wrangler-With-an-Automatic-Transmission-Cruising-the-Strip-on-South-Padre-Island level of financial sophistication. He points out that since most people do absolutely nothing with their finances, and end up flushed down a toilet of debt, then by just learning these basics, you'll be better off than 90% of the population.

In many situations, I'd be happy to be in the top 10%. But when it comes to financial skills and early retirement, we need to move that decimal point over a few places to the left. Self-made financial independence at a young age is not difficult in this country… but yet I've noticed it is incredibly rare. That's why you're reading Mr. Money Mustache, right?

If I had kept my job and started a blog about how I was busily spending all of my nice office worker salary, nobody would want to read about it. But since I'm the one freaky guy who DIDN'T buy quite as many cars and televisions as everyone else, then it's a more interesting story. "Hey.. wait a minute.. you're saying WHAT happens if I don't spend all my money? I get to quit working and do whatever I want? Well shit, why didn't anyone tell me that before!?!"

But in this book, you won't find that option presented. Check out, for example the rough guide of how much of your money should automatically go to various places:

- Fixed Costs (rent, food, "car payments", internet, phone, etc): 50-60%
- Investments (savings): 10%
- Savings for additional special spending (vacations, wedding, downpayment on house): 5-10%
- Guilt-free spending on the things you love: 20-35%

Again I can see what he's getting at – saving 10% is better than what most people do – but by planting the idea that you spend 90% of what you earn, and only save 10%, he's automatically setting someone up for about a 50-year working career. Even if he moved another 10% from the other categories over to "Investing" to yield a 20% savings rate, you would have cut the career from 50 years down to 36.

Young minds are impressionable. You can plant the idea of Lifelong Firehose Spending, or a Big Money Mustache, and either one will take hold. I've heard from 18 and 19-year-olds that have just become excited about saving and investing instead of borrowing for that first 1.9% interest pickup truck they were previously interested in, and it warms my heart.

Just a few more quotes and facts from the book that illustrate our differences:

- "In investing, all we need to know is a few smart things to invest in, then we need to go away and let our money grow for thirty years"
- Even after becoming a personal finance blogger, he bought himself a new Honda Accord on credit with a 4.9% dealer loan
- A story is told about a friend with $3000 in credit card debt, who spends $650 per month going out to restaurants. The advice was to call the credit card company to drop the interest rate on the balance from 18% to 15% so that the balance could be paid off in 18 instead of 22 years
- He points out that [weddings cost an average of $28,000]. Then he provides a table of how to save for a wedding of this cost ($333 per month for 7 years starting at age 21).

I understand that the psychology behind some of the weaker ideas is, "People are just weak-minded flabby zombies and you can't expect them to exercise self control. The best you can do is to get them to make tiny, automatic changes to their lives. Baby Steps".

But I also understand there is some value to providing a good role model. Instead of telling people a few small tips, why not provide a complete role model that completely shocks people out of complacency, like the idea that you can become FREE 30-50 years earlier if you set yourself free right now from the idea that spending is a source of happiness?

"Spend on the things you love" sounds like a nice soul-satisfying message, unless you pause for a while and think, "Wait a minute – what if I don't love THINGS? What if I'd rather Spend *time* on the things I love, rather than spending large sums of money on them? What if my spending level and happiness are [actually completely unrelated?]"

So the personal finance part of the book is clearly Anti-Mustachian, just as I expected. At best, it should be called "I Will Teach You to Stay Out Of Trouble". But let's move on to the last third of the book – what I consider the good part.

Ramit is a super-hard-working entrepreneur. He comes up with neat ideas, plans and develops the shit out of them, then finds ways to package them up nice and clean and simple and get people excited about them. He demonstrated this skill first by applying for and winning $200,000 of obscure college scholarships to allow himself to go to Stanford University for free, then by starting his now-famous blog about six years ago, then writing a book that he pushed into massive popularity, not to mention making all sorts of entertaining YouTube videos and television appearances on big nationwide shows. Every time I look at his site, there is something else new that he's up to.

In the book, he shares some tips on how to apply the same attitude towards getting a job and negotiating a salary. There's a nice example about how one of his friends did really extensive background research on a company before going in for her first interview for a marketing position. She also had prepared three fancy campaign ideas and even practiced the presentation and the speeches with him before going to the interview. Because she did so much more than the other candidates, she blew them away and got the job and a huge raise. But the actual work involved was only about 30 hours – for a $30,000 raise. His quote on this type of activity is very wise: "It's the behind-the-scenes work that really makes you rich". It might be grueling and not very fun, but taking the time to truly impress important people with more influence than yourself, and then get up in their face so they can give you a helping hand upwards, really is the highest-paid work a corporate worker can do on an hourly basis.

It's just a matter of what you do AFTER that, that makes all the difference. By working hard and working smart, you can earn an ever-higher income. But a high level of income doesn't make you rich. A high level of *investments*, which work for you even when you are sleeping, and compound like a snowball on a steep hill, is what makes you rich.

Investments are equal to earning minus spending. If your spending goes up with your income, you don't get to retire any sooner.

So I'm sticking to my guns: work hard, save harder, become financially independent, THEN start doing the work you love for the rest of your life, without such a strong burden of materialism distracting you. You'll have the freedom to pursue your passion, and income will just be an interesting side-effect rather than a constant requirement.

Is the book still worth reading? Yes – especially if you are a financial beginner, and especially since books are free to those following the Mustachian way of using the library. I'd just suggest reading it with a side dish of triple M.

And even after all of this, I still secretly want to go eat chicken wings and drink beer with Ramit in San Francisco someday.

Get Rich With: Your Local Public Library

By Mr. Money Mustache

Tue, 08 Nov 2011 13:05:26 +0000

A few years ago, I learned the most shocking fact about public libraries:

Not everybody uses them!

"No!", you may say, "That's impossible – how else do people get their books?"

The scary answer that I discovered is that some people have developed a habit of *regularly buying books which cost them $10 – $30 each, reading them, and then collecting them on an ever-growing series of bookshelves*.

When you talk to a compulsive book collector, you'll hear things like, "Oh, but I just LOVE books. They are my guilty pleasure. I love the feel of them, the smell of the paper, the beautiful covers and the way they look all lined up on my bookshelf. I love just being able to move slowly along my bookshelf on a Sunday morning, looking at all the titles, picking out books I haven't read in years and sitting down and re-reading them, and blah blah blah"

I can relate to all these feelings, because I also get pretty excited when I walk past a big collection of books. I read whenever I get a chance, and I am overjoyed that so many books exist to provide me with a lifetime of unlimited learning and entertainment. The only difference is that I have several hundred thousand of them, and a paid staff who roams through my modern curved-glass 20,000 square foot book storage facility, automatically maintaining them and buying more for me constantly. I have so many books that I share them with everyone in my entire city, and we've even come to an agreement where we ALL pay just a few dollars per year each for the facility, and yet any one of us can borrow any of the books. By pooling our buying power together like this, everyone wins, and yet none of us have to waste space in our house storing books that we are not currently reading! We love our book sharing facility so much, we decided to call it the "Public Library".

I know the home-based bookshelf is emotionally attractive to many who fancy themselves to be intellectuals. But if you are really that smart, why are you paying dearly for something that you can get for free?

All of us probably know one of these people, who buys "just a harmless book or two every week or so from Amazon, because hey, it's only twelve bucks, and I'm a highly paid office worker, and I don't really have many other vices". But unless this person is already completely financially independent, he might eventually wake up and notice over ten thousand dollars leaking from his 'Stash *every ten years* from such a habit. A large book collection also amounts to a boat anchor of unnecessary belongings making future moves more difficult for you, not to mention the sizeable amount of natural resources that went into harvesting, printing, and shipping a thousand pounds of dead trees to your house.

But instead of the negatives of book collecting, let's focus on the positives of library membership. The Money Mustache family can speak from experience here, since we have become enormous fans of the place over the past six years.

My city's library is an unusually nice building, located in a scenic part of downtown. It's within a 7-minute bike ride of my house, which has nothing to do with luck – we picked our current location specifically to be close to the library as well as the school, grocery stores, and the rest of the city's amenities. Because of this nice proximity, all three of us tend to visit at least once a week on average.

It romances all of us and sucks us in by catering to every one of our interests.

A kid in a library is just as amazed as a kid in Disneyland. The children's section has thousands of kid-oriented books on all subjects, placed on low shelves encouraging them to dive in. There are also play areas, educational computers and games, and a gigantic model train set that was donated and maintained by a local model railroad club (i.e., friendly old dudes who still like toy trains and kids).

With no experience in turning to broadcast television for his storytelling entertainment (in fact, I'm not sure if he even knows it exists), Junior 'Stash naturally turns to books. He reads simple ones to us, and we read complicated ones to him. It really seems to add up over time – we've read him somewhere over 50 full-sized novels during the normal bedtime reading sessions, including most of the Harry Potter series and more recently Ender's Game.

Mrs Money Mustache heads upstairs and loads up her backpack with books about gardening, parenting, and intelligent-looking Lady novels with obscurely artsy titles and drawn-out and emotional subject matter.

I'll usually end up in the non-fiction section and get books about economics, investing, technology, social trends, as well as cheesy self-help books, construction guides, and on a special occasion a little bit of science fiction or action – like Snow Crash or Cryptonomicon by Neal Stephenson.

Between all of us, we tend to have 30 books checked out at any given time, and we make the most of the generous six-weeks-including-renewal holding period.

What a wonderful place. When you visit the library regularly, you start to notice that it's not just a local government service that lends you books. It's a place where the whole community of people interested in learning gathers together, secretly avoiding the TV and the shopping mall that gets the attention of everyone else. Local experts come in and give free talks in the conference rooms. People stop by to donate their recent issues of magazines after reading them. Volunteers raise and donate money and books. Surplus library books get sold off for a buck each. Little display tables get set up with currently applicable themes. There was a "peak oil" display recently with some articles, magazines, and books all laid out, free for anyone to sign out and read. And there is free wi-fi access throughout for those who want to just tune in and read on their laptop or phone.

Overall, you can get the equivalent of another complete University education in a different field, every few years, just by being a regular visitor and letting your curiosity lead you around. You'll learn new skills even while you enjoy the ultimate free leisure activity. All in a nice building surrounded by relatively cool people.

So your local library is much more than just your well-stocked home bookshelf. It's really a Temple of Mustachianism, at which you would do well to start worshiping if you are not doing so already.

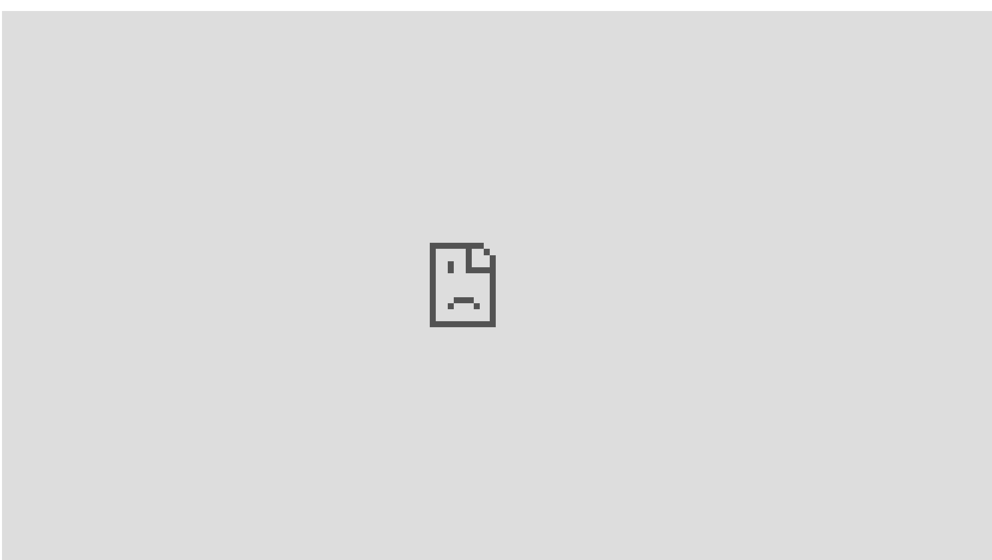
A Little Lesson on Gasoline

By Mr. Money Mustache

Wed, 09 Nov 2011 16:19:20 +0000

Just a little internet video today, that Mrs. M. stumbled across. It's a quick explanation for beginners on the life of gasoline before and after you use it for driving.

The lesson is obvious for the more environmentally-minded folks, but I figured it is still worth sharing because the average US driver doesn't think about much other than the numbers that appear on the pump display when they buy gas. In fact, this line of reasoning is so common that I ignored all external and social costs when I wrote up the true cost of commuting – figuring that there's no sense trying to make a point using information most people don't care about.



Even if the calculations in the video end up being imprecise, the real message is that when deciding how much gas to burn, the pump price should really be the last thing we think about. The first priority is burning the smallest amount that is practical.

I think of the cheap gas we have here in the US as a guilty pleasure. It is great for me personally that it costs virtually nothing to fuel a car. But I still don't want to waste it with loads of frivolous driving (or driving an inefficient car or truck) because I don't want to be a big douchebag towards everyone else and burn out the lungs of their children with Benzene and soot and flood them with rising sea levels.

I don't mean to get overly crunchy granola hippy on you here. You should think of this little post as a positive rather than negative message: by learning to live a more fuel-efficient life, you're mainly making yourself richer and happier. But you're also delivering an even bigger difference for everyone else in the world with each gallon you save. So you're becoming a Rich Mustachian – but you're also becoming a hero.

How Much is TOO MUCH in your 401(k)?

By Mr. Money Mustache

Fri, 11 Nov 2011 13:07:36 +0000

For all of its shortcomings, the traditional retire-at-65 system does have a few cushy benefits in the US. You get low-cost health insurance coverage through Medicare, a reasonable pension through Social Security, and you also get to start taking penalty-free withdrawals from your 401(k) plan.

This system was originally designed to accommodate people who would work through their entire adult life, and retire only when they had lost all ability to be productive, presumably to die just a few years later. In fact, the life expectancy of US males only reached age 65 around 1950. (Females reached that longevity in the mid 1940s, and both sexes only a hundred years earlier had expected lifespans of only 40 years!)

Books targeted at today's Late Retirees (which I define as over 60) speak quite excitedly about the new idea that people get to live for twenty or more years in retirement, and thus the financial planning is much more complicated than it was just a generation ago. So as you can imagine, those of us planning a 50+ year period of retirement need to game the system even more.

This is one of the things about which I get the most email questions. People are asking,

> Should I put money into my 401(k) if I'll be retiring much younger than the standard age? Won't I be hit with penalties if I try to use the money before then?

Let's review the basics:

- Through most jobs, you can contribute to a 401(k) plan – currently $16,500 per year and rising. You might even get a partial or full employer match, depending on how fancy you are.
- If your employer doesn't offer this option, you can still contribute up to $5,000 on your own to an IRA account.
- If you are self-employed, (which I highly recommend!), you can contribute up to $44,000 per year using the SEP-IRA or solo 401k options, and there's a nice description of their differences here.
- The government lets you make any of these contributions out of your **pre-tax income**, so you pay no income tax on that cash, or any of its investment gains over the years. This gives you a big savings boost, which is the whole reason 401(k)s and IRAs are useful.
- You'll still have to pay income tax on this money when you eventually withdraw it, but the idea is that you'll be in a lower tax bracket then.. because you will have quit your job and your only taxable income will be your 401(k) withdrawals.
- If you try to withdraw the money earlier than age 59.5, you'll pay the income tax mentioned above, PLUS a 10% penalty on top of it.

Assuming we want to avoid the 10% penalty, we early retirees have a few options.

Strategy 1: Treat the 401(k) as your "Old Man/Old Woman Money"

The idea with this strategy is to throw enough money into the fund, such that it becomes enough to live on for a good 30 years, from age 60 through 90. As a really quick calculation, say that you can live on $30,000 per year in today's dollars. And assume that you can safely withdraw about 5% per year from your fund from a combination of its investment returns/dividends and a bit of its principal. You would then need $600,000 of today's dollars, scaled up for inflation to whatever year you reach age 60, to meet that goal.

Let's say you are 30 now, and you've made the maximum contribution each year since graduating at age 21, and thus you have about $144,000 in the account. Let's also assume your investments can grow at 5% *after inflation*. What will it be worth by the time you reach 60?

The answer is of course 144,000 x 1.05 to the power of 30 (years). This is about $622,000 inflation-adjusted dollars (i.e., in the year 2041, it will buy you just as much as $622k does today). Since this is more than the $600k we calculated above, it could be said that **this person already has TOO MUCH in his 401k**, and now he just needs some dough to get him between whenever he retires, and age 60.

This is a simple strategy, and it's the one I took myself. Mrs. Money Mustache and I both let the 401k contributions run on autopilot when we were working, then promptly ignored them after we quit, where they have since continued automatically generating dividends which are reinvested in more shares every quarter. Besides the 401k contributions, we raked up some additional savings that went towards investments that provide for our current living expenses. Technically, this is sort of double-saving for retirement, but I like to think of it as a nice safety margin that allows you to loosen some of your other assumptions (like using a 5% withdrawal rate above instead of the 4% rule that serves as a general rule for sizing your retirement nest egg.

Strategy 2: Use the Roth IRA Escape Hatch Loophole

Don't go google searching that term, because I just made it up. But here's a trick I learned only recently from a fellow blogger named No Debt MBA:

- Build up your 401k and any other savings, then quit your job to begin retirement – hooray!
- You are now in a low tax bracket – you can actually roll over a chunk of your 401k into a Roth IRA account and pay income taxes on it at this point.
- Then you let it sit in the Roth IRA for a minimum of 5 years
- At this point, you can withdraw all of the principal (but not the gains yet, no big deal), penalty-free!

To be extra fancy, you could just roll over enough to cover your annual spending (say, $30,000) once per year into the Roth account, and pay the minimal income taxes. This would build a 5-year pipeline so that you would be able to withdraw an equal amount from the Roth account each year once you got the pipeline filled out. Of course, you also have to set aside money (or do some part-time work, or pay some 401k early withdrawal penalties) to get you through the first five years while you are waiting for the first batch to finish "fermenting". But it is still a definite loophole that can help you spring out your 401k money penalty-free.

Strategy 3: Use the Section 72(t) Early Retirement Grocery Money Loophole

The government provides yet another complicated-but-still-useful way to draw a little penalty-free income from your 401(k). You can set up a stream of payments to yourself, called "Substantially Equal Periodic Payments (SEPP)". The only hitch is that once you start them, you cannot stop them until you reach 59.5 years of age. To determine how much you can get, the government prescribes something called a "reasonable interest rate", which right now happens to be 1.43%.

The 1.43% number then gets mixed and mashed with some other complicated stuff about principal withdrawals vs. life expectancy. But the bottom line is, for each hundred grand you have in your 401k, your SEPP payment will be about $2900 per year, according to this popular calculator on the subject: http://www.dinkytown.net/java/Retire72T.html. That's some nice grocery money, but not a full lifestyle amount for most of us.

On the positive side, because you'll be drawing the money out at such a low rate, the odds are it will grow faster than you use it, leaving you a larger amount to tap more freely once you reach 59.5.

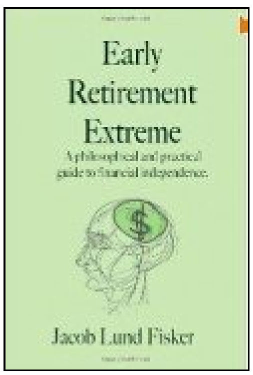
Overall, any of these strategies will work, but the issue remains the same for early retirees – because of contribution limits, your 401k will probably not be large enough to retire on until you've made at least 20 years of maximum contributions and seen some investment gains as well. So while I still advise **maxing out any tax-deferred savings accounts like the 401k**, you'll also need to invest elsewhere simultaneously. My own strategy was in Vanguard index funds, a paid-off house, and some rental properties, but you will surely find other places depending on your own interests.

Since I'm still over 22 years from 401k eligibility myself, I must admit that I haven't done a huge amount of research into even more advanced strategies involving tax-deferred accounts. Some of you are masters of this subject, so if you see any errors or omissions, let me know in the comments, and I'll continually integrate them into the article, so over time we will have a rather kickass "401k for early retirement" article.

Book Review: Early Retirement Extreme

By Mr. Money Mustache

Sun, 13 Nov 2011 04:19:02 +0000



There is a small but growing social movement spreading around the world these days. It started long ago but has been accelerating recently. Although this revolution is tiny when measured as a percentage of the population, it has the Fiery Heart of a Golden Lion and thus it gets an unusual amount of shock, admiration, respect, and jealous complainypants scorn when it comes into contact with the rest of our society.

I'm talking, of course, about the Early Retirement movement – (also known as "financial independence" for those who still subscribe to the old-fashioned definition of "retirement" as never doing any form of paid work again).

It's difficult to define the starting date of the revolution, because there have probably always been oddballs who realized early on that they could save and invest their money and then live off of the resulting income. But some mark 1992 as an important date in starting the modern trend, because that is the year that the book *Your Money or Your Life* came out. That book started spreading the idea that money isn't just for spending – it is really a form of life energy that you can keep for yourself in order to free up time.

Another big step in the Early Retirement movement was when Jacob Fisker, a fellow thirtysomething retiree, started writing his blog called Early Retirement Extreme back in 2007. By creating his series of highly detailed and analytical articles on the subject, I think Jacob was giving a clear voice to the financial independence scene that was not readily available on the Internet before that point.

Common financial wisdom, then as well as now, has been something like this:

> *"Obviously, modern life is very expensive, so you'll have to spend aaaalmost everything that you earn, no matter how much that might be. With the tiny sliver that you do manage to save, you must invest carefully for 30 years or more, until you get to a ripe old age and you have several million dollars of investments that allow you to continue spending just as much for the rest of your life! Cruise ships, wheelchairs, Cadillacs, and a $50,000 wedding for each of your twenty-seven grandchildren".*

Jacob's more logical voice of the Early Retirement movement instead said this:

> *"Obviously, we are all spending way the fuck more than we need to in the Western World and it is a complete waste of all of our time, energy, happiness, and the entire planet. So let's analyze our true needs as humans and figure out efficient ways to meet all of those needs. Then we'll enjoy our new more natural life while continuing to earn a rich-world wage for a few years. Since the earnings will be far more than our spending, we will save and invest it, and the work portion will quickly become optional"*

I am of course paraphrasing a little bit, since Jacob doesn't swear as often as Mr. Money Mustache does, but I added the f-bomb to make sure you knew that the idea was very important.

The interesting thing about the Early Retirement Extreme blog, (know as "ERE" by its followers in The Movement), is that it grew into an entire book by the same name. Mr. Fisker worked on his book on the side even while he continued blogging, collecting and refining his fanciest and most detailed writing on the subject, eventually publishing it in both paperback and electronic (kindle/pc/smartphone/whatever) forms.

And being both a follower and fellow preacher, Mr. Money Mustache realized it was essential to read this book in detail and report back with this Book Review for you.

If I had to sum up the Early Retirement Extreme book by inventing my own title for it, I would call it, "The entirety of human civilization and thought, expressed as a series of equations and graphs". It really is that broad-reaching, and densely packed. I had to read it carefully over a period of several weeks, because I found that individual sentences sometimes packed in multiple entire concepts, each one being the type of thing that I'd normally spend a whole Mr. Money Mustache article explaining.

Let's just take one random passage from early in the book:

> **The Cost of Specialization**
>
> It's obviously more expensive, both in time and money, for Person A and Person B to gain the required amount of knowledge in both fields X and Y than it is if A were to concentrate on X while B were to concentrate on Y. In this way, both can gain the same depth of knowledge in half of the fields, in half the time. Alternatively, they can get twice as much knowledge in the same field in the same time. It follows that the more a field is further split up into subfields, the less expensive this knowledge gets. These cost savings can be used to reach even deeper levels of competence (see this figure).

That's a complete explanation for why we all have such boring and unsatisfying jobs and lives in general, yet Fisker just brushes through the material as a quick background on his way to teaching you how to design your wardrobe ("Now create one outfit by drawing lines, for example, "black jeans #1", "Black socks #1", "Red sweater", etc.), and everything else, with scientific precision.

There is also plenty of philosophy. In the Kindle edition of the book, you get to see which passages other readers have highlighted. The most popular one is this:

> When you identify with an object, you're defined by the object, then controlled by it, and ultimately owned by it. If you relate to your possessions, you're owned by your stuff, and it will make many of your decisions for you. This trap is not only mental, but also physical.

Looking through all of the top highlighted passages, I see that the more emotional ones related to the thought that our society is crazy and we're defined by pointless materialism are the winners.

And indeed, those things are true even while they are very rarely acknowledged in the news or in conversations held between people who are not part of The Movement.

But my own favorite part of the book was in the description of the "Renaissance Man ideal". This is the idea that you will have the most enjoyable life, AND the best chance at very early financial independence, by developing a whole load of interesting skills. The amazing part is that these skills don't just sit independently in your mind like a bunch of unused kitchen appliances in a pantry. They start to reach out and connect to each other in unexpected ways, and start solving all of your problems for you. They build your curiosity and start sucking in still more skills that you can't help acquiring. And before you know it, you are able to live a superb life on only a tiny fraction of the spending that a normal person does, even while you might end up accidentally earning money even more easily than before you embraced the Renaissance Ideal.

This section of the book put into more advanced words the same thing I have been raving about on this blog, which is the idea that you should insource rather than outsourcing whenever possible. I stumbled only accidentally across this idea when I quit my specialized software job and started the house building company. The range of activities and people I became exposed to, when going from a lonesome cubicle software developer to a small company owner, changed everything. Since then, a chain reaction of useful new experiences continues to this day. And I have at last learned to appreciate the chance to learn new skills instead of dreading them (because these opportunities often come disguised as big hassles that you have to deal with unexpectedly at various points in your life, and you have to saw your way through the big smelly log of Dung to get to the golden nugget of opportunity hidden deep within).

So it's a valuable book and if you read it carefully, it will definitely teach you new things. I will, however, throw in a critical side to this review. And that is just that the book is a little bit serious for my tastes. The engineer side of me appreciates having things laid out with the utmost in logic, just as I loved pretty much everything that Spock and Data ever said on the Star Trek shows. But the rest of me thinks that we need to have heart-touching personal stories, satire, mocking, and plenty of foul language if we are going to make a point. (On the other hand, it is nice that this particular market niche has been left open for Mr. Money Mustache to fill!)

Therefore, the ideal reader is probably a well-educated person (i.e., not a Dave Ramsey or Mister Money customer). Perhaps a Silicon Valley worker who is currently spending most of his enormous salary and needs to hear a well-thought-out counterargument to his current assumptions about life. Or maybe even some of my own friends and former coworkers.

Regardless of the style, this is a book like no other, and that alone may make it worthwhile checking out. And the author is a good guy, making an outsized contribution to the rich world by challenging its very foundation. So he maintains his status as a Grandfather of the Mustachians.

You can pick up electronic or paper versions of the book at Amazon.com if you want to dig deeper into the Early Retirement movement, even while you support a valuable piece of work.

Eulogy to a Great Dad

By Mr. Money Mustache

Mon, 14 Nov 2011 16:00:19 +0000

I normally wouldn't share a personal email from an MMM reader, but yesterday I got a really inspiring one about what it means to lead a good life as a parent, and I asked the writer's permission to publish it and he agreed.

I think it's a great one to share because it shows the impact a Dad can have on his kids by leading an honest life, and how the values he lives by, rather than the amount of material things he buys in the process of supporting a family, are what counts. All of us who are dads need regular inspiration to keep our priorities straight in our most important job, and this guy provides a mountain of it.

> Comments: Hey Mr. Money Mustache,
>
> Back in August, my dad passed away at the too-young age of 62. However, in the decades before he died, he made damn sure that he was free to pursue whatever career he wanted and leave just as quickly if need be. By living simply, buying things with cash, and laughing in the face of the lure of material goods, he raised seven kids while my mom was able to stay home and take care of us.
>
> He sold cars honestly, and when they told him he couldn't do it that way anymore, he gave them a wry smile and with his signature sarcastic goodbye salute went to run a soup kitchen. When the soup kitchen board told him he had to start collecting the personal info of all his clients, he said "I'm not going to take the last thing some of these people have left." He then started as a substitute teacher to evaluate a teaching career, and when it turned out the school district requires teachers to pass a certain number of students, even if they were failing,

> he reckoned he couldn't do that either. However, he saw he could make a difference in the lives of some kids by sticking around as a sub. When the cancer finally won, hundreds of students called, emailed, brought food, and came to the funeral to let us know how much their lives had been changed by one simple old man.
>
> He taught his own kids how to raise our own funds through smarts and hard work. So we bought our own vehicles (I opted for the bike and made bank doing that) and paid for our own educations. He taught us how to fish and grow food so we would never starve. He taught us how to live so that we would never have to sacrifice our integrity or do wrong to others to make ends meet. He taught us how to take what we have and make a difference in this crazy world.
>
> I just want you to know that I found your blog about a month after my dad passed. Every new article you write is like being able to sit down with him again and listen to him cut through the world's bullshit with an easy knife of humor once again. Thanks for giving me that, and thanks for the lives you're most certainly influencing for the better.

Thanks very much to the guy who sent me this and allowed me to share it. I'm obviously not deserving of the favorable comparison in the last paragraph, but I can use it as inspiration towards a longer goal – that of earning even half this level of respect from my own son by the time he's an adult and I'm an Old Man.

Foreclosure Project: Increasing Profits with the Recycled Building Materials Store

By Mr. Money Mustache

Tue, 15 Nov 2011 13:42:46 +0000

You may or may not have noticed that I've been typing articles a bit less frequently in recent weeks, and that is for good reason: I'm doing real work these days!

The foreclosure project is going extremely well so far, both when measured against the original schedule and budget, and when measured on the fun-o-meter. We've had a few interesting design inspirations that should make for a nicer interior and exterior feel than we originally anticipated, which may lead to a higher rental income than the original budget as well.

The work completed so far:

- Tearing down a portion of a wall to create a more open feeling between the living room and kitchen
- Using a car jack to lift up the floor framing and adjusting some old support columns in the crawlspace to straighten a crooked floor

- Framing new doorways between the bathroom and each of the two bedrooms
- Removing all of the old ice-damaged copper pipe plumbing and rebuilding a nicer system with PEX pipes
- Removing the cast iron and lead drain plumbing and rebuilding with ABS pipes
- Clearing out the old bathroom toilet, tub, sink, and floor, reinforcing the subfloor, and building a new concrete showerpan as part of a fancy new corner shower. And adding the associated plumbing for shower, toilet, and sink
- Creating a new area for the laundry machines (which mostly means new supply and drain plumbing), since they were previously jammed into an awkward corner near a bedroom window)
- Swapping out old cracked and painted plugs and switches for new ones throughout the house
- Starting to build a new kitchen shelving/countertop unit
- Adding a nice new front door

I've got a few interesting how-to articles in the works to document how some of these things were done, but I figured I should tell the renovation tale in chronological order, which starts with shopping for the materials needed to rebuild this run-down house.

When you do a home renovation project, the materials are a huge part of the cost – both to your wallet and to the Earth. A project like this requires windows, doors, plywood, studs, tiles, concrete, lighting and plumbing fixtures, and many other things.

The interesting thing about renovations, at least in the wealthy Boulder County area where I live, is that people are always doing them. Middle-income people buy 60-year-old fixer-upper homes and build them into more comfortable and energy-efficient places to live. Upper-income people often buy higher-end homes and make major changes even when the houses are quite fancy to begin with. Meanwhile, commercial buildings are always being built, torn down, and remodeled by larger companies.

The result of all of this activity is a huge surplus of building materials. Extra tiles left over from someone who bought too much for his bathroom.

Entire kitchen cabinet sets and high-quality windows and doors from the homes of rich people who grew tired of the current layout of their house and had it rebuilt. Even unused beams and industrial-grade components from office construction projects. And of course various fixtures and parts of every type.

These things end up either on Craigslist in the "[materials]" section, or in the recycled building materials store. There is [one of these stores in Longmont] where I live, and [one in the neighboring town of Boulder], and my house-renovating partner and I decided to hit up both of them to see what we could salvage for our project. And it was quite a score, since in just one trip we acquired these items:

A beautiful heavy-duty solid wood front door (with 12 panes of glass in a grid formation) for $20 (roughly comparable to a $400 door at Home Depot)
A set of four double-pane 2ft x 3ft window sashes in new condition for $4 each (to be used in the garage) (value about $300)
About 80 square feet of tile for 50 cents per square foot (total $40, worth about $200 new)
An apparently unused and very nice toilet for $30 (new value about $140)

The total spending on this trip to the store was $106, for materials we actually needed, that would have otherwise cost $1040. A savings of over 900 bucks, just for embracing the idea of used rather than new materials, and knowing where to shop!*

The limitation when buying your materials second-hand, is that you have to adapt your project to fit the materials, rather than custom-ordering the materials to fit your project. But that is pretty much a core concept of the Mustachian Way, so it is good practice for life in general.

For example, the new front door was the standard 36″ wide.. but the old door was only 32″. This worked out well, because you really should have at least a 36″ door in a house anyway, in case a future resident needs to move in a large refrigerator or couch. It is also necessary to allow someone to roll a wheelchair through comfortably. So today I cut out the old door and part of the wall, and framed a new wider opening into the front of the house. It took quite a few hours of cutting, routing, nailing, and even occasional swearing, but it was VERY satisfying to hear my heavy new door click precisely into place, fully weatherstripped and insulated, as I locked up the place to go home this afternoon. And the whole house now looks better when viewed from the street!

Since the recycled building materials store runs on donated items, not everything there is suitable for use in a high-quality renovation. The windows and doors are surprisingly good, as are the tiles and toilets and some of the kitchen cabinets. But the appliances, lighting, and plumbing fixtures are usually things like green or almond-colored fridges and stoves or gaudy brass faucets. For these things, you simply move on to Craigslist materials.

Even after passing through these two steps, I still end up purchasing plenty of new things. Wood, nails, adhesives, shower valves, plumbing, and many other things are rarely available used.

But by getting some of the most expensive things from these alternative sources, you are really "focusing on the big wins**", and shaving thousands off of any renovation project budget.

* Still think we're going to have trouble with our profit margin, Joe? ;-)

**I wonder if Ramit Sethi shops at the used building materials store?

An Online Forum for Mustachians on Reddit

By Mr. Money Mustache

Thu, 17 Nov 2011 18:46:06 +0000

Hey, just a quick note while I'm running around cleaning up the house for a big family visit:

Some cool person (it wasn't me, honest) started a new category on the excellent online forum site called Reddit.

If you haven't heard of Reddit, it is a place where people gather to ask and answer questions on a certain topic and help each other out. They also share links from around the web on that topic, and the whole collection of ideas gets democratically sorted out by You the Readers using a simple system where you click on an up arrow if you like something, and a down arrow if you don't

I have been a Reddit reader and occasional writer for some time. I was following the "personalfinance" and "frugal" areas. But recently, a category called "financialindependence" was added. I was honored that the Mr. Money Mustache blog, along with Early Retirement Extreme, was listed as one of the inspirations!

This forum is just getting started (it has about 500 readers right now), but it is a good place to brush up on your Early Retirement skills. And you will probably get faster answers to specific questions than you would get directly from me through the contact submission form, since I am embarrassed to say that I have about a week of them piled up waiting to answer right now :-(

Anyone can read freely without signing in, and you can create a username and password for yourself on Reddit if you want to vote and make your own posts.

Here it is!

http://www.reddit.com/r/financialindependence/

A big thanks to the Reddit user named triestoohard for starting this helpful category, and for the kind mention in his introduction.

First Understand, then Destroy, your Home Heating Bill

By Mr. Money Mustache

Fri, 18 Nov 2011 12:58:25 +0000

A $40 insulation job on the garage door of my previous house saved hundreds of dollars of fuel. And made the garage a much more pleasant place to work.

We've all read the tips in the newspapers about how to reduce our heating bill. Turn down your thermostat and get a programmable one. Seal your air leaks. Add insulation to your attic. Blah blah blah.

It's boring, but it's powerful advice, because US households spend an average of about $960 each per year keeping themselves warm. That's three months of grocery money for a family, pumping heat into a leaky sieve that could actually have been built to require much less, or even no added heat, depending on the location and climate.

So while the *USA Today*-style heating articles are good enough for those readers, they're not good enough for us. I don't just want to lower my heating bill, I want to Destroy it. My eventual goal for any house I settle down in for the long run is to make it require no fossil fuel energy to keep it warm all winter.

To understand heating, you must first know what you're paying for. Heat is often measured in BTUs, British Thermal Units. 100,000 BTUs is referred to as a "therm" on my Natural Gas bill, and a therm currently costs about $1.00.

Then you must understand how you are losing your heat. The most important form of heat *loss* from your house is something called thermal transmittance, also known as U-factor. This is really just a number that means "how leaky is this material", and it is based on the leakiness of a single pane of glass.

A single-pane glass window has a U-factor of 1. In English units, this means that each square foot of glass leaks out one BTU of heat per hour, for each degree Fahrenheit your house is warmer than the outside air.

So when you're looking through a giant 10×10 foot window (100sqft), from a 70F room out into a 0F deadly-cold wintry blizzard, your window is leaking out 100 x 70 = 7,000 BTU per hour of heat into the night. That's 7 cents per hour or $50.40 per month of heat *from that single window*.

The "R-value" you have probably heard about is simply the inverse of the U factor. That means 1 divided by U equals R, and 1 divided by R equals U. You've heard of R-13 wall insulation, right? The U-factor of that is 1/13, or 0.08.

With that knowledge, we can move up to understand the heat loss of an entire house. A 1000 square foot house probably has an outside surface area of about 2000 square feet including the roof. If it has standard R-13 wall insulation (and no windows for this example), and the temperature inside is 68F, it loses how much heat on a 32 degree day?

2000 square feet x 0.08 U-factor x 36 degree temperature difference = 5760 BTU per hour = $1.38 per day.

“Hey, that’s a pretty cheap gas bill for a whole house in what sounds like a pretty cold climate”, you say. But wait, it gets even better.

Imagine this household uses the same amount of electricity as me, about 299 kilowatt-hours per month, equivalent to 415 watts of average continuous use. How much heat does this electricity use add to the house? The answer is 1416 BTU per hour.

“What? You were just talking about home heating, and now you are talking about electricity.. aren’t they two different things?”.

No, it turns out they are actually directly related. Almost all of the electricity you use in your house ends up being converted to heat, with 100% efficiency. Your light bulbs give off heat and light, and the light bounces around the room and eventually gets absorbed by the walls and turns into a tiny amount of heat as well. Likewise for your appliances, your computer, etc.

What this means is that any electricity you use in the heating season provides some of your heat, and reduces the amount your furnace needs to provide. The only exception to this rule is electric appliances that vent their waste heat outside, such as a clothes dryer or exterior lights. But we don’t use clothes dryers, right?

So let’s go back to the 1000 square foot house. It needs 5760 BTU per hour to stay warm, and it gets 1416 of those BTUs just from the electricity you use while living there. So you’d still need the furnace to stay warm.

But what if we increased the wall and roof insulation to R-53? That quadruples the insulation, which cuts the heat loss in four. And guess what – you have a self-heating house!

Practical Example: the attic of this house is 1000 square feet. We want to quadruple the insulation from R-13 to R-53. To add the extra R-40, you’d simply have to blow in about 12 inches of cellulose insulation. This would take 61 bags of the stuff, which costs $610 before tax credits.

Adding $610 of insulation to your attic is saving you about $15 per month of heat in this situation – $60 per year over a four-month heating season. It will also cut your air conditioner use. So it's at least a 12% annual return on investment, forever.

The self-heating house is the holy grail of home heating, and this is the way houses in many parts of the US *could* be built to destroy their winter heating bill. With proper design, the cost of the extra insulation would be small compared to the energy savings. Changes like this are really coming – the 2003 and 2007 international building codes, which most cities and towns adopted for all new construction, have much higher insulation standards, meaning lucky homebuyers in the future will have much lower costs.

Now, my example was kind of silly, because the house was just a simple 25×40 rectangular box with no windows. What if we add windows?

Good double-pane windows have a U-factor of about 0.3. If the sample house has eight 3×5 windows (a total of 120 square feet of glass), this adds a heat loss of about 1296 BTU per hour. D'oh! There goes almost all of the free heat we get from our electricity! How can we recover? Luckily the windows come with some good news too.

Solar gain at work in MMM's room. Shutters

open in day,
closed at night.

Let’s say the smart designers of this house put two thirds of the windows on the South side of the house. The sun shines an average of five hours per day in this region, delivering 1000 watts per square meter (90 watts per square foot) mostly onto the side of the house. The windows let a certain amount of this heat into the house, based on their **solar heat gain coefficient**, which is usually around 0.3, or 30%.

There are 80 square feet of glass on the South side, getting hit with 90 watts per square foot of light, and 30% of the heat makes it into the house. This is 2160 watts of heat for five hours, or 36,850 BTU of heat per day shining in. Averaging this over the 24 hours of a day, your house now has an extra 1535 BTU per hour of heat coming in, just from the South-facing windows.

The lesson is: having 2/3 of the windows facing the Sun more than made up for all of the house’s total heat loss through all of its windows!

Rule of Thumb: Each 3×5 window facing South gives you about $2 per month of free heat (in a moderately sunny climate).

You can drastically improve the performance of your windows by using shutters or curtains on them. Open them when it is sunny, and close them at night and even on cloudy days if you wish. A tight-fitting curtain or honeycomb blind, or better yet a set of interior shutters, can cut heat loss through the windows in half again. Just remember to open them back up when the sun is shining in the window.

The final easy thing under your control is the interior temperature. As we’ve seen above, the heat loss from your house depends entirely on the difference between the interior and exterior temperature.

Supposed that I lived in San Francisco, where the average winter temperature (day averaged with night) is a moderate 50 degrees Fahrenheit. If I keep my house at 50, I will need to add absolutely no heat to it to keep warm. If you keep your house at 70, you will need some heat, and if someone between us likes 60 degrees, she will use exactly half of the amount of heat you use.

So when you drop your interior temperature, it saves you some cash. Even if you just let it fall for a few hours while you go out for a walk or while you're at work, it still saves heat because you are lowering the average difference between interior and exterior temperature.

In my climate in January, the day/night temperature averages to 30 degrees. If an average person keeps his house at 72F (a 42 degree difference), and I keep mine at 67F (a 37 degree difference), my gas bill will be about 12 percent lower than his. If I further lower my average by dropping the temperature at night to 60F, I can save an additional 8%.

Lesson: Running your house at 67F during the day and 60F at night will save you about 20% on your gas bill compared to a house that runs at 72F around the clock.

So we have covered the big three: insulation, solar gain and window loss, and interior temperature. With the right combination of these three things, and enough thermal mass to keep your temperature nice and constant, you can have a self-heating house.

The MMM family house is not a trivial one to heat, so it has no yet attained this status, but I am getting there. It's about 2600 square feet in size, with 1800 of that above the ground. There are about 30 exterior windows and doors, some of them pretty big, and they are not (yet) all that well optimized for capturing solar heat. And most significantly, it houses a lady of Indian descent and a young boy, who both become quite unhappy if the interior temperature drops below 67 degrees Fahrenheit (19.5 Celsius) during the day.

I have made these changes so far, with the approximate annual dollar savings listed alongside them:

Added 20 bags of blown-in insulation to the attic: $25
Insulated the steel double garage door: $25
Using 10 insulated shutters to close second floor windows each night: $50

Opening shutters on 6 large south-facing windows to capture solar gain: $50
Covering large rarely-used basement windows with removable insulated plugs during winter: $20
Running lower interior temperatures, especially at night: $80

The total savings so far are about $250 per year, meaning the heat bill was $650 per year when we moved in here, and now it is $400. That's a 40% drop. Some of the remaining 60% can be wiped out like this:

150 square feet of solar gain glass on South side (nearly free from recycled building materials store): $80
Much more insulation in the part of the attic I didn't get to yet: $50
Insulated shutters for the large remaining windows: $50
Solar collector on the roof for domestic hot water and radiant solar heat: $50.

That cuts the bill down in half again to $200 per year. But after that, I'm out of ideas. Our current house is not an energy-efficient design to begin with, so it is difficult to get it fully self-heating. More changes could be made, but they would become more exotic and thus cost more than they delivered in savings. A future home of ours someday, however, will learn from the limitations of this one and have natural heat built in right from the drawing board. Perhaps yours will too!

Update: *This article was written way back in 2011. A couple years later, we moved to a "new" house (actually a 1959 house which I bought then rebuilt nearly from scratch). It is a smaller place with a much better orientation to the sun, and I used all of the principles in this article. As a result, it is much closer to optimal, getting nearly all of its heat for free and requiring no cooling in summer. An dream come true for both engineers and nature lovers, since the view is all sunshine and trees from most rooms.*

Bonus Points: After I skimmed the surface with this article, the readers posted a bunch more useful energy-saving techniques in the comments below. Check them out for more learning, especially Brian M's comment about sealing leaks in an older house. Air leaks are even more important (and cheaper to fix) than insulation, so if you still have any of these around, fix 'em.

The Connection Between Trash and 'Stash

By Mr. Money Mustache

Mon, 21 Nov 2011 13:30:58 +0000

 I've noticed a little pattern recently, and I thought it would fit right in with the things we learn about here in Money Mustache School, so I'd like to share the story with you.

Tuesday is garbage day in my neighborhood, and that means everyone will be rolling the enormous 96-gallon bins provided by the city, down to the curb. Most of these will be quite full, with about a quarter of them so full that the hinged lid pokes up at an angle, as if in a big dumb salute to Ultimate Wastefulness.

If you've never seen a 96-gallon plastic container, it is quite a sight to behold. You could easily hide the entire MMM family in one of these things, or several hundred pounds of various kinds of waste. If you filled it with water, it would weigh 800 pounds. When I'm in the middle of a construction project, I find that I can fit an entire bathroom's worth of renovation debris into the thing easily.

Although the sheer size and weight of this container would take two strong people to lift when it is full, my city is able to empty thousands of them per day, thanks to a fleet of very sturdy tractor-trailer trucks with hydraulic robot arms on their curb-facing side. The truck roars up to your house and brakes aggressively to a stop, and the robot arm effortlessly picks up the 200-pound container as if it were made of styrofoam, hoists it 16 feet in the air and dumps it into the top of the truck, then slams it back to the curb. Then the truck's 400-horsepower turbo diesel engine goes straight to full throttle and accelerates the 30,000 pound load of truck and trash for a few seconds before burning the energy back into the brakes and stopping at your next-door neighbor's house to repeat the process*. This cycle repeats all day, every day, since it takes seven days to make the rounds of the city, by which time it is time to begin anew.

Other than my occasional guilty habit of generating construction debris by renovating other people's houses, I find that the 96-gallon container would hold between three and six months worth of our normal household trash. In fact, as a way of saving the 30,000 pound truck some gas, I only put our container out to the curb when it gets full, which is once per season or once per construction project, whichever comes first.

Expressed as weight rather than volume, I've measured our total trash at 2-10 pounds per week. The average individual person in the US generates 22 pounds per week, meaning you'd expect our family of three to be rolling 66 lbs to the curb every Tuesday. So when comparing both weight and volume to our neighbors and the EPA website above, we seem to be throwing out about 90% less stuff than normal. What gives?

First of all, Mr. Money Mustache is not a holy zero-trash saint like the No Impact Man. I often get ribbed from my own readers in the comments about leading a relatively decadent life.

On the other hand, it does annoy me every time I have to heave something I bought into that big black bin, and this definitely affects my spending patterns – I try not to buy things if I can foresee any part of them ending up in the trash. Since I feel unhappy when throwing things out, I become happier when I avoid this activity. And thus, it is yet another way buying less stuff ends up building happiness – which luckily happens to be perfectly aligned with becoming financially independent as well!

With that justification, I now present

Mr. Money Mustache's Top Four Ways to build Stash while Reducing Trash:

1. **Think carefully before making purchases that will end up in the trash.** Very carefully. Disposable diapers for your baby? Forget it. Cloth diapers are just as easy, a thousand dollars cheaper per child, and a thousand times better for the environment. Paper or styrofoam cups and plates for that picnic or dinner party? Give me a break, use your real damned dishes and then smile when you wash them instead of crying when you have to throw them out. Packages from products you buy? Maybe for the first year after you buy your first house, but after that, you really don't need many products, especially since your products will come mostly from Craigslist, where someone else took care of the package for you. Fast food packaging? Stop making me laugh so hard, because it has become difficult for me to aim my fist properly at your face!
2. **Recycle what can be recycled.** This isn't a perfect solution, so you shouldn't feel great about having a full recycling bin. But at the same time, it is obvious that you will end up with some bottles, jars, and cans from leading a modern and convenient life, and these things must never end up in a trash can, regardless of where you are.And obviously, none of these will be bottled water containers or other frivolous things that could have been obtained without packaging if you thought about it properly, right? Larger chunks of metal like old patio furniture, lawnmowers, appliances, or water heater tanks can either be brought to a local scrap metal company (which may even pay you for them), or donated to the recycled building materials store.
3. **Food Waste Is Not Garbage.** As heavy garbage producers read the introduction to this article, they probably thought, "man, I could never let my garbage can sit for 2 months before emptying it.. it would stink to high heaven!". But while my own trash is not a pretty sight, it still doesn't actually stink very much, and that's because it's just the little

plastic wrappers and lids and chunks of styrofoam that aren't accepted by the recycling company.Where do my apple cores and banana peels and coffee grounds go? **Into the Compost pile, of course!** If you live in a house rather than an apartment, you should be composting all of your food, along with your leaves and garden scraps. Look it up – it is literally as simple as choosing a corner of your yard and throwing everything into a pile.My Mum taught me this when I was just a tiny boy, and I have followed the tradition for my entire life. It turns into rich soil very quickly, which you use in your garden. Mrs. Money Mustache just harvested FIVE wheelbarrow loads of Black Gold from our compost pile last week to make more gardens. If you are fancy or have problems with animals snooping in your compost pile, you can upgrade it to a box or barrel.
4. **Messy families like mine benefit from cloth napkins.** A few years ago, I noticed that a big portion of our remaining garbage was white paper napkins, used to wipe faces and tables and countertops after various eating and spilling activities. Then I noticed that the local New Orleans-style restaurant just has a little box of rectangular pieces of scrap fabric on each quaint tabletop, instead of paper napkins.Eventually, we put two and one together and cut up a bunch of attractive fabric scraps to make our own napkin supply**.. and since then, we've never bought a paper towel or napkin (although I'm still working my way through a roll or two that were left over from that era, for really oily stuff like bacon grease).

On the surface, these may just sound like Trash saving techniques, but I find it's more powerful than that and there is a positive 'Stash component as well.

A Mustachian's wealth comes in equal parts from being an optimistic producer who earns a great income, and from being a stubbornly efficient user of this income who refuses to see it go to waste in such an obvious way as the Big Black Bin.

—

** I'm actually working on a letter to the head of the sanitation department of my city, since my calculations show if they asked the driver to slow down* *the peak speed by 4MPH, the fuel savings would be much greater than the extra salary and benefits to pay the worker for more hours. So we'd be saving the city money AND creating more local jobs. The trucks would probably last longer as well, needing fewer brake jobs.*

*** I think this box of cloth napkins was Mrs. Money Mustache's birthday present to me for something like my 35th birthday. Best gift ever!*

How to Become a Kickass Plumber – with PEX

By Mr. Money Mustache

Wed, 23 Nov 2011 13:02:47 +0000

 Foreclosure Series answers the question:

> "How can I profitably maintain or fix up a bargain-priced house for eventual rental or resale, when it costs so much to do things like plumbing repairs?"

When I was a 21-year-old just beginning an engineering career, I had no desire to become a plumber. "A plumber is an old guy with a beer belly who fixes leaky pipes – where's the appeal in that?"

Five years later, I was a new homeowner, and a blast of cold weather cracked the pipe that ran to my garden hose faucet. I tried to find a plumber, and couldn't get anyone to return my calls. So I had to figure out how to fix it myself.

Five more years later, I was hiring subcontractors to help work on my housebuilding company's first custom home. I gathered bids for the electrical, drywall, furnace, and plumbing work. They were all about $12,000, so I assumed all of these jobs were an equal amount of work.

The electricians worked for a week with a large crew, and provided thousands of dollars of fittings, light fixtures, circuit breakers, and expensive copper wire. The drywallers worked even longer and put up tens of thousands of pounds of drywall in all sorts of awkward places, then meticulously plastered and sanded the joints. The HVAC crew brought along a high-efficiency furnace and air conditioner, and put in even more hours.

But the plumber showed up with just one chain-smoking assistant and a few duffel bags of parts and pipes, and had the whole place done in less than a week before presenting me with the $12,000 bill. “What the heck?”, I thought, “Why do these guys earn so much money for so little work?”.

As a homeowner, you’ll run into the same situation. Plumbers routinely earn $100 to throw in a toilet, hundreds more to replace a sink or faucet, and thousands if you dare ask them to provide the plumbing for a new bathroom. I’m not knocking my fellow tradesmen, I think it is quite cool that they have somehow carved out a niche where they are able to charge over $80 per hour for manual labor. But if you’re going to own your own house, and want more power and less poverty, you should definitely learn to do your own plumbing, because it is easy and fun.

The technological revolution that made this activity drastically *more* easy and fun was the replacement of soldered copper pipes with flexible reinforced polyethylene pipes. These are commonly referred to as PEX (short for Poly-Ethylene-Crosslinked).

The benefits of PEX over copper include these:

- drastically cheaper pipe (20-26 cents per foot for PEX vs. over $1.00 for copper)
- faster cutting (5 seconds with a ratcheting scissor tool vs. 30-60 seconds with a hand-cranked wheel cutter)
- faster joints (10 seconds with a crimping tool vs. 2 minutes with a torch and solder)
- no dangerous flames (almost all plumbing is in tight places near electric wires and gas lines, exactly where you usually DON’T want to shoot flames)

- easy changes (you can swivel PEX joints around even after crimping them and they remain intact)
- easy pipe routing (PEX pipes can curve around corners and be pulled easily through awkward wall cavities)
- virtually freeze-proof (copper pipe is destroyed 100% of the time if you freeze it while full of water. PEX seems to miraculously survive repeated freeze-thaw cycles even at 0F, according to my own series of tests using my freezer)
- environmentally better (a roll of plastic uses much less energy and oil to produce than mining, melting, and refining an equivalent quantity of copper from solid rock).
- amazingly reliable. With copper pipe joints, you never know if you did a perfect soldering job until you turn on the water supply and check for leaks. With PEX, if you squeezed the clamping tool until it automatically released, you got the joint right. I've done thousands of these PEX joints now, and never had a single drip.

PEX is *so much better than copper in every way*, you should immediately roll your eyes and sing a **circus clown song** at anyone who tells you they still do their plumbing with copper. So let's get started.

Tools of the Trade:
There is a common misconception, even among plumbers, that PEX-related tools are expensive. This is true, if you buy the silly obscure-brand $250 crimping tools that plumbers buy, but I will share with you the secret way to get all the required parts for minimal cost. All you need is:

- One PEX clamp tool, like this one.
- And a bag of 1/2″ clamps (also called crimp rings) like these ones. If you're working with larger pipes, as you might when connecting a water heater or sprinkler system, you can get 3/4″ components as well.
- A roll of the actual pipe itself can be found in any building supply store, but it looks like this.
- Then you'll need something to cleanly cut the pipe, called a tubing cutter.
- Whenever you have to cut off old copper pipe cleanly, you use one of these wheelie deals.

- To connect the old copper pipe to your new PEX pipe, you just push both pipe ends into a Sharkbite coupling.
- And when run new pipe along studs or under floors, you attach it every few feet with these handy dandy talons.
- As you start a project, you'll be using fittings like elbows, tees, and shutoff valves for places you'll eventually connect a faucet or toilet. You can find everything you need in the plumbing section of Lowe's or Home Depot, or if you think in advance you can get the fittings cheaper at Supplyhouse.com (formerly Pexsupply.com) right here.

Congratulations! You are now fully equipped for water supply plumbing and repair, and the tools themselves cost you less than $80!

So let's do a sample project

In the current house I'm remodeling, I decided to cut off the entire copper pipe network, at a point fairly close to where it enters the house through the basement wall. I used a copper pipe cutter (the thing with the little cutting wheels) just like the one I showed you above.

Then I pushed on one side of a sharkbite coupler, and took a length of PEX pipe and pushed that firmly into the other end of the coupler.

Push-on connector fits over both Copper and PEX, making a perfect connection. Gator Grips and Sharkbites are removable, while the less costly alternative shown here is single-use.

Slide in the PEX, and the connection is done.

From this point on, I was able to easily branch out and connect everything in the house into the network using standard PEX fittings.

That was too easy. Show me another project!
Here's a great one – connecting a brand-new shower valve to the supply plumbing.

This used to be a lot of work for old-fashioned plumbers because they had to disassemble the valve in order to avoid melting the sensitive plastic and rubber parts inside. Then they would stick some copper pipe into the openings and heat the whole thing up to a zillion degrees and melt in some solder.

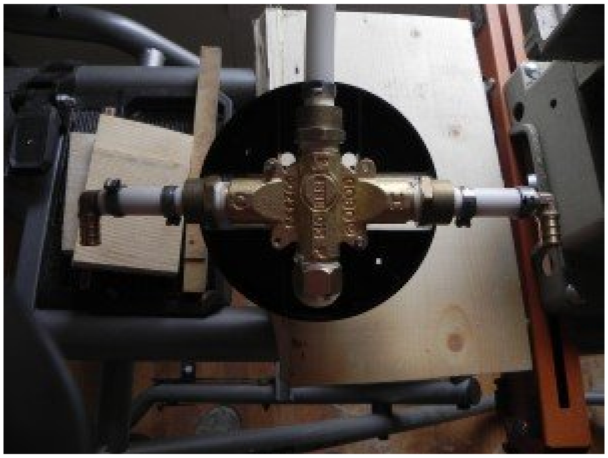
But as modern PEX plumbers, all we have to do is wrench on some 1/2″ female pipe thread adapters to the male connectors provided on virtually every shower valve. (Note that you add about 8 laps of teflon tape first to ensure a watertight connection).

A normal shower valve with three PEX adapters screwed on (left, top, right), and a cap screwed onto the bottom outlet, which we don't need because we are making a shower only with no bathtub spout.

Now we get to use our new clamping tool. Cut a short length of pipe for each side of the shower valve and a longer one to go up to the showerhead, push one length onto each of your nicely tightened adapters, slide on some clamp rings (1/4″ from the end), and clamp them.

This is all it takes to make a permanent joint with the clamp tool.

Repeat this process to connect in a couple of 90 degree elbows, and eventually the two long pipes that go down from shower-handle height down into your wall to connect to the rest of the world.



Elbows are on…

..And throw ‘er into the wall, connecting to hot, cold, and showerhead pipes!

Eventually you'll add some tile backerboard material and the shower will look like this just before you tile it.

It really is that easy, and you can follow these basic techniques and work your way through an entire house to build the connection points for toilets, sinks, tubs, showers, laundry machines, garden hoses, pet grooming centers, bar sinks, sprinkler systems, boilers, solar hot water heaters, radiant floor heat systems, and anything else you can think of.

PEX components also make a great toy for kids. You can sit together and cut lengths of pipe and slide them onto fittings (just skip the clamping stage so you can reuse the parts later), to make animals, water experiments, fountains, and scientific-looking sandbox volcanoes and erosion demonstrations.

You can think of this article as an enthusiastic advertisement to get you excited about the concept and give you an idea of where to get started. If you're going to plumb a major project, you should also grab a library book about plumbing to understand how to make sure your projects end up building-code-compliant. There are also videos on YouTube that teach you how to do almost anything related to home renovations.

Finally, you can check with your city's building department if you have additional questions, and they can help you pull building permits and schedule inspections of your finished work to ensure everything is done in a trouble-free manner. Building inspectors are usually nice, under-appreciated people who love to share their knowledge and help you learn even more, so don't be shy about getting building permits for important projects.

What we just learned is called "supply plumbing". That's the most important and useful skill, but you can also complement the knowledge by learning about "drain plumbing" (the black pipes that start under your sink and send water out to the sewer), and "miscellaneous", which is just the lego-style fiddling you do when you connect a faucet or replace a toilet. Once you can do all of them, you are way ahead of your neighbors, and you may find yourself earning cases of beer or home-cooked meals just for helping them with the simplest of tasks.

Happy Thanksgiving – And Buy Nothing Day! (and Month?)

By Mr. Money Mustache

Fri, 25 Nov 2011 06:19:02 +0000

 MMM-MMM!! I sure hope your Thanksgiving dinner was as delicious as mine. You can see my plate right over there for comparison. Well, to be honest, that was just my *first* of several plates of deliciousness.

Great food, great times with family, and… a trip out to the shopping mall the next day or even in the middle of the night!?

I'll have to admit I only came across the concept of "Black Friday" and the associated shopping tradition fairly recently. So I was able to see it for the bizarre ritual that it is.

For those not steeped in this US tradition, the day after the Thanksgiving holiday is traditionally the busiest shopping day of the year, and people drive to the stores in droves in hopes of buying themselves some things, hopefully at some sort of sale or discount price. The fad has become so extreme that it causes traffic jams, lineups outside of stores at 4:00 AM, and even stampedes and violence as people rush through the store entrance to get the limited-availability specials.

The shopping is partly caused by the approach of “Christmas” (a consumer/shopping event which happens to be named after a major religious holiday), and partly caused by its own existence (people hear that Black Friday is a big shopping day, so they go out and shop, which makes it an even bigger shopping day, which spreads the trend further).

As a reaction to this cultural phenomenon, a smaller movement has sprung up called “Buy Nothing Day”. The idea is that you deliberately stay home on the day after Thanksgiving, and don’t buy anything at all. This obviously works well for me – in fact, I’ve never personally been to ANY store on Black Friday.. because I usually have plenty of food in the house left over from Thanksgiving dinner and thus there is no reason to leave the house to visit a store. If I did happen to actually need something, like a new pair of socks or a frying pan, I would certainly not want to go to the store when everyone else was there, since it would be inefficient to deal with the crowd.

So I just thought we could all celebrate Buy Nothing Day together, and have a Leftover Turkey Sandwich and a cup of tea together today and tomorrow, while we reflect on how crowded the roads and stores must be for our less-fortunate countrymen.

In fact, if you are willing to get really extreme with me, you should consider this wise note that my Dad recently sent out to his four grown kids. Read carefully, for this man is effectively Grandpa Mustache to you:

> Howdy all…
>
> Since for me a simpler Christmas is a grander Christmas, I’m planning to follow this procedure:
>
> No gifts given to adults or teens (for those who feel they simply must give to me, I suggest a small comestible – preferably home-made! Or a donation to a charity).
>
> Grandpa will be giving to children under twelve.

> This helps to avoid stressful shopping and allows folks to focus dollars where really needed.
>
> The best present for me is getting together with you.
>
> Merry (and simple) Christmas!
>
> Dad

Isn’t that great? With just one simple email, a senior member of a family can start a chain-reaction of holiday relaxation, where everyone is relieved of the pressure of buying things for each other just because it happens to be a certain time of the year.

Some of you might love the holiday gift-buying tradition and not be ready to give it up.. but others might be carrying on just because of perceived social or family pressure. And many people act on this pressure even when they are drastically unqualified to be buying expensive things for other people – for example, folks who still have car or credit card or student loan debt that hasn’t been paid off.

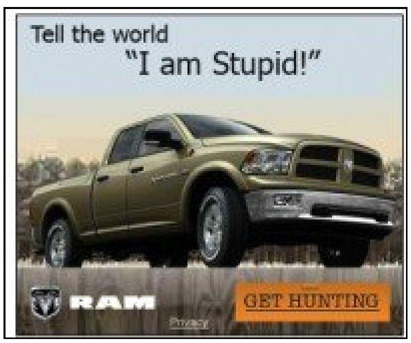
My advice to everyone who is willing to try it is: try sending a Grandpa Money Mustache email of your own out this week. Let everyone off the hook for buying you gifts. You might find, as my Dad did, that everyone rushes back with a chorus of emails of agreement, and that they are happy to just spend time together, completely independent of buying and exchanging “gifts”.

Let’s shut down the entire retail sector for the holiday season. Leave the roads and the parking lots empty, and fill up the sidewalks and the public parks and the hiking paths instead. Make your holiday decorations out of branches from your own trees and gardens, and make a point of donating whatever time and money you can spare to help someone else. I can guarantee most people won’t follow this advice, but those of us who do will have the best holiday season, all without the help of any markdowns or discounts or sales!

New Cars and Auto Financing: Stupid, or Sensible?

By Mr. Money Mustache

Mon, 28 Nov 2011 13:01:19 +0000



When you hear people talking about their cars, you usually hear ridiculous terms like "dealer", "interest rate", and "payment".

Mr. Money Mustache has already laid down the law on this issue in the past: You should never even spend *all* your money on a car, let alone *more than all your money*. So why does everyone still get car loans? Pure blissful consumer ignorance? Or are there some subtle details I am missing out on? Let's examine further.

The first barrier to overcome is affordability. If you don't even have the money invested somewhere to allow you to pay for a car in cash, you are obviously far too poor to buy that car. Wake up! If you couldn't save the money by this point, what do you think it will do to your finances to hang a giant boat anchor of mandatory principal and interest and insurance payments around your neck? You are in a bad place right now – you obviously don't need to make it worse for yourself!

But let's say that you DO have enough money for a car. Five grand, ten, twenty, even thirty grand. It's just sitting in your bank account, and that's not even counting the money you have 'stashed away in your 401(k). You plan to invest this cash soon so you can earn dividends and capital gains, and the dealer down the street is offering auto financing at only 1.9%. Borrow the money cheap, and leave it invested at a higher rate. That's a no-brainer, right?

In most cases, this is wrong again, and that's what we're going to examine in this article.

The key to optimizing your automotive expenses is in thinking about *total cost per year* and *cost per mile* rather than *cash outlay per month*. Doing this will affect both your vehicle selection and your driving habits.

The most important factor is of course reducing your driving outright. That means living close to work, using your feet or bike for destinations within a few miles of your house, and treating your car as a special luxury leisure tool you get to have because you are rich, rather than a daily appliance you depend on. With priorities like these, suddenly the idea of a 2-car household starts to seem ridiculous, since the chances of both you and your spouse simultaneously needing to do something as exotic as driving, with no chance of sharing or adjusting your schedule to accommodate it, is hard to imagine.

At this point, you'll have a car that gets driven less than 10,000 miles annually, and ideally less than 5,000. At the 5k level, it would take you 40 years to use up a reliable car's 200,000 mile lifespan, meaning a single new car would be good for most of your adult lifetime.

It may sound nice to have a car that is still in nearly-new condition after 20 years, but it is actually very inefficient, because of a concept I like to call **automotive inventory.**

Businesses figured out long ago that carrying excessive inventory is bad for their financial health. Products go stale or become obsolete on the shelves, and money is tied up in something that does them no good until it is sold to a customer. If the business carries any debt, the inventory also shows up as part of this outstanding debt and sucks out money in the form of interest costs too. So the ideal amount of inventory is just enough to meet their customers' needs and no more.

Similarly, owning a big *automotive* inventory is bad for **your** financial health. Your new car slowly degrades over time (especially if you store it outside exposed to the weather), and every mile of inventory that you haven't used yet costs you money in the form of foregone investment returns you could have gotten instead of buying such a new car, as well as higher insurance premiums and ownership taxes.

When you buy a brand new car, you're buying up to 200,000 miles of automotive inventory. Even if you are one of the extremists who drives 15,000 miles per year, that is still over 13 years of inventory – meaning that although you are paying for all of those future miles when you buy the car and paying additional carrying costs for them constantly for the 13 years of ownership, you don't get to actually *use up* those last miles until the year 2024.

So let's imagine two 15,000-mile-per-year drivers:

Consumer Carl buys a new 2012 Toyota Corolla S with a 5-speed manual transmission, for $20,000 including taxes and fees and registration. This is one of the best new-car values on the market when measured on a cost-per-mile basis when you factor in its long term reliability and fuel efficiency. He drives it for 13 years, traveling 200,000 trouble-free miles.

After 13.3 years, tying up that $20 grand in a car cost Carl about $38,269, compared to putting the money into paying off part of a 5% mortgage or making another investment that pays a 5% annual return.

Mustache Mary buys a 2006 Toyota Corolla with 90,000 miles on it for $9,000 including taxes. She can only get 110,000 miles out of this car which takes 7.3 years to use up. At that point, she buys a second used Corolla to cover the remaining 90k miles. To make our numbers clean, let's say she buys a slightly older one such that it only has 90,000 miles of life remaining. This costs her $7,500.

She has to go without that $9000 for the entire 13.3 years, which could have earned her $17,221 if she had used it to pay off her mortgage.
Then she spends an additional $7,500 which is missing for the final 6 years at a cost of $10,050.

So at the end of 13 years, Consumer Carl spent $38,269 on Corolla ownership, while Mustache Mary spent $27,271. She saves about $11,000 even while doing the same amount of driving, and she will *repeat* that windfall every 13 years or so by continuing this strategy.

Even while driving a nearly-equivalent car for exactly equivalent mileage, Mary saves 30% on the cost of driving simply by buying her Corollas used instead of new.

“But Wait”, the complainers will say. “You forgot to factor in the increased maintenance costs of the older car!”.

No, I didn’t – because on average these will be cancelled out by the hidden costs of owning the newer car. Collision and comprehensive insurance coverage is extremely expensive on new cars – often $500 or more per year. This annual amount alone is more than enough to nurse a Corolla from 100k to 200k miles. Plus there are often annual registration fees on cars that are higher for new cars than for old ones – the difference is several hundred *per year* in my own area. These provide another financial boost for the driver of the older car as well.

Make no mistake about it – if you have a good reliable type of old fuel-efficient car, it will *always* be cheaper to maintain and repair it as necessary, compared to buying a brand new car. If you have found yourself hit with frequent $2,000 repair bills for your own older cars in the past, you are either very unlucky, very hard on your cars, or have been choosing unreliable vehicles. Reliable cars really do go 200,000 miles or more with just routine scheduled maintenance, and seeking out this type of car for yourself in the future will be part of what makes you a true Mustachian. (Sorry, no more Jeeps, Jaguars, or Audis – the most reliable brands are Scion, Lexus, Acura, Nissan, Mazda, Honda, and Toyota).

There may be situations where upgrading from a very old used car, to a somewhat newer car, are cost-effective, but the brand new car always loses.

The most exciting part of all of the calculations above are that I designed them to show the *worst case* savings.

I picked the Corolla because it is one of the slowest depreciating cars on the market. When you buy a 2006 Corolla with half of its miles used up, you still pay about half of the price of a new one. With most cars, the depreciation is exponential rather than linear, meaning that the first fifty thousand miles are the most expensive ones of all. In other words, you will get an even better deal if you pick a car that is reliable but less well known, such as the Pontiac Vibe (actually an exact twin of the Toyota Matrix, both made on the same assembly line), or any of the other cars rated as “recommended” by Consumer Reports in their used car guide.

And my example featured insane people who drive 15,000 miles per year – over 1.5 hours per day, every day of the year at the national average traffic speed. The lower your annual driving, the more powerful the inventory effect is, and the more you will save by buying an older car.

Even worse, most cars cost much more than the Corolla, so there is more money at stake. I just looked it up and found that the average price of a new car sold in the United States these days is about $28,000. Holy Crap that is a lot of money to spend on getting yourself around.

It’s a bit of a balancing act, because in theory you could get the lowest driving cost by driving around in a *very* old car. A 1991 Honda Civic that you picked up from a bearded musician for $500, or even a 1984 Nissan Pickup like the one I used as a construction vehicle from 2005-2010. But it takes additional skill and patience to keep vehicles like those running. If you do depend on a car for daily driving, or you’re a single person living in Miami and hoping not to scare off too many potential mates, or you need to carry clients around and look somewhat normal doing so, even a single breakdown could cause more costly side-effects than the old car is saving you. That’s why I am suggesting that busy professionals play in the 5-15-year-old car range, rather than diving right into the 1990s.

Here’s a guideline for the age of car that meets this balance, based on your annual driving mileage. It assumes that the typical used car has been driven about 15,000 miles per year before you buy it. If you find one with lower miles, it’s often a good deal because the prices tend to drop with year more than with mileage.

Annual Miles Driven	**Ideal Car Year to Purchase**
15000	2006
12000	2004
9000	2003
6000	2001
4000	2000
Under 3000	late 1990s or older

So how does Auto Financing fit into all of this? How do I answer the person who wanted to borrow from the dealer so he could pay 1.9% interest and invest the balance?

The reason you don’t want to do that, is because you don’t want a new car. It’s not until you get into “taxi driver” levels of annual mileage that the inventory effect of a car’s cost becomes small enough to ignore.

The second reason you don’t want to do that, if you have limited willpower, is that it might entice you to buy a more expensive car than you would have otherwise bought in cash.

I find it very interesting that even at the very bottom end of the automotive market (find the drop-down box to sort by Price-MSRP low to high) in the US (Hyundai Accent, Kia Rrio, Nissan Versa, Toyota Yaris), you already have great fuel-efficient cars with more than 110 horsepower that can easily carry 5 passengers at 100+ MPH, ranging from $10,000-$13,000. In a rational environment, this should be the middle to upper range of the car market – very few people need more than this. In other words, well over 90% of the car market is purely irrational overkill – people buying unnecesarily fancy machines that they can’t afford.

Surely the presence of auto financing is a big part of why this has happened. You just don't need to get mixed up in that world of stupidity.

If you really want a car and you can afford it, get one. But do it in a way that causes the minimum possible damage to our goal here, which is of course getting ourselves rich and free.

An $800 Gift From Me to You

By Mr. Money Mustache

Wed, 30 Nov 2011 12:43:52 +0000

 article about cutting your home heating costs. The discussion that followed in the comments section was full of more great information, and it even led to me making a small change in my own house that should work out to surprisingly large savings. This rather simple trick was: **Changing my master bathroom showerhead from a 2.5 gallon-per-minute model to a 1.5 GPM one.**

Now, you'd think that as a house builder who writes a frugality and personal finance blog on the side, I would already know the full story about water-saving showerheads. I thought I did too, but I was wrong! And because I didn't know this secret, I'm going to assume that there's a good percentage of you out there who don't know it either. So here is the scoop:

In recent decades, the US Environmental Protection Agency has been tightening up the rules on how efficient household appliances and fixtures must be in order to be sold in stores. Various regulation-haters have complained at every step, but regulations of this type actually bring people more freedom – freedom from their own stupidity! Nobody knows or cares how much energy they are using, they just live their lives and pay the utility bills. If you force the manufacturers to offer better products, the people buy them and unwittingly save themselves a shitload of money, all while helping the planet. It's a win/win situation.

Here are some examples: In the olden days, toilets required as much as 3.5 or even 5 gallons of water for each flush. Simple re-engineering of toilets has brought this down to 1.6 GPF and more recently 1.28. These new toilets still work just fine, and don't cost noticeably more, but each one ends up saving the equivalent of a *full backyard swimming pool* of precious drinking water every two years.

And more significantly, showerheads have also been re-engineered to use less water and heat energy. Before 1992, showerheads could dump out 4-8 gallons per minute. In the 1990s, the US standard became 2.5 GPM. This is when I started building things, and I have always felt good and virtuous about installing and using 2.5GPM showerheads.

But someone recently informed me that there are 1.5GPM and even 1.25GPM models that are carefully designed to be *just as nice* as a standard 2.5'er.

Ten bucks or less for massive savings.

For example, here's a 1.5 gallon showerhead on Amazon that has over 150 reviews averaging almost 5 stars = for under ten bucks.

"Could this really be?", I wondered. "I work hard sometimes, and I get coated with sweat, concrete, sawdust, and blood. And I'm a wealthy man who can afford a nice shower. As creature comforts go, it's a pretty cheap one, so I will not compromise on a good hot shower with plenty of pressure and cleaning action".

But at the same time, I did some calculations to see what kind of savings were at stake:

Mr. Money Mustache: 3 showers per week on average, duration of 5 minutes, temperature 107 degrees F.
Mrs. Money Mustache: 4 showers per week, duration 10 minutes, temperature 107 degrees F.
Junior 'Stash: still taking about 2 baths/week, hopefully will graduate to showers one of these years.

Total shower duration per year: 55 minutes per week x 52 weeks = 2860 minutes per year.

How much does a shower cost per minute?

The 2.5 gallons of water I use per minute cost about 1.25 cents according to my utility bill (0.5 cents per gallon).

These 2.5 gallons of water weigh 20.5 pounds. This water enters an average house at about 50 degrees Fahrenheit and must be heated by an additional 57 degrees.

Since we learned earlier that it takes one BTU to heat 1 pound of water by 1 degree, it means the shower is consuming 57 x 20.5 = **1171 BTU of heat per minute.** After accounting for the losses in a standard natural gas water heater, you get about 58,000 BTU of water heating for each dollar you spend on natural gas… so…

A hot shower with a standard showerhead costs about 3.25 cents per minute.
With an electric water heater and 12c/kwh electricity, this cost would be about 5.3 cents per minute.

So if you've ever wondered about the cost for a 10 minute shower, now you know: it is between 32 and 53 cents.

Now how much can the Money Mustache family save each year by going from a 2.5GPM showerhead to a 1.5GPM one?

At 2860 minutes per year, we were spending $92.95 per year on showers (!) By dropping from 2.5GPM to 1.5GPM. we save 40%, which is $37.18 per year.

Wowee. Almost $40 per year from a $10 device is a much bigger return on investment than I'll get anywhere else. And it's over 5% of my annual spending on natural gas. So it's a worthwhile savings. But is it going to hurt my tradition of enjoying Hearty Manly Showers where the water runs black from the extreme filth I am scrubbing off?

like this one*. The people seemed to say that their showers were just fine, and many couldn't even notice the difference when dropping from 2.5GPM. Good enough for me. I picked one up for $10 bucks, and screwed it on.

It is great! I too can hardly notice the difference, my showers still feel great, and the Mrs. actually likes the new showerhead *better* than the fancy-looking one that came with the new valve system I installed when I built our new master shower last year. So it's a hit.

A savings of $40 per year goes straight to your bottom line – flowing into your 'Stash and eventually becoming part of your retirement income through reduced living expenses. To generate this much income forever, inflation-adjusted using a 5% withdrawal rate, you would need to leave $800 permanently invested.

So just by sharing this little secret with you, I have made you $800 richer, just as the readers of the earlier article made me that much richer by sharing the same trick. Happy Holidays!

** I was planning to get the Amazon/Niagara one after reading the reviews, but I happened to be in Home Depot and saw a bin of Pfister ones at the same price. So I picked one up, figuring I could always return it if the performance didn't match the better one I read about. But as noted, this one works great too and earns Lady approval, which is the key factor.*

Mr. Money Mustache gets Passed the Early Retirement Torch

By Mr. Money Mustache

Fri, 02 Dec 2011 05:34:35 +0000

 nice textbook about the subject as well.

http://earlyretirementextreme.com/so-long-and-thanks-for-all-the-fish.html

In the post, he said he wanted to pass the torch to Mr. Money Mustache. I found it very touching, because he has told me in the past that the main reason he kept the ERE blog going so long is to support people who were benefiting from his help. The common feeling is that financial independence through frugality is not a very well supported thing in our society yet. There's lots of information out there on making and investing money, and lots of completely different websites on frugality and simple living. But apparently not that many people write about combining the two interests and then running them both full-tilt to achieve an early retirement.

But I can't claim to be a replacement for Early Retirement Extreme. I'm a simpler and more easily fulfilled man, and so I tend to write more about specific lifestyle issues and their effect on one's 'Stash, as opposed to broad social trends. I also tend to offend many more people (as you'll see in the comments to his farewell letter), and I admit that while I don't *mean* to offend them, I do get some enjoyment from reading angry comments when

I come across them. Controversy is good, since the goal here is obviously to shake things up.

Really, I'm just a guy sitting on the couch typing things into a computer. But because of YOU, it is a whole world of fun. So thanks very much to all. And I dedicate this video to Jacob, just because I *always* sing this song whenever the the phrase "pass the torch" comes up in conversation:

Muscle Over Motor

By Mr. Money Mustache

Mon, 05 Dec 2011 13:20:40 +0000

 It’s definitely late fall here in Colorado, and the trees have dumped most of their leaves onto the ground.

In my neighborhood, this invariably triggers a flurry of lawn contractor activity. A pickup truck pulling a long trailer full of equipment pulls up, a fleet of young guys gets out and each picks up a leafblower, then for the next hour they blow leaves and gasoline fumes back and forth at each other while the surrounding square mile of city becomes a toxic and ear-splitting war zone. Eventually they manage to get a portion of the leaves into plastic bags in their trailer and they motor off.

Just a few days ago, we had an early snowstorm here, which dropped a quick few inches of luxurious fluffy powder onto the newly blown lawns. I was enjoying a casual bike ride through the stuff on my way to the grocery store when I glanced over and noticed a shockingly irrational specter: One of my neighbors was clearing the light powder from his short sidewalk with a **SNOWBLOWER!**

Like 99% of the snowfalls in this region, this was a quantity of snow that could have been easily swept aside with a shovel, or a broom, or even a tiny little bird feather… but this able-bodied gentleman was out there doing his duty with a gas-powered appliance. The stench leaking from the crude 2-stroke engine left a stain in the air that could be smelled from 500 feet away.

Earlier in the week, when the temperature was in the 60s, other neighbors were using gas-powered lawnmowers to slowly mow their lawns while simultaneously sucking up and chopping the autumn leaves into the lawnmower's bag, which they then threw out with their weekly trash.

All of these events led my brilliant engineer's brain to come up with a few new Inventions:

Imagine a leafblower so advanced that it harnesses the power of your abdomen and biceps, while sucking away your stored fat reserves. Yet it operates nearly silently and costs under 15 bucks. With just a simple wooden handle and a few ounces of sturdy bent plastic or metal prongs, it could be lightweight and quite wide, and be able to clear thousands of square feet of densely-packed leaves per hour, leaving you feeling refreshed and healthier and more connected with Nature every time you use it.

Imagine a snowblower so supreme that it works a complementary set of muscles to the leafblower above: your shoulders and your lower back, as well as the hamstrings and portions of the gluteus. It also operates with silky silence, and it ALSO gets 100% of its power from the ultimate renewable resource – your beer belly.

You would assume this futuristic device would cost hundreds of thousands of dollars, right? Wrong! This too is under fifteen bucks.

My next invention is an advanced motorcycle that weighs less than thirty pounds and costs less than three hundred dollars. Yet it has a range of over a hundred miles per day, and you never have to find a power outlet to plug it in, because its power source is – you guessed it – *the cellulite stored in your ass which gets converted into muscles in your legs and calves as a side effect of the transportation!*

I know I am blowing your mind with these inventions, but I actually have working prototypes right in my garden shed and garage.

I also have a lawnmower with a spinning reel of sharp metal blades that gets its power from *me pushing on the handle,* and even a boat (which I am demonstrating for you in the picture below), that is 11 feet long, and able to navigate everything from tranquil lakes to roaring ocean surf waves to car-sized river rapids.. but which deflates to fit in a bike trailer, weighs less than 25 pounds, costs less than $100, and is also powered entirely by muscles.

Yee Haw! Motorboats be damned.

I think you might be noticing a pattern here. And the pattern is of course **Muscle over Motor**.

It's more than just an article. It's a Founding Principle of Mustachianism, because when you embrace it, it adds great fun to your life even while it simultaneously strips away the fat from your physique and your budget. It's one of the most powerful little three-word sentences you can embrace.

Because of the power of Muscle over Motor, you should be deeply suspicious of anything with a motor. A motor represents a shortcut to getting something done. That sounds good on the surface, but you must consider what you are shortcutting.

A motorboat will get you across the lake quickly, but wait a minute, you *like* being on the lake – so why not use your muscles to actually *earn* your trip across it? It takes longer – that is a good thing. You will enjoy the beers on the deck afterwards much more when you really deserve them.

A Hummer will get you up the logging road and across the rocky meadows. But dude, you're sitting in a glorified Lazy-Boy recliner and pushing on a pedal. What kind of wussy way of climbing a mountain is that? Leave the motor vehicles where the pavement ends and put on your hiking boots like a Real Man or Woman (or a pair of old flip-flops if you want to be even more badass like some of my old-school Colorado friends).

If you want more speed than walking and the ability to cross dozens of miles of terrain per day (as well as catching much more air on the descents), try a mountain bike instead of an SUV.

A Harley – of course with its quiet stock mufflers replaced with illegal straight pipes – will get you through some beautiful rocky canyon roads and allow you to ruin the outdoor dining of thousands of people in the hopping downtown Chicago restaurant districts. But a nice lightweight road bike will get you up the same roads and let you hear the birds at the same time, and your resulting muscular physique and healthy glow will get a lot more positive attention in downtown Chicago than the overpriced motorcycle and standard-issue black leather "Independent-minded Renegade Harley® Rider" Halloween costume ever will.

If you need to carry a few bags of cement over to a neighbor's house, try a wheelbarrow or a dolly instead of a pickup truck. If you need to get up to a different level of a building, give me a break, you don't need an elevator or escalator… find the stairs! You work on the 63rd floor? I envy you!

In the gym, the machines with fancy paint jobs and HD displays are to be mocked, because there is already a much more effective yet simpler tool that helps you exercise, namely the chunks of metal with handles on them in the free weights section.. or better yet, in your own garage or basement or living room or friend's house.

Even if you're missing some of your younger physical abilities or you are in a wheelchair, you can still use what you've still got to kick as much ass as possible!

The thing about this philosophy is that it keeps you very busy, which means it keeps you out of financial trouble as well.

If you are following Muscle over Motor, your leisure time is packed with active high-effort outdoor activities which you love. And because of this, you don't even *have time* to take up expensive hobbies like waterskiing behind a powerboat, or jacking up your Jeep so it has higher ground clearance so you can drive it around the trails at Moab, or riding ATVs around to shoot at animals. Sure, these can be fun activities as well, but we all have a finite amount of time and money.

So which activities do we choose: the expensive ones where you sit on your butt and twist a throttle? Or the low-cost ones that also make us healthy and develop our physical skills?

This isn't a perfect rule, because there are exceptions. Motors are still useful when we're trying to get some serious work done. I'm not suggesting that the world's excavator operators climb down out of their cabins and pick up garden shovels, or that carpenters sell their table saws and start cutting 16-foot trim boards with a handsaw. Taxi drivers may or may not want to switch to rickshaws, and accountants should definitely not give up their computers.

But when applied to most of your life, this whole idea of powering your own damned recreational activities (including lawn care) is a great one. It's another form of *Insourcing*, but it applies to everyone, not just homeowners with chores. If you find yourself tempted to use a motor when a muscle will do just as well, you should imagine me hovering behind you and reminding you of the slogan every time you reach for a gas-powered lifestyle accessory.

So MUSCLE ON!

This is email #14 of roughly 35 in the MMM "Just the Classics" boot camp series. You can always find the original versions of any of my posts in [this complete list of all posts](#).

Can you follow me on Twitter?

By Mr. Money Mustache

Tue, 06 Dec 2011 16:18:48 +0000

Hello dear readers. I've decided that to become a real blogger, I need to have more people signed up to the twitter feed. This lets me share smaller things like interesting news stories or daily observations, without the two-hour commitment of typing up a whole article.

As a side benefit, it helps this website get more fully implanted into the Internet itself, leading to an expansion of the insidious spread of Mustachianism through our society, like a delicious new disease.

If you have a Twitter account, would you be willing to click the twitter link below and add me to the list of people you are following?

I promise I will try to only type interesting things into Twitter, and I will never use the abbreviations "OMG, LOL, or ROTFLMAO" or write "ur" when I mean "Your" or "You're".

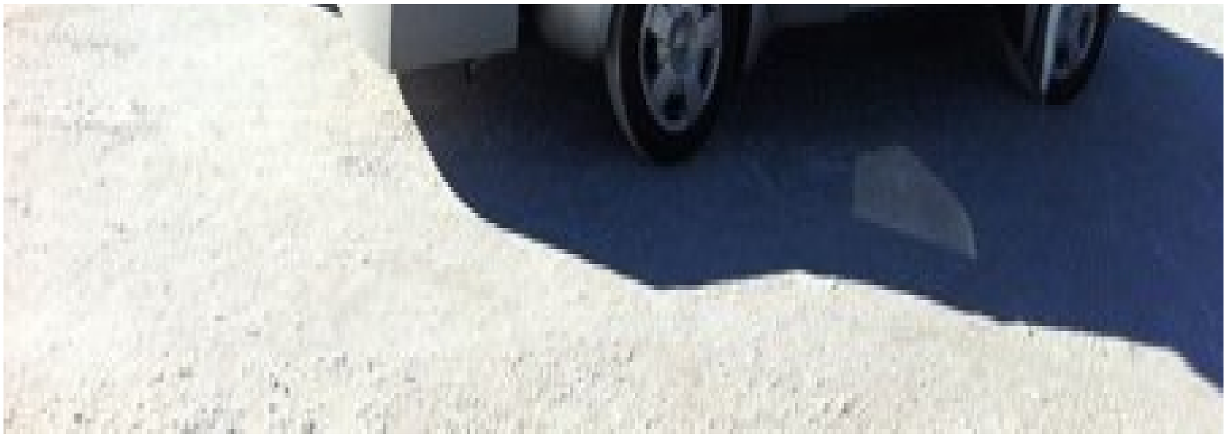
If you like, you can accomplish this by clicking here.

many thanks,
Mr. Money Mustache

Turning a Little Car Into a Big One

By Mr. Money Mustache

Thu, 08 Dec 2011 13:06:55 +0000



Colorado Springs – a favorite first stop
on many of our road trips heading South.

As anyone who has read more than a few MMM articles has learned, the key to becoming rich is living an *efficient* lifestyle.

When it comes to your choice of car, this means making sure you choose one that is optimized for **whatever you will use it for the most**.

While this sounds self-evident, it is actually a rare way to buy a car in the United States. Most people tend to buy the largest and most powerful model they can afford, based on the idea that there are occasional situations where the capacity will be needed ("I haul a boat to the lake every summer, and I need to have enough power for uphill passing even when towing the boat and all my family").

Because of this, the 360 horsepower, Ford F-150 pickup truck (17MPG city) is by far America's best-selling vehicle, more than doubling the sales of the top car on the list, which is the still-rather-large 3200 pound, 178 horsepower Toyota Camry.

Most people do most of their driving alone. So the efficient choice (assuming you even need four wheels) is a very small car. Anything else is inefficient, and inefficiency means poverty (and possible punches in the face).

Luckily, in the US and Canada at least, even the smallest cars are large enough to carry a family of five in relative luxury.

But what about those rare times when you need more space than your small car provides? Like a camping or ski trip? Or a trip across the country where you'll be virtually living out of the car? Should you pre-emptively opt for the Cadillac Escalade or a Chevrolet Tahoe? The Ford Expedition is nice, but even better is the Excursion because it's even bigger. What about the Ford F-350 longbed king-cab with six wheels? It would look even nicer pulling a 35-foot travel trailer full of king beds and big-screen TVs. No, that's too small and makeshift – you need a 44-foot Monaco Dynasty* *pulling* an Excursion as your runabout vehicle when you get to the destination.

Or, if you want to do it Money Mustache Style, all you need is your existing small car, with some handy outboard storage that can be added for roadtrips, but removed for the other 90% of your car use.

As you know, I've been running a Scion xA for the last several years. This car is so great, it should come with a giant silver mustache as its front grille. Despite being one of the smallest cars available in the US (at only 7″ longer than a Mini Cooper), it is a full four-door-plus-hatchback design and easily seats five adults and holds their backpacks too, and can get them around the country at well over 40MPG when driven properly.

This car has already done some fairly impressive roadtrips. Moab, Phoenix, Santa Fe, South Padre Island, the Great Lakes region of Canada and many points in between.

The Scion's biggest trip so far was about one year ago. The trip was planned well in advance, and designed to be over a month long, spanning the states of Colorado, New Mexico, and the near-tropical Gulf Coast of Texas. Our goal was to include some family beach camping, and some boating with the inflatable Sevylor kayak. And we wanted to carry and cook all of our own food, restocking from grocery stores as necessary. All with a child who was four years old at the time, in one of the smallest cars you can buy.

Sound like fun? It was!

The first adjustment I needed to make was adding cruise control to the car. Inexplicably, the Scion xA did not have that feature in 2005, so I found a nice Rostra kit on Amazon for about $200 and installed it – a useful educational experience in itself.

Next, I needed more space for the camping equipment and the boat. At this point, I noticed that there are three ways to turn a little car into a big one.

1: Put Your Cargo on the Roof:

Even if your car did not come with roof rails or racks, you can get great ones that are easy to install from manufacturers like Yakima and Thule. Once you have a basic rack, you can take the simple route and strap a few waterproof duffel bags to it, or for more frequent long-distance trips you can up the ante with aerodynamic hinged **roof boxes**. These work well, and they are often available nearly-new at less than half price from Craigslist.

2: Put your cargo behind the Back Bumper:

Just ignore the fact that this rack is on the back of a big stupid Chevrolet Avalanche (what use is a pickup if you can't even fit your full camping kit in the cargo bed?)

A roof box is fine, but from an engineering perspective it is not ideal to add accessories to the top of a vehicle, because this adds to the aerodynamic drag and thus the fuel consumption. It would be much better to add the cargo to the *back* of the vehicle, so it can ride for free in the slipstream behind the car. If you have a trailer hitch on your car, or are willing to add one, you can then click in many useful accessories to the hitch receiver: bike racks, cargo baskets, and even huge locking boxes that keep your travel gear safe and dry, while keeping your cabin clear for people.

3: Hook up a Trailer:

This is the most powerful option. Perhaps because of liability or profit concerns, car companies will often try to discourage you from thinking about pulling a trailer with a small car, and as a result, people in the US usually buy trucks when they plan to pull one.

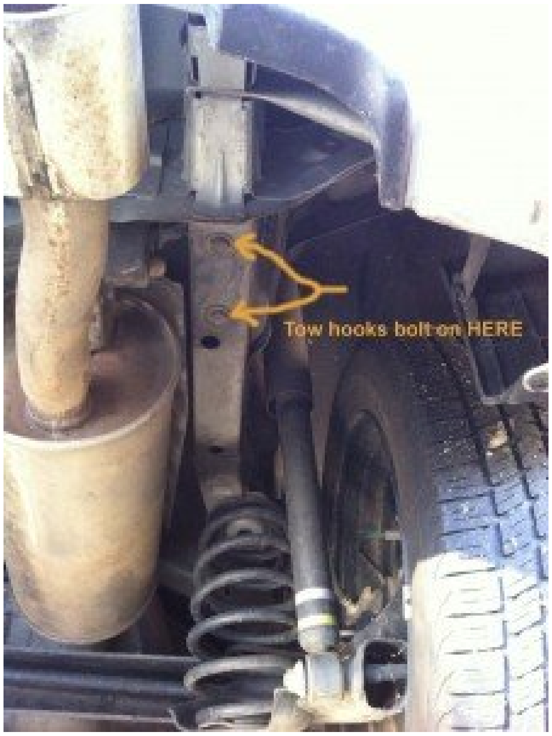
But think about it this way: I have a power output of less than 1/3 of a horsepower, and yet I can easily pull a full-sized refrigerator around on a trailer with one hand. Even my tiny car has a 108 horsepower engine, making it at least 324 times more powerful than me.

Your car can easily pull any reasonably-sized trailer, and you can get a nice low aerodynamic one for road trips, or an open-frame metal one for landscaping and construction materials. You can get a basic 4x8ft trailer for about $320 at Harbor Freight tools and then customize it however you like. Or even a bigger enclosed one that can serve as a rolling workshop or double as a storage unit or shed. Trailers like those are often found on Craigslist, sometimes already stocked with tools from a contractor who is selling his business.

With the advent of trailers, Boom – the entire category of vehicles known as pickup trucks is now obsolete, unless you are a farmer or Bakari Kafele.

I did some shopping around and determined that I could get a new roof rack and roof box for about $300-$500. While that is not chump change, it is still a great savings compared to the cost of buying and operating a larger car, just because you need the cargo space to be larger a few times per year. Roof boxes are truly the easiest way to turn a little car into a big one.

But being Mr. Money Mustache, I decided to take a slightly different approach and invent my own **back box** for the car, custom-fitted to the curve of the back bumper to maximize space and aerodynamics. Since I have no trailer hitch, I needed to find a way to attach it to the car, but when I looked underneath the back, I found the perfect thing – the tow hooks. I wanted a lower mount point anyway, so I welded up a custom metal support frame which bolts exactly into the holes where the car's existing rear tow hooks attach. I was able to weld one long piece of 1×2 rectangular tube steel to each tow hook to create a this frame onto which I could build a box:



Here’s where the tow hooks were bolted on

Here’s the tow hook, welded to a piece of 1×2 rectangular steel.

With a late night of cutting and fiddling and painting, I was pleased to end up with an enormous box (80 gallons of internal volume) that is lightweight but strong enough to hold several hundred pounds.

Both hooks bolted back on along with the steel, ready to build box

And here's the finished box (undergoing a "heavy load" test)

Caution: *If you actually build one of these, be sure to route the car's exhaust under the box and out the back so you don't burn a hole in it. Version one of my box died a melting death, taking a nice cordless drill with it. But by screwing a flexible exhaust pipe onto the existing tailpipe, version two has been trouble-free.*

This box was the star of the one-month roadtrip to the Gulf of Mexico, holding all of our stuff and even gathering several appreciative comments from fellow Mustachian travelers (usually from Wisconsin) who I caught admiring it in parking lots. And the total cost was about $30 worth of wood, metal, and paint (although I used scraps from my construction business so in reality I paid $0). It took about one full day of very fun work to build it.

This is the inside view, holding a tent to show the size – I had to cut some shallow slices in the wood (similar to guitar construction) to get it to bend to fit the car

Here’s the box in action on a road trip: serving up food for a sand-dune cookout in New Mexico.

So before you go “upgrading” from a sedan to an SUV because you find it inconvenient to fit your stroller in the trunk, try thinking it out logically first:

A “coupe” or “sedan” is a useless design because the trunk is low and awkward. So look for a hatchback or a wagon. These are almost universal in Europe, where the people are smarter than us. They are less common here, but luckily still available.

An SUV is just a wagon with a raised suspension, making it inefficient for on-road use. The fact that they have a wagon design is why everyone thinks they are so practical, not realizing that the high ground clearance and big engine are unnecessary warts in the idea.

A small hatchback will do most of what an SUV or minivan does. Then you just need to decide between the roof box, back box, and trailer for those rare times you need an even bigger car.

Just as we expanded the usefulness of our bike by adding a backpack and/or a bike trailer in an earlier article, you now have a small car that can do more than everyone else’s big cars. See you at the campsite!

* If you’re in time-wasting mode right now, you should also check out the interior of that Dynasty :-)

She’s the DJ, I’m the Rapper (1 Million Page Views)

By Mr. Money Mustache

Sat, 10 Dec 2011 07:02:32 +0000

Today was a slightly exciting milestone in the life of this blog, in that it reached the one MILLION page views mark, measured since the day it was born on April 6th, 2011.

Some additional interesting figures: It has been around for nine months (although it feels like many years), and the Google Analytics stats page says there are might be about 25,000 regular readers and 5,000 RSS subscribers. Altogether, about 205,000 unique people have visited the site at one time or another. They made 424,000 visits at an average of 4 minutes each, meaning that on average, 104 hours of reading have been done each day. We’ve written up over 4,300 comments together. Any way you slice it, there are at least a small city worth of Mustachians out there, which I find quite exciting!

Just today, for example, I learned that some guy started a blog called “[Toward Mustachianism](#)“, where he studies up on the concepts here, and applies them to his own high-income/high-spending (but dropping rapidly) lifestyle – and will surely see great results.

On a personal level, I have found this new role as Mr. Money Mustache to be quite a golden life booster. It is so much fun to get a chance to write down all these ideas and rants that have circulated in my head for years.. and have actual people read them and write back to share more. I feel the added challenge of thousands of imaginary eyes watching me when I feel tempted to make any sort of wussypants decision in my daily life. It has brought out many good laughs, and even brought me closer to some friends and family as well as finding some new friends out there around the world who I hope to meet in real life.

I mention all of this mushy stuff because I wanted to use this milestone as an excuse to say THANKS to my wife, Mrs. Money Mustache, for forcing me to start writing this blog. I was content to just occasionally write stuff down in an old Google document whenever it came to mind, with no interest or desire to ever publish it anywhere. But she set up this fancy blog system and reserved my previously-imaginary domain name, and then just left the whole thing sitting up there online, empty, taunting me, daring me to publish some shit. Since then, she has kept improving it and tweaking it, letting me know about mentions we received from other writers, and generally keeping things going.

That part is the key, because from what I've learned, it is unusual for a blog to grow this quickly or even as large as it has. There are lots of technical hurdles involved and hidden side tasks, which I was not badass enough to spend the time to figure out on my own. Without her, I'm just a guy typing some shit into the computer, an activity which doesn't just automatically create a fun community like this. It's much like our family's kickass roadtrip vacations, where she loves planning them out in meticulous detail, at which point I get to just hop into the driver's seat of the fully-packed car, glance down at the already-programmed GPS, and say, "Ok, so where are we headed first!?".

When it comes to poking around on the Internet and figuring out how to get things done, Mrs. Money Mustache is the bomb. That is one smart lady, and when she gets an idea in her head, she works non-stop and implements it and irons out all of the creases until it's perfect. I respect that greatly, because it's the formula for success in most forms of work. It has also been great to have her as an occasional writer and commenter on the blog itself, and hopefully we'll hear from her more often in the future.

Meanwhile, I'm not that great of a blogger, because ever since becoming a parent I tend to spend most of my time away from the computer. While I reassure myself that this is essential to be a REAL Mr. Money Mustache who has an actual life to write about, it does mean that I tend to let a lot of details slip in the blogging world. Story ideas get thought up but then forgotten, emails go unanswered, and more complicated articles requiring research sit around half-written. I apologize to the many dedicated people that write in every week with ideas and questions which do not get the timely attention they might get with a full-time blogger. It makes me feel a bit uneasy, because I don't really like doing a half-assed job at anything. But oh well, at times like this we must take our motivation from the Honey Badger and just do it.

Over time, even small efforts like this can build on themselves and collect into a bigger success, and that's my goal, the reason I will stick around and keep having fun here with you. Hearing every day from people who have sliced out their long car commute or made lifestyle changes that completely improved their lives is an incredibly good feeling. I can't stop, as long as there is good stuff like that going on, and the scale of everybody making changes in their lives is much more than anything I could accomplish by myself. By one calculation, this blog has indirectly wiped out over 1000 person-years of average rich-country consumption already!

And there is SO much more to be said and learned! I noticed there are now 152 articles on this blog (equivalent to the length of a 600-page book!), but looking in my Drafts folder, I see there are MORE than that many unwritten ones waiting for further details or the right time to share them. More of them get added every day, as part of conversations at the kitchen table or out on the town with friends.

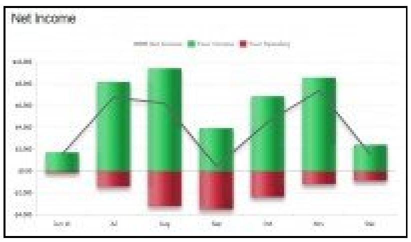
So for the foreseeable future, the Mustache must continue to grow. Thanks for making it happen!

(cover art and title is a takeoff of the 1988 album from oldschool rappers Dj Jazzy Jeff and the Fresh Prince).

Watching your 'Stash… with Mint

By Mr. Money Mustache

Mon, 12 Dec 2011 13:22:14 +0000



Way back in our working and saving days (which peaked between 2000-2005), the Mrs. and I started to become more interested in watching the progress of our early retirement savings project. So every weekend, we'd log into our separate Vanguard accounts and compare notes.

As this simple thrill wore off, we started a spreadsheet called "Net Worth" that automatically tracked the stock holdings in Vanguard and other accounts, as well as any cash in the bank and the value of our primary and rental houses. The spreadsheet grew fancier over time, adding graphs, goals, and historical snapshots.

It became quite exciting when we noticed that the 'stash itself would often produce more income than we did with our work. Dividends and appreciation on stocks and real estate are usually small percentages, but when multiplied across large numbers, they start to surprise you.

We also started to have a look at our spending. We felt pretty frugal overall and thus had never used a budget of any sort. My feeling on the matter was, "Well, since I am spending much less than I earn, what's the point of using a budget – I already know there will be no shortage!" The thing I was missing is that you should still know how much you are spending, because that tells you how much income your investments will need to start providing once you start your early retirement.

And as soon as you start tracking your spending, even the most hardcore frugalist will suddenly gain extra motivation to optimize it. "Hmm.. maybe I don't really NEED to throw this extra bottle of wine into the grocery cart – I'll save a few bucks and go on an alcohol-free health kick this week, and go for a new record in low spending this month". Stuff like that.

When you're shooting for financial independence, I really like the "track your spending" method better than the "budgeting" method. With a budget, you allow yourself certain quantities of waste and try to stay within them. With tracking, your goal is NO waste, so you challenge yourself to cut every category, except eating, to zero. In reality it does not happen, of course, but the mindset of relentlessly thinking over every single purchase and trying to optimize it away is the thing that lets you develop your Frugality Muscle over time.

So the years passed and the lines on the spreadsheet went up, and when they were high enough to pay for expenses with passive income, we quit our jobs and declared ourselves retired. (Of course, we've started little businesses and done smaller side work since then, but that was for reasons other than earning an income to live on).

Since then, we've gone into a slack period in the "thinking about money" department. The income to pay for our modest lifestyle is just automatically *there*. I buy everything with a cash back credit card, which automatically gets paid at the end of each month, from a bank account which automatically gets filled up each month from the rental income and investment returns. A few times per year we might review the portfolio just for fun, but there's really nothing interesting going on in there right now, it's on auto-pilot until I eventually start doing some more real estate deals in the next few years.

So when I started hearing everyone raving about this new financial tracking site called **Mint.com**, the Mrs. and I thought "that's cool for the young Mustachians who are saving hard, or for people with spending problems who have to watch their budgets to avoid going deep into debt.. but it's not for us."*

But the raving continued and the screenshots looked very enticing. So we finally decided to set up an account with them and see what all the hype is about.

Synopsis: Mint is a website which can help you gather *all* of your financial information in one place, then analyze and track it for you very easily with some very beautiful graphs, charts, and reminders.

The service is free for users, as it makes its money by displaying ads for credit cards and other services which would be advantageous to someone with your spending patterns. Some of the affiliated companies pay a large commission to anyone who refers a new customer (something like $20-$100), so Mint surely makes a mint even without charging you a cent.**

As a lifelong technology addict, I can appreciate a really good user interface, and Mint definitely has it. It's fun to use, and it seems to draw you in to set things up in quite an organic and natural way.

Once configured, it can automatically do things like watching your credit card balance for you, and sending you alerts (email, text, whatever) to let you know certain thresholds have been met.

> Mr. Money Mustache! You've spent too much on Beer this week! You must cut out that category for the rest of the month!
>
> …
>
> Mustache! It's Mint again! Do you realize you only have $500 in your bank account, yet your credit card is about to auto-withdraw $600 next week!? Get on it, sucka!"

Mint will also automatically gather the balances from all of your various accounts (investment, bank, credit card, and any loans) and present you with an instantaneous net worth summary.

If you enter your house address, it will automatically estimate the value using Zillow (which you can fine-tune as needed), and balance the home value against the mortgage balance to show your equity in the home.

Mint is also surprisingly good at digesting your credit card statement and sorting out everything you bought into categories. It knows that “The Pumphouse” is actually a restaurant here in Longmont, and that Monsterbrew is beer and wine supplies.

There are many other whiz-bang features including smartphone apps that let you access your data from anywhere, but the real thing you might be starting to notice is this: *Mint has finally provided a way for a normal person to be able to track every bit of his spending, and even keep up with a budget, with virtually zero effort*.

Most of us aren’t going to save all of our receipts and type them into Quicken, and indeed, I only briefly look at my credit card statement at the end of each month, just to make sure every transaction is something I distinctly remember buying. So detailed spending tracking is something that is often started but abandoned due to lack of fun. Therefore, if it’s going to happen, it must be automatic, and that’s why I like Mint. Whether you use a spreadsheet, another software package, or an online service like Mint doesn’t matter, but you should definitely be watching over your ‘stash in one way or another.

What do YOU use? Has anyone found anything equivalent to or better than Mint in their quest? Mint users – how do you like it?

**We were also initially concerned about the security implications of putting all of your financial information in one place. But after learning that Mint only has read-only access to your accounts, and realizing that the real security lies in the underlying banks and credit cards which automatically protect you against fraudulent transactions done to your account, we got over it. It’s also a big operation that was bought by Intuit itself (and subsequently another bank) and now has millions of users, so it has had some battle testing. Overall, I have always been comfortable with internet* *commerce and have never seen any ill effects in over 16 years of participating in it.*

***You'll note that a lot of personal finance blogs do a suspicious number of reviews of rewards credit cards as well, because of this same lucrative commission structure. Not that there's anything wrong with that from a Mustachian perspective – I've been a staunch rewards credit card user for ten years, with many thousands of dollars in cash back and free family travel collected over that time. The field remains competitive with very high signing bonuses and I maintain a list of the best cards on my own rewards card page [here](#)).*

Are You Obsessed with Early Retirement?

By Mr. Money Mustache

Wed, 14 Dec 2011 13:00:48 +0000

I started this early retirement gig almost seven years ago, and for the first six of those, I thought I was the only one out here.

I was definitely alone among my coworkers – When still employed, I discussed the idea occasionally with friends at the office, and the idea was met with universal rejection: “Oh, you’ll never have enough money”.. “I like the idea, but my wife would never go for that kind of lifestyle”, “That may work for some, but I’ve got kids and/or a chronic health condition requiring expensive insurance”.

So when I became Mr. Money Mustache earlier this year, my eyes were opened quite a bit. I was pleased to find this whole community of people, discussing exactly the same things I had wondered about myself. There was even a whole established set of traditions and goals, with concepts like “your number” and acronyms like FI, FIRE, SWR, and YMOYL. In the olden days, if someone wrote "Oh, my friends won't get to FI as quickly as me", I'd assume they were talking about some sort of race to Florida.

Along with this education about the customs of the early retirement community, I also learned about some of its problems. The one I found most intriguing was the fact that many financial independence seekers are obsessed with early retirement, almost desperately counting down the days until they reach the wealth level they have determined they need to retire.

So I thought we could compare notes on the matter – those who have already crossed the threshold and those who are on their way. Is there anything we can tell each other? Any advice from us Wise Old Retired people that might make the journey less arduous? Any tips or traps that occur once you cross the threshold?

To do my own part, I'll give you a list of the things I've noticed about the early retirement lifestyle so far. I'll start with the fun parts, which would probably be labeled as "Financial Independence Porn" by the reader/commenter I like to call Wolf.

Things that were pretty much how I expected them:

- You really do stop using your alarm clock, and adopt a deep belly laugh to be used on people who ask you to be somewhere before 9:00 in the morning. Not that there's anything wrong with getting up early to accomplish something fun or useful, but in general, great productivity becomes something that can wait until after a great breakfast.

- Vacations do happen much more than they used to, even though you probably don't keep track. As a worker, I felt like Mr. Executive for getting four weeks of annual paid vacation. This year, I feel like we haven't traveled much, but adding it up we are at about ten weeks, and are just about to head out for another trip this weekend. Similarly, reading, eating well, exercising properly, and other things you thought you'd do when you have enough time, really do come true.

- The great feelings about not having to commute and deal with office politics or performance reviews or boring work really do stick around. I thought I loved my job at the time, but after quitting I didn't miss it for a day, and I still frequently think about things like moron-laden conference calls and think, "WHEW! I am GLAD I do not have to do that shit any more.

Things that were Not as I expected they would be:

- You'll still do work – LOTS of work, in very unpredictable areas:
  As a person who is motivated enough to break the mold to become wealthy and leave a cushy job very early, AND an MMM reader to boot, you have a naturally curious mind. You like to read, and you are good at getting things done. When you quit your job, you're not going to just idly sit back and consume for the rest of your life. You might take a few months off, but at some point you will need to produce something again. It might be art or music or writing, or working with people in some way, but I'd be quite surprised to hear of a self-made early retiree that stops doing anything at all. The thing about doing things like this, however, is that it is often labeled "work", and you end up getting paid for some of it – like it or not. Because this happens so frequently, many early retirees (myself and the Artist Formerly Known As Mr. Early Retirement Extreme included) find that they don't use their retirement savings nearly as much as they expected. In fact, they end up contributing to them more over time rather than drawing on them.

- Work and Activity level varies greatly from month to month:
  Our ancient ancestors experienced lives of great variation: enormous hunts, periods of discovery and invention, and death-defying migrations.. mixed in with times of great feasting and laziness and of course plenty of famine. In the modern working environment, things are very different because everything is modeled on an industrial production system with smoothly flowing inputs and outputs. I believe this is a somewhat unnatural role for humans, especially at the ridiculous level of 40 hours per week. You can sometimes approximate the restful times by slacking off at work. But on a salary this can be

stressful because deep inside you know you are doing less than your best and perhaps lying about your productivity or cheating yourself out of a potential raise.In retirement, there are times where a project has you up all night, or where you work even harder than a whipped office worker on one of your projects. But there are other times when you have very little going on, and you accomplish much less. It's much like an expanded version of the weekends of a non-retired person. These lazy times are the most dangerous, because if you aren't challenged, you'll start to feel tired and dissatisfied with yourself, which will make you not feel like starting anything challenging, which can become a downward spiral that ends with you sitting endlessly at a computer playing video games, sporting pale skin and skinny arms and a growing set of love handles and man boobs*. How do you handle your leisure time right now?

- You still end up being "just a little bit too busy" much of the time: There's always something better that you should be doing with your time, and no matter how hard you try to work at things on your to-do list, you will still find that you suck. Because of this, you will sometimes find yourself turning down social events or vacation opportunities, or missing out on things that you wanted to get done, because you don't feel you have time to do them. Time management is still a challenge, even when you have more time to work with because your job is gone.

- You don't have to retire to start having a good life:
For every corporate worker who hates his job, there is a SWAMI like the MMM reader named Poorplayer who often offers wise sermons in the comments of this blog. If you had a job that you enjoyed as much as he loves being a professor, or as much as I love building things, you'd never need to quit it. So one option you have is to switch jobs immediately – start searching, send out resumes and make calls and use social networking, and be surprised at how much power you already have over your own situation. Even if you're totally convinced that sticking it out in your $120,000 office job for two more years is worth it because it gets you independent so much earlier, you can still start making other changes. Try to go part-time or work from home.

Get a new position in the same company. Write a list of everything you'll do when you retire – and then start doing some of those things right away instead.

- The Biggest part of Financial Independence is not the Size of your 'Stash – it's the size of your Frugality Muscle:
  The more expensive your lifestyle is, the longer you have to work to build up an enormous investment account. Compounding this effect, this usually means you have an addiction to big spending and may be a bit of a fearful wuss about ever having to spend less. People with this fear obsess endlessly over the "safe withdrawal rate", and select one that guarantees that regardless of the timing of future stock market returns or recessions/depressions, they will never have to decrease their spending and in fact will always raise their spending along with headline inflation numbers each year.

- I suggest you take the opposite approach: acknowledge that you are in full control of your material desires and your spending, and that you can adjust to whatever life throws your way. If the price of oil skyrockets, you'll adjust your life to buy fewer oil-intensive products. If the boom years of the late 1990s return, you'll quietly set aside the gains for future use. If someone important to you needs your help, you might cheerfully decide to cut your spending in half for several years until you're done helping them. Changes like these are simply another form of challenge, and challenge is something that you thrive on, rather than cringe away from, due to the earlier point about the man boobs.

- On a deeper level, Mrs. Money Mustache and I both found that we discovered new things about life from the very process of consuming less – things that we never would have learned if we had maintained the high incomes and spending rate of our peers.

To bring it all back to a single strand of Mustache: I believe that the best cure for Early Retirement Obsession is to start acting more like a retired person *right now*. The further you can push your boundaries out of the current comfort (or discomfort) zone, and into the life you envision for yourself as a retired person, the more you'll start changing into the futuristic person you want to be. And share your thoughts and questions with all of us as you go along.

* This is obviously just the male side of it.. perhaps a female Mustachian can comment on the Lady equivalent of what happens when you get lazy and stop accomplishing anything.

Mustache Family on the Move Next Week

By Mr. Money Mustache

Fri, 16 Dec 2011 13:00:20 +0000

 Hooray, it’s time for another one of our roadtrips. The schools will be throwing out all the kids for the holidays, so we figured we’d take our own son out for another real-world geography lesson for the next ten days or so.

We’ll be leaving on Saturday and driving South to Santa Fe, New Mexico for a couple of days, then moving further Southwest to the Phoenix, Arizona area for some hiking, exploring, warm weather, and other neat things that the city has to offer. Not to mention swimming and hottubbing and luxury-resort-hotel-squatting.

You see, various Travelocity credit card rewards points and discounts happened to align perfectly directly under the watchful eye of Mrs. Money Mustache, so we ended up booking a week in this very opulent resort in Scottsdale for virtually no cash out of the pocket. It was an offer we couldn’t refuse, since all of us love visiting the warm deserts in the winter anyway. To complement the frugal nature of this little vacation, we’ll probably take the little car instead of the van, saving a good chunk of fuel over the 1800 mile round trip.

If you happen to live in the Santa Fe or Phoenix/Scottsdale areas and might want to get together, drop me some words! It would be fun to meet some locals and get the inside scoop on these nice cities. We could arrange a bike ride, or a hike, or a feast or beer drinking event depending on your style.

Blog activity will of course be unpredictable during this time. But there are a few ideas moving along for stories that need to be written up:

- We're getting really close to completing the "foreclosure project" renovation, and there were lots of neat experiences that need to be described there. Fixing up a very old house is always a real can of worms – a mixture of neat opportunities and annoying inconveniences. But right now it is time to whip up a nice marketing page about the property to be posted on Craigslist for rental, since we hope to find a tenant sometime in January.

- I just finished reading a book on investing called, "The Intelligent Asset Allocator" by William Bernstein. I also have a newer book he wrote called, "The Four Pillars of Investing" which I'll bring to read on the trip. Why all the stock market books? Because I might be selling my current overly-pricey rental house within the next year or so, and splitting the proceeds between smaller rental houses or some sort of multi-unit, combined with putting much more back into stocks and other financial instruments – with an eye towards things like dividend income and stable performance rather than just capital gains. I want as much knowledge on these options as possible before taking the plunge. (*Hey Dividend Mantra – if you are reading this would you be interested in writing a guest posting for us on the fundamentals of dividend investing?)*

- Also on the book tip, I'm writing up a "Reading List" page for this blog where we can start keeping track of good books. It will start with just the books I've read recently that seemed worthwhile including the ones already reviewed, plus the books that readers have recommended strongly to me which I plan to read in the near future. Then we can expand it from there. The main idea is to have an easy link at the top of the website that should allow the newer readers to catch up on everything we've been learning for the last year.

That’s it for now – have a great weekend!

Money Mustache vs. Tourist Trap

By Mr. Money Mustache

Tue, 20 Dec 2011 19:35:01 +0000

So the triple M family just spent a couple of nights in Santa Fe on our way here to Phoenix. I've been to Santa Fe a few times now, and it's quite a pretty city. Nestled in a high desert valley surrounded by tall mountains, it's over 400 years old, with the randomly arranged little streets and neat historic buildings to show for it. Even the newest buildings are still made in Adobe style with rounded corners and brown stucco exteriors. So when viewed from a hilltop, the entire city looks like an ancient settlement, despite the fact that it's right in the middle of the United States.

While the place is physically beautiful, there has always been something just mildly unpleasant about spending time in the central historic district of that city. This year is the first time I've visited the place as Mr. Money Mustache, and my new superpowers allowed me to put my finger on the problem: *it's a tourist trap*.

What exactly is the definition of a tourist trap, you might ask? I would define it as any location that makes most of its income from selling things to visiting tourists, as opposed to a valid local economy.

This sounds harmless enough, since we're all free to buy, or not buy, whatever we like. And it works well for standard tourists, since a large part of their idea of a vacation is going “shopping”. When they go to a new place, new products are available – in Hawaii there are unique tropical-themed trinkets, and in New Mexico there are turquoise pieces of rock carved into jewelry and even fabric that mimics traditional Native American patterns. Santa Fe has evolved into an upscale tourist trap where dozens of fancy art galleries can open up next to each other and sell art very profitably even in the high-rent district.

The stylish polished copper logos and crisp halogen lights of these galleries are pleasant to walk past on your way to the central square where the big old trees are beautifully lit up for the holiday season. But the experience is compromised by the fact that every single street of central Santa Fe is absolutely jammed with tourists motoring around pointlessly in their expensive cars. The entire area is very compact and everything is within a five minute walk, yet all around you are fluffy-haired ladies with oversized sunglasses and fur collars, perched on the wide tan leather seats of Escalades, X5s and Range Rovers, bumbling down the crowded narrow streets while the pedestrians squeeze past each other on poorly maintained three-foot-wide sidewalks. There’s a beautiful hill right next to downtown with a walking trail all the way to the top, but the trail is almost vacant even while the streets directly below are jammed with the idling SUVs.

All of this represents a deep conflict of interest to Mustachian Travelers like ourselves. You and I like to travel the world as a way of learning more about the different cultures and geographies. Travel is also a good way to teach your children about life outside of your own city, and even a way to take a break from winter and do some swimming and frolicking out in the sun.

But just because you are leaving your home town doesn’t mean you suddenly want to transform into a mouth-foaming consumer who derives enjoyment solely from making purchases. In fact, you probably want to continue your naturally efficient and healthy lifestyle regardless of where you are. This becomes even more important as an early retiree, when you have the option of spending much more than two to four weeks per year on vacation.

So when the tourist trap sticks out its ugly candy tongue and tries to lure you in so it can bite you, you simply need to recognize the signs and avoid them. I've developed a few tricks of my own over the years, and I am happy to present a few of them in this handy dandy list:

Mr. Money Mustache's Tips and Tricks for Fulfilling Family Travel:

Food: Wherever you go, you'll still be eating every day. At home, you have carefully optimized your eating routine to achieve maximum health and enjoyment at the minimum cost. So why not replicate this as closely as possible even when you're on the road? When traveling by road, I always throw two large food carriers into the car: large self-chilling (12 volt) cooler for cold stuff, and a zippered-top fabric bag for everything else. Then I pack things like nuts, fruit, cheese, peanut butter, cucumbers, carrots, eggs, milk, cereal, and good leftovers from recent home cooking. Along with this I need a knife, fork, spoon, a few beers and a bottle of wine, and an opener for both. Now the MMM family is a rolling party – we can eat while we're driving, or bust out an impromptu picnic on any mountainside, and sit back with a nice alcoholic beverage at the end of a long day.. with no need to ever search for McDonalds or Subway fast food stops for less healthy and more expensive fare.

If we're not camping, we always choose hotels with an in-room kitchen. But in a pinch, the 12-volt cooler mentioned above can keep the food fresh in any hotel room, and you can add a camp stove for cooking up nice meals anywhere. And there is always a grocery store nearby. For airplane-based travel, you won't be bringing as much stuff, but you can still find good natural food when you get there at the nearest grocery store, just as the locals do at whatever location you are visiting.

The most recent example of using the power of Mustachianism to eat like the locals?

Mr. Money Mustache
Eats for Free

I was walking through the lobby of the Santa Fe hotel, and a bunch of Texas business people were finishing a catered company meeting in one of the opulent meeting rooms off to the side. "A guy came out and said to me, "Hey! Y'all like pizza? We ordered too much and don't want to let it go to waste".

I was skeptical at first, expecting a big soggy Domino's cheese and pepperoni pizza. But I decided to check out what he had to offer, and it turned out to be an enormous, unopened, very fancy vegetable pizza from a trendy local restaurant. I graciously accepted the offer and packed it into my fridge, and I've been eating for free ever since.

Amazingly enough, this good luck was compounded with the addition of another food group when we arrived in Phoenix. We were outside horsing around on the kids' play structure, and I noticed an area of orange trees that the hotel had grown as part of its decorative landscaping. They were drooping with delicious ripe oranges, some of which had even fallen to the ground and been left to rot. With no competition for the free food, I was able to pick the very best oranges from the trees.. and we'll all be enjoying them every day for the rest of this trip! Delicious, and educational too.

Destinations: The world has its popular vacation destinations (which are often the crowded and expensive tourist traps), and it has its beautiful places to visit. But these two things are often completely uncorrelated. Your job is to find the beautiful spots that are not overrun with people. If you see a long line of bumbling 45-foot RVs winding along a road, or slick corporate logos selling timeshare properties, or photographers who take a picture of you and then try to get you to buy it (holy shit that is annoying), you are in the wrong spot. If you see plants and animals and perhaps the odd person going about their daily life in a natural manner that has nothing to do with your presence, then you have probably found a good place to enjoy a vacation.

Activities: The most satisfying and memorable things to do are generally the ones that take the most effort from you. It may seem convenient to ride a cog railway or a helicopter to the bottom of the canyon so you can get out at the bottom, buy a picture of yourself, and eat a giant helping of cotton candy on the way back up. But it is even more fun to pack a lunch and a few bottles of water, figure out how to get down yourself on the walking trail, swim around in the cold river at the bottom, and then make the 3,000 foot climb back up in the hot afternoon sun. Then you get to marvel at your tired feet and dusty but well-exercised calves when you kick off the shoes at the end of the long day and crack into the cold beer from your cooler. While the other people in your travel group pay for a 4×4 tour around Cozumel's jewelry shopping district, you might prefer to go for a walk through the streets where the people actually live and see if you can join a soccer game with some of the little kids out in the street.

This philosophy of travel would seem shocking to the standard Wealthy American or European traveler, and it does not fit in at all with the examples of expensive restaurants and white-suited valet parking attendants at the gatehouse of prestigious golf courses I sometimes walk past while on vacation. But I can guarantee it will allow you to have more fun than the big spenders are having, even while you spend about 90% less than they spend per week of vacation. You'll be able to maintain a much healthier lifestyle, and a much bushier Money Mustache than they could even dream of attaining. Happy travels!

-

Guest Posting from Dividend Mantra : What is Dividend Growth Investing?

By Mr. Money Mustache

Thu, 22 Dec 2011 13:21:29 +0000

 Hello everyone. MMM here.

Over the next few weeks, we shall dive into the exciting field of Dividends – the magical stream of free money that companies pay you just for owning their stocks.

In simpler times (i.e., those before 1960), this stream of dividends was the primary reason anyone would even consider owning something as risky as stocks. In the most recent half century, however, stock investing has become more popular and a mania has sprung up around it. This has driven up share prices when measured against the underlying earnings of the companies, and it has spawned a whole legion of market timing and momentum-based trading that attempts to predict the immediate future of stock prices based on recent fluctuations in those same prices.

The more I read about investing, the more I am convinced that buying boring but successful old companies with high earnings, high dividends, and low share prices (exactly what Warren Buffett has done for decades to become the richest investor in the world), is the best way to be a successful investor. Buying index funds indirectly accomplishes this, since there are plenty of boring old companies mixed into the S&P500 index, but for a purer and more advanced form of seeking out higher income, dividend-specific investment is a field to look into.

Academic studies of stock market performance strongly suggest that if there is any way to beat the returns of the overall stock market on a risk-adjusted basis, it is by buying stocks with high dividend yields and a low price-to-earnings ratio – also known as Value investing.

And from an early retirement perspective, retiring based on a diversified stream of dividends, rather than a fluctuating set of share prices, leads to a much less volatile financial life. When the stock market dropped by over 50% around 2008, retirees living off of their dividends barely noticed, since the underlying companies barely cut their dividend payouts during that time.

As the final icing on the cake, dividend earnings typically increase along with inflation over time, making them a much more viable source of lifetime income than a mattress stuffed with cash or a savings account earning 1% interest.

We'll open the series with this guest posting from a guy who goes by the name Dividend Mantra. You can learn more about his philosophy by reviewing all his archives at dividendmantra.com.

What is Dividend Growth Investing?

MMM was kind enough to invite me to do a guest post introducing some of his loyal readers to dividend growth investing and some of the basic fundamentals behind this investment strategy. I'm not going to get too crazy with numbers and ratios, but instead I'm going to focus on the qualitative nature of this investment strategy.

A Little About Me

First, a little background on yours truly. I was born in 1982 and got serious about saving, living frugally and investing in mid-2010. It was when I found out that my net worth was negative and I'd be likely working until I was dead that I decided to change my ways. I read a fantastic book, titled Your Money Or Your Life, and this definitely transformed my relationship with money and the way I looked at work, money, consumption and time. I decided that the limited time that I'm given here on Earth should be used how I see fit, and not in exchange for bigger and better objects in an endless pursuit of the enigmatic Mr. and Mrs. Jones.

I now save well over 50% of my net income and invest that excess capital into dividend growth stocks. Although I highly recommend diversifying your capital into multiple investments, I'm going to just concentrate on stocks today as that is primarily where my net worth lies currently.

Simpler Than You Think

Dividend growth investing is a strategy of investing whereby an individual engages in long-term investments with quality businesses that are expected to grow revenues, earnings and dividends over a long period of time by selling/manufacturing/distributing products that people want or need every single day. These investments are made by purchasing common stocks of these businesses that pay quarterly, semi-annual or annual dividends to shareholders. These companies typically have a long-term successful track record already behind them. Examples of these businesses include Coca-Cola, Wal-Mart, Colgate-Palmolive and ConocoPhillips. These businesses are all generally household brand names that produce quality products that people want and need. I try to invest in companies that I use every day. Although I'm significantly frugal, I still drink Coke, I brush my teeth with brand name toothpaste because I trust it, and I shop at major retailers like Wal-Mart because they're convenient, cheap and usually centrally located along a bus line. Speaking of the bus, it runs on gas…which is refined from oil. Although I don't own a car, I still have an indirect need for oil which is where investments in quality, large international oil producers like ConocoPhillips come into view.

Concentrate On Value, Quality And An Economic Moat

Although money managers and brokers want you to believe that investing in the stock market is incredibly difficult, it's really not. Notice I used the word "investing" in the preceding sentence. Long-term investing in the stock market is an incredibly efficient way to build wealth for a patient and focused individual. People who trade in and out, hopping from one investment to another are simply transferring their wealth from their wallet to the brokers that facilitate trades. That is not investing; that is betting.

Concentrate on value. Any object or service in the world has a price and a value behind it. Price is what you pay, but value is what you receive. It's no different with stocks. Paying a premium for a quality business will always be better than getting a "steal" on a stock with a lousy underlying business. I typically try to invest in quality companies that have a price to earnings ratio (the price you're paying for the earnings of the business) of less than 20, and preferably less than 15. With a price to earnings ratio of 20, that means I'm paying $20 for every $1 of earnings. A lower valuation, and consequently a lower p/e ratio, means that investors are expecting lower growth going forward. It's important to realize that the market isn't always correct and it's key to capitalize on businesses that are high quality and trading for a cheap price. At that point, you're getting great value for a cheap price.

Concentrate on quality. Recognizing quality is key for a successful investor. Quality is usually backed by a consistent product with a brand name that people are usually willing to pay a premium for. Again, going back to my Coca-Cola example, I'm willing (even as frugal as I am) to pay a premium for Coca-Cola over store-brand cola because to me it tastes better. I'm certainly not alone, because Coca-Cola sold over $35 billion worth of products last year. If you want to commit money to an investment it's probably a good idea to try the product if it's applicable. Want to invest in McDonald's? It's easy to check out a couple different locations and see if they're busy, serving a consistent product, clean and offering efficient, quality service. This isn't always applicable to an investment, but if it's available to you it's a good idea to see the company behind the stock. The key is doing your research and discerning quality.

Concentrate on companies with an economic moat. An economic moat is a competitive advantage that a business has that prevents other businesses from infringing on its market share. Companies that have pricing power, economies of scale, brand names, large distribution networks and barriers to entry have economic moats. Think of a company like a castle. The larger the moat around that company, the better defense it has against outside forces (competing companies). Coca-Cola has a large economic moat because of its global footprint, large brand name exposure, quality of product and economies of scale through volume and distribution. These aspects of Coke's business are extremely attractive and that's why Coca-Cola usually sells for a premium over its competitors. They have a majority piece of the market share in almost every market they compete in. That provides an investor peace of mind and the odds are strong that this company will be able to continue to boost earnings and dividends for many years to come. Do you ever see those old ads for 5 cent Coke bottles? They don't sell for that anymore. That's called pricing power. This is important, as a dividend growth investor is looking for dividends that grow at a rate that exceeds inflation. Growing dividends come from growing earnings and cash flow. You can't increase earnings if you don't have pricing power.

My Strategy

I personally invest the majority of my net income into quality dividend growth stocks every single month. This is a form of cost averaging for me, as I do not believe in timing the market. Some months the market is down, and some months it's up. I try to buy on dips within each month. I try to commit at least $1,200 to each transaction, so as to limit the effect of broker fees. I use Scottrade, and they currently charge $7 per transaction. I use income from my paycheck and combine it with dividends received from the prior month and used that combined capital to purchase shares in quality businesses. For instance, earlier this month I purchased 35 shares of Illinois Tool Works (ITW) at 46.68 per share, 30 shares of Emerson Electric (EMR) at $50.88 per share and 50 shares of AT&T (T) at $28.87 per share. My ultimate goal is to produce a passive stream of income from dividends that exceed my expenses, thereby rendering me financially independent. My expenses currently hover the $1,100 mark per month. I expect my dividends to exceed my expenses before my 40th birthday.

For beginners I would recommend building a core portfolio around large dividend growth businesses like Procter & Gamble, Coca-Cola, Pepsi-Co, McDonald's, Wal-Mart, Johnson & Johnson and similar companies. These are typically consumer based stocks that aren't as hard-hit when economic dips occur. Once you have your core portfolio built, you can branch out into companies in other sectors that still produce quality products and have a long-term track record of raising dividends and earnings at a rate that exceeds inflation. Companies like Exxon Mobil, Intel, General Dynamics, Illinois Tool Works, Medtronic and Visa come to mind here.

In Conclusion

I didn't want to get too detailed with numbers, ratios, balance sheets, cash flow statements and the like. I wanted this to be a basic primer on dividend growth investing and I want prospective investors to always remember the basics. When you're looking at stocks, you're looking at owning a piece of a company that produces something of value. If you don't personally see how that value translates to long-term growth then it's probably a good idea to invest your money elsewhere.

Full Disclosure: I'm long ITW, EMR, T, XOM, INTC, GD, MDT, PG, KO, PEP, JNJ, WMT, MCD, COP.

Thanks for reading!
Dividend Mantra

Update from MMM : This fantastic guest posting ended up sparking a huge and somewhat unruly discussion in the comments. Experienced stock investors may enjoy reading through, while beginners might end up more confused than when they started.

Writer J.L. Collins took the time to make a nice summary of the arguments with a clear summary here: http://jlcollinsnh.wordpress.com/2011/12/27/dividend-growth-investing/

Future tip: the comments section of this blog doesn't work for big discussions longer than about 10 exchanges. Every opinion is welcome, but if you ever get riled up and want to *take it outside*, why not head over to the Reddit Financialindependence section and spark one up there? Lots more fun and more wise people to weigh in. Then post a link to your new thread in the comments section here.

Prospering in an Anti-Mustachian City

By Mr. Money Mustache

Wed, 28 Dec 2011 12:57:50 +0000

 I’ve just spent the past week in one of the Earth’s ultimate hotbeds of shiny and beautiful, yet occasionally stupid and irrational, prosperity: Phoenix, Arizona.

Now, I’m no stranger to riches – I grew up moderately-rich Canada, before moving to the ultimately-rich USA. Since then, I have visited pretty much all of this country’s biggest and richest cities from coast to coast through a mixture of business and pleasure trips.

But spending some more time in Phoenix for the first time since becoming Mr. Money Mustache provided me with a new opportunity to have my mind exploded. Let’s do a little summary, in case you’ve never been there.

Phoenix is a giant sheet of city that has been stamped down on an infinitely large expanse of flat desert plain, with nice mountains out on the horizon in each direction. If you were playing a video game where you design cities, and you zoomed out to the maximum level and clicked the mouse in one corner and dragged and dragged diagonally and kept dragging until you reached the maximum size limit, you would have designed Phoenix. There are a few small scenic mountains sprinkled throughout middle, just to keep things interesting.

There is an infinite amount of flat space in which to expand, no rules against sprawl, and unusually good access to electricity, water, and mining wealth. When you add in a climate of constant heat and sunshine that keeps plants growing and buildings and concrete looking shiny and unweathered forever, this city is a nice experiment in urban planning under the heading "what if you put all the video games settings on "easy" and see what happens".

The result is astounding. Although the city was small only a few decades ago, it is ENORMOUS now, stretching about 62 miles (100km) when measured diagonally. Inside, every street contains about 6 grotesquely wide lanes, all packed with $100,000 cars and SUVs driving quickly through well-timed traffic lights at the 45MPH speed limit. On each side of each road is a row of fancy gardens and palm trees, then a thousand-acre parking lot, then a row of gleaming office buildings or high-end retail stores made of glass, copper, and aluminum. At intervals, you will see wide winding streets leading to residential areas off to the side where large stucco luxury homes with tile roofs and impeccable landscaping perch on large lots behind "no parking" signs. Then if you drive far enough, you'll eventually reach an airport-runway-sized intersection where you are offered on-ramps to the freeway that runs on a hundred-mile-plus journey around the city. Once on the freeway, you'll find an infinite number of lanes of immaculate black pavement, moderately but not overly packed with $100,000 cars and SUVs traveling at about 75MPH. Each vehicle is always populated by only one person, of course.

If you live in Boston or Toronto, or if you spent your youngest years in a poor small town like I did, it can all sound a bit mouth-watering at first. Phoenix is a driver's paradise, and I found myself fantasizing about owning an electric Tesla Roadster if I lived there to make the most of the conditions.

But then I slapped myself in the face and realized how stupid it all was. Here I was surrounded by a bunch of tragic, clueless people who actually thought it was a good idea to spend $100k on their cars – even while statistically speaking I knew that the majority of them were compete fakers who couldn't actually afford the cars (most high-end cars are still bought on credit, by people with less than $1M net worth). These people were all driving around, despite the fact that there were totally empty wide sidewalks and bike lanes available and the weather was beautiful. And they were spending hours going from one store to another to take care of their basic needs as well as to buy plenty of useless yet expensive crap. And it was happening every day, multiplied across an area of over *one thousand square miles*.

Even I found myself driving the family around excessively: in the process of going out to hiking spots and other attractions and meeting up with people, we cranked out about 250 miles on the car, all while ending up at the same hotel we started at at the beginning of the week. Doing the math, this put us up at almost the national average driving level, and it felt weird – almost all my memories involve whizzing along a highway in one direction or another.

I even drove to a grocery store, if you can believe it – the nearest shop was a Trader Joe's about 2 miles from the hotel, but with no bike and no knowledge of the area, I actually voluntarily got into a car and endured six-lane intersections and car lineups and a treacherous U-turn. All to travel TWO. MILES. I felt like a complete idiot after that experience.

All of this made me wonder: was this city crushing out all of Mr. Money Mustache's superpowers? Am I only able to live an efficient life because I live in a city that is only 5×5 miles? How can someone grow rich in this bigger city, when the social norms are all based on overconsumption and extreme amounts of driving? There are no positive role models to live up to, so you'd expect easy credit to rule the day. And rule it does: Phoenix had one of the biggest credit-fueled house price booms in the country in the mid-2000s, and is still reeling from one of the biggest crashes to this day. $50,000 house with palm trees on a golf course, anyone?

But never fear, because there IS an answer. You just have to dare to be different, just as I always suggest.

During the visit, I had the good fortune of meeting up with several groups of Mustachians who responded to my earlier invitation. Different people came to various events* and I got to hear the insider's perspective on growing a Money Mustache in the desert. One guy had strategically arranged very low housing costs for himself and was saving about 60% of his tech worker salary. Another had sold his car almost a year ago and was happily traveling everywhere by bike. A couple with two young kids had sold both of their expensive cars and bought a single older Honda minivan with hail dents at a massive discount, slicing their car expenses way down – and they are now in the process of renting out their paid-off house and buying a new deeply discounted foreclosure house close to work to eliminate a commute. And still other newer converts were just coming to terms with the idea that they could become debt-free forever, but had not yet put all the steps into action**.

By the end of the week, I was starting to get a handle on living there, and I think the same methods apply in both giant rich cities, and small average cities:

1: Lead a Local Life:
Just because the Phoenix metro area all *looks* like one city, doesn't mean you have to treat it like one. For example, we know that my own city is about 5 miles square. Then there's a 12-mile stretch of mostly open terrain, and the similar-sized city of Boulder starts. A few more miles of cows, then you get into the 2.5 million person Denver metro area. From my house to the very heart of downtown Denver is about 38 miles by road. But I don't just hop in the car to go there for a sandwich! That's several worlds away, and if I found myself needing to visit there more than about once a year, I'd seriously consider moving there to reduce the commute. This is to be compared with the 62 mile diagonal width of Phoenix (from Sun City to Apache Junction), 80 mile length of Los Angeles (Northwest corner just before Simi valley, down to Mission Viejo) and 65 mile sprawl of San Francisco/Silicon Valley (San Pablo to Los Paseos). If you're wondering how I define the edge of a metro area, it is this: the buildings are gone and you see only cows, cacti, or snowy mountains.

Using my local lifestyle rules, even a trip to Boulder is a special occasion that would have to involve seeing people that I really like and hopefully several courses of delicious food. I'm not going to drive to Boulder just to get my nails done or pick up some used beermaking equipment from Craigslist. That shit can wait, and we've all got other local things to do on our to-do lists.

This local lifestyle applies to finding friends too. I have dear friends that live outside of biking distance, and great friends that live well within. I spend a lot more time with the local ones, which leads to meeting more local friends, which further builds the non-car lifestyle. I miss you guys, all the girls and fellas living down near Denver.. but living a real life (and the accompanying early retirement that it leads to) is worth making a few choices for. You still love your friends in other states, right? But you don't fly there after work on Wednesdays for a poker game. It's the same thing.

Once you open your eyes to what is near you, you realize you don't have to travel as far as you thought. Opening up Google Maps for the area near my hotel, I see there is a bike-friendly route that would take me 1.7 miles to Trader Joe's, Costco is 3 miles away, and there is a huge business park to the East with financial, high-tech, medical, and outdoors companies. I could get a job there if I needed one. There's also the McDowell Sonoran Preserve just another couple miles East as well as golf courses, restaurants, all the usual high-end car dealerships, a fucking enormous shopping mall, and plenty of people. So even in the most distant and glitzy Scottsdale area at the Northeast corner of Phoenix, a local life would be possible. Better yet, if I was moving there I would choose Tempe, in the area near the university, the waterways, and the nightlife and light rail line. Down there, people actually ride bikes.

2: Convert Envy to Pity:
With transportation addressed, the other factor is *what other people think of you*. Or more accurately, *what you think other people are thiniking about you*. Because regardless of reality, it's the way you feel about yourself that matters.

An Antimustachian would probably envy all the pale-skinned big-sunglasses ladies in their 50s driving the Mercedes AMG C63s ($95,000, 451 horsepower, as common in Scottsdale as Honda Accords in my hometown). "Wow, look at that beautiful machine – they've really hit the big time. I sure feel embarrassed parking my little Scion hatchback next to it".

But with enriched powers, you now *know* you are in the right. You can't afford that car right now, because you are not retired yet. So obviously it is only rational to want the least costly car for your needs, because your goal is financial independence. Any unnecessary spending is not a treat – it's a curse! It just sucked you away from the pleasure of being free for life!

But even more significantly, you wouldn't want that car regardless of your wealth. I could line my driveway with those things without going into debt, but holy shit, the very idea of even a quarter of that amount of money going to such an inefficient, uncharitable, environmentally unfriendly cause as a fast car just makes me want to pick up the thing and throw it into a metal recycling facility to reclaim its wasted resources. Money is not purchasing power – money is the freedom to live life and to do good in the world, and regardless of where you live, it must be respected properly.

3: Use the Fake Rich People to Your Advantage

Jobs in wealthy cities pay higher. People in these cities buy ridiculous things at high prices. You could be a Professional Dog Walker or a Poodle Groomer in Phoenix/Scottsdale and make $80,000 per year. I could open up a high-end renovations company there and jack up my own rates to $80 per hour ($160k annualized). Any losses caused by higher costs of living are more than compensated for by the increased income potential for a resourceful and entrepreneurial person. The key is to fine-tune your skills to meet the market. If you are never planning to work anywhere other than the Wal-mart or Subway, do it Detroit so you can live for free in an abandoned house. But if you're going to be around big-spenders anyway, you might as well capitalize on it!

So, thanks Phoenix for all the sunshine and the fun, and the education too. I'll be back!

*One of these people happened to be the guy who runs Global Bikes in Phoenix, and he and his wife even lent me a very sweet mountain bike and took me out on a cactusy roller-coaster of a trail out in the foothills. Thanks Nicole and Mark!
**(*like ditching the Toyota Tundra in favor of something with no loan and good for at least 35MPG, hint, hint ;-*)

Guest Posting – The Dividend Aristocrats

By Mr. Money Mustache

Mon, 02 Jan 2012 13:06:24 +0000

We'll kick off the new year with some more advanced study: here is another angle on Dividend Stock investing from guest author Sean Owen.

Sean is an engineer, lawyer, and writer. His articles on investing and finance have been featured by Forbes, the Huffington Post, and Seeking Alpha, among others. He blogs about [financial indepedence and sustainable living] at RenewableWealth.com.

The Aristocrats

Now that you've had an introduction to the wonderful world of dividend investing, you might ask yourself, what could be better than a company that pays you every quarter for the privilege of having you as a shareholder? How about a company that gives you a raise every year? It turns out that there are a number of companies out there with a proven track record of doing exactly that, and there's an easy way to find them.

Enter the Aristocrats

No, I don't mean the aristocrats from the infamous joke you may have heard about. The S&P Dividend Aristocrats is an index that consists of companies that have raised their dividends every year for at least 25 years in a row. This is an elite club indeed, because if a company ever misses a single dividend payment, or ever fails to give investors a raise, then it is booted out, and must start that 25-year clock all over again if it wants to get back in.

The index currently includes many familiar companies, like Johnson and Johnson, McDonald's, and Wal-Mart, but there are others on the list that aren't necessarily household names. Companies like Abbott Labs, Dover Corp, and Pitney Bowes may not make many headlines, but they have also paid increasing dividends for 25 years or more.

That period includes several nasty recessions, including the most recent one, which is the worst since the Great Depression. The share prices of these companies may have fluctuated during these rough patches, but they kept raising their dividends relentlessly through it all.

Boring is Best

Many people think of these sorts stocks as "boring." Traders often deride them as being for "widows and orphans." Many will tell you that a company that has paid increasing dividends for 25 years is too big to grow.

My response to that is, as my dad would say, *horse hockey*. The Dividend Aristocrats have outperformed the S&P 500 over the previous 5, 10, and 20 year periods — quite handily, in fact.

Here's another way to look at it: A company that pays steadily rising dividends is a company that makes *so much money*, year after year, that it simply can't use it all, and they believe the best use of all that extra cash is to reward their shareholders. That sounds like a company I want to own.

An Example from Warren Buffett

For a great illustration of the amazing power of dividend growth investment in general, and dividend aristocrats in particular, we need look no further than the world's greatest investor. Warren Buffett established a position in dividend aristocrat Coca Cola in 1994. Check out his comments on that investment from a letter to Berkshire Hathaway shareholders:

> Coca-Cola paid us $88 million in 1995, the year after we finished purchasing the stock. Every year since, Coke has increased its dividend. In 2011, we will almost certainly receive $376 million from Coke, up $24 million from last year. Within ten years, I would expect that $376 million to double. By the end of that period, I wouldn't be surprised to see our share of Coke's annual earnings exceed 100% of what we paid for the investment. Time is the friend of the wonderful business.

You read that right — by 2021, if Coca Cola stays on its current trajectory, the shares Buffett bought will earn more in dividends alone every year than his entire investment back in 1994. How's that for boring?

My Shares Have Gone Down? Awesome!

There's a sort of magic in investing in companies like these. When you stay focused on collecting your paychecks from the companies you own, rather than the share price, you can ignore the wild fluctuations in the stock market that keep less enlightened investors awake at night. You can simply sit back and collect ever-increasing income from your portfolio.

In fact, if you reinvest your dividends (which I highly recommend you do), you might just learn to love it when your favorite companies' shares go down. How can that be? Because those reinvested dividends will buy you more shares when the price is low, which will in turn earn even more dividends in the years to come.

Investing in the Aristocrats

So what's the best way to invest in the Dividend Aristocrats? One simple way is this the SPDR S&P Dividend ETF (SDY). This is an exchange traded fund that tracks the S&P High Yield Dividend Aristocrats index. This is a slightly different index which includes Dividend Aristocrats from the S&P 1500, rather than just the S&P 500, but it has the same 25-year dividend growth requirement. It has reasonably low expenses, and currently sports a very respectable 3.3% dividend yield.

If you don't want to put a whole lot of time in learning how to evaluate individual stocks, you could very well just stop here. The holdings in SDY are quite well diversified, and represent many of the most rock-solid companies across a wide variety of sectors. It's a portfolio that will let you sleep well at night, whichever way the market is moving.

An Elite Cheat Sheet

If you prefer to pick your own stocks, whether you're a seasoned pro or just starting out, there are no shortcuts. Doing your homework on each and every stock you consider for investment is absolutely essential to your success. It can be a daunting task when you have thousands of stocks to choose from.

The 2012 High Yield Dividend Aristocrat index only has 61 companies on it, though. If you narrow your search to these, doing your due diligence suddenly feels a lot more doable.
In fact, it's perfectly feasible to do a thorough analysis on each and every company on the list, and that's precisely what I recommend you do before investing a dime, especially if you are new to investing.

For a great primer on valuing stocks, check out the Intelligent Investor, by Warren Buffett's mentor, Benjamin Graham. Read it, and then get to work combing the Aristocrats for bargains. It will be time well spent. You will be a much better investor when it's done, and you will have an opportunity to practice the #1 most important skill for any investor to have: patience.

This Old House (Cheap Edition)

By Mr. Money Mustache

Wed, 04 Jan 2012 13:13:22 +0000

Foreclosure Project will be coming to an unexpectedly successful early end. It took a big push by all of us at the end of December, but the house has now officially become an income producer. And it is producing at $1200 per month versus the $1100 I originally estimated it would fetch!

But we'll talk more about that aspect of the project in the near future – right now we still have to cover more details of the renovation that allowed such a nice success in the rental department.

As you know, this project involved a rather old house. Built in 1935, this place has seen the second half of the Great Depression and the golden age of steam trains in its lifetime. When you're working on a house of that age, almost every project can open up a can of worms. Plumbing from this era involved plenty of cast iron and lead. Electricity was a relatively new invention, so wiring was crude and outlets and light fixtures were sparse. Insulation consisted of putting on an extra sweater and adding a log to the woodstove.

In an old house, you’ll also often encounter crooked walls, crumbling foundations, leaky and non-functional windows, and warped floors. All of these things can be fixed, but each will tend to cost more to fix in an old house than they would cost to build from scratch in a new place.

So to profitably fix up an old house in anywhere but the most expensive cities (where the increase in property values might be enough to make any renovation worthwhile), you have to work with a careful sense of “know when to hold ’em, know when to fold ’em”.

We bought this particular house at just over $100,000 from a bank, and the current market value of a place of its size in good condition in this area is around $185,000. So we had some wiggle room, but not an infinite amount. And with the goal being a reliable and profitable rental house, we wanted every dollar spent to increase both rental value and eventual resale value enough to make it worth spending.

With those goals in mind, here are a few of the design and improvement ideas we did, along with some cost-saving tricks that helped improve the profit margin.

Floorplan changes:

Wider front door (acquired

used for $20!), just after it
was installed into new
framing

It is messy and somewhat labor intensive to break down walls and rebuild them or frame new openings. But these drawbacks are often overpowered by fact that the materials required are dirt-cheap and you can totally transform a house by doing it.

Most home buyers or renters make decisions emotionally, and they will perceive floorplan improvements as “flow”, “feng shui”, or even the “energy” of a home. In my own lingo, what they are really seeing is “a large entry room with a view through to the back of the house”, “wide doorways”, “large windows and high ceilings”, and “plenty of natural materials like wood, stone, and tile rather than carpet and vinyl”.

In this house, we opened up the doorway between kitchen and living room to be about five feet wide and eight feet high, which allows people to see, converse and walk easily between both rooms – especially handy when hosting parties.

I also added a wider front door, and rebuilt one doorway to the bathroom and added a second doorway on the other side, adding bathroom accessibility from both bedrooms, and also creating a “circle” in the house where you can get to any room from either direction. Kids love this feature for running around, and it’s comfortable for adults too, making getting around the house more natural and efficient since you can pick either of two directions.

Overall, we spent about 20 hours opening up these walls and installing the new trim and bathroom doors. Including materials, the cost would be just over $1000. At well under one percent of the final value of the house, it is a hugely profitable change to make, because it greatly broadens the potential customer base.

This is my friend about to jack up the house. Note the honeybadgerlike disregard for dirt and spiderwebs.

Structural Improvements:

This old house had some very crooked areas in the living room and kitchen floors. The doorway between kitchen and living room also had a sloped top with a big crack in the wall above it, reaching to the ceiling. Peeking into the crawlspace beneath these peaked areas, I found some old support columns supported by stones laid in the dirt. It became obvious that the house's old stone perimeter foundation had settled due to moisture in the soil, while the dirt safely in the middle of the house had stayed dry and remained at the same height. This caused the support columns to effectively jack up the middle of the floors, creating waves.

To fix this, we crawled down into the dirt and used a hydraulic car jack to lift the floor structure off of the column, then remove the column. Then we released the car jack, which allowed the floor to settle back down to become level. The floor still retained some of its crown, so we left it unsupported for several weeks while we worked (storing our heavy pallet load of tiles and mortar there to add weight), to give it a chance to settle. At the end of December, it was fairly level so we reinstalled some new, shorter support columns to lock it into place and provide rigidity.

A Bit of Luxury in the Bathroom and Kitchen:

I built this custom fully-tiled shower to add a feeling of substance to an otherwise small bathroom.

One of my theories of why I get better than average results as a landlord is this: *I recognize the fact that Tenants Are People Too*. Most landlords look for the cheapest crap they can find when preparing a rental house: plastic shower enclosures, laminate bathroom/kitchen countertops with the $29 shallow sink and plastic-handled faucet.. vinyl floors, old coil-burner electric range, and other trash. "Tenants don't care", they tell me.

I say they are wrong. Tenants are just like homeowners, looking for the nicest living environment they can find at a price they can afford. Often younger and accustomed to basic apartments, they are very pleased to encounter a rental house that shows some attention to detail. This helps you attract higher-income tenants who actually love your house – and who will thus take better care of it and be more likely to pay the rent.

These details cost very little to provide – during the renovation stage you can make upgrades throughout the whole house at a cost equal to only 1-3 months worth of rental income. But they generally raise the rental income so much that they are like getting a 20-100% annualized return on your investment.

The picture above shows the new shower. It was not overly expensive to make, and I used plenty of tiles left over from other projects. But by avoiding a plastic showerpan and pouring my own from concrete, as well as building in some shampoo nooks and bringing the tiles all the way to the ceiling, I tried to create a comfortable lair that just asks you to get naked.

This old sewing table, priced at $20, became the new vanity.

Another fun example of cheap luxury was in choosing the bathroom vanity. I originally budgeted $400 for a reasonable cabinet, sink, and faucet. But space was limited, so I was thinking I'd have to build my own to fit the floorplan. Just before building it, I got an email from my friend, who was at the used building materials store right at that moment: "Hey! I may have found the perfect vanity". He snapped the picture at left on his phone and emailed it to me.

I was even able to make that lower shelf using scraps acquired from cutting down the table.

I was skeptical at first, since it was still six inches too deep to fit the space. But for the price, we decided we could risk cutting it down to size. That cool copper-toned sink and faucet were a matched pair bought from Overstock.com for about $200 including shipping. With some table saw and plumbing trickery on my part, and stain wizardry from the friend, the end product looked like this:

-

Paint Galore:

Before Paint

Old houses in poor condition usually have bad paint colors, with plenty of chips and stains in the finish. Ours had that, and it was also cursed with a bland white exterior. To complete the look, all exterior walls were completely plastered with hideous and unnecessary wiring and other barnacles: There was a Dish network antenna right on the street-visible South side. Plus TV, electric, telephone, and cable wires haphazardly spaghetti-ing around on every surface. With great pleasure, I ripped them all down before

After Paint – I also leveled the front porch and made some new wood support columns. The frayed shingles were replaced shortly after this picture.

painting, rerouting only the cable TV and landline telephone wires that come from the telephone poles in the alley – these I attached to the hidden North side of the house so the services will still be available. But any new wiring to rooms will be done properly through the crawlspace, instead of stupidly on the outside of the house. A complete interior paint job was done as well, featuring bold natural tones with clean white semi-gloss trim to suit the traditional nature of the house.

Low Cost Niceness in the Kitchen:
Kitchen cabinets are expensive, often costing $10,000 for a medium-priced set in a medium-sized kitchen. That's what you will pay if you special order Kraftmaid or similar brands from Home Depot or Lowe's. When pricing them out for a high-end new house, I even received quotes up to $20,000 for a similar level of quality from smaller local cabinet companies. Later I discovered a secret workaround to all this: buy your cabinets at Ikea, where they are just as nice as the other spots, but about half the price due to self-assembly.

But in a house of this price, we didn't even want to spend five grand. Instead, we restored the existing base cabinets, and I used some eco-friendly blue stained (aka "beetle kill") wood from local forests to build open-front shelving units instead of the old upper cabinets, and I also made some countertop units for the other side of the kitchen, where there were formerly just naked appliances sitting on the floor. We made it all blend together by creating tile countertops for both sides. I won't pretend this is as nice as a new set of Ikea cabinets, but when you see it in person it adds great personality to this old rustic house, and is quite functional too – for about 80% lower cost even after paying myself for labor.

Before: Shitty appliances sitting in the middle of nowhere

After: Reasonable smooth-top range (craigslist) nestled between simple custom countertop units. You can also see the new paint and bigger doorway to living room.

We also replaced the appliances, scoring a fairly new matching set in black. There is a smooth-top range and a double door 23 cubic foot fridge. These suckers are worth about $1600 combined new, but thanks to Craigslist we scooped them for $400.

The new kitchen also features a really deep basin cast iron sink that I salvaged from another customer's kitchen renovation several years ago (value about $240), and a tall arched pull-out/spray faucet in dark bronze finish ($160 new). The sink is white, which contrasts nicely with the brown sand tone of the tile countertop, and the dark metal of the faucet.

A sink/faucet combo like this is rarely found in a house of this price range, but that is deliberate: it's a prominent centerpiece in the new kitchen, and people tend to walk straight over and touch it. The quality from that area seems to flow to the rest of the room, convincing you that the whole kitchen is stylish and fancy, when in fact it is was extremely cheap to build.

There are many more examples of these low-cost upgrades we were able to score, but unfortunately the house rented so quickly that I haven't even had time to take nice pictures of the finished work (the pics in this article are just quick iPhone ones). But when you think about it, that's really the point of all of this: create a new house out of an old one, cheaply, and impress your potential customers so much that the first one to walk in, rents it at full price.

It really is so much fun. Do you see why I can never quit this job?

The Triple M Reading List

By Mr. Money Mustache

Fri, 06 Jan 2012 13:00:24 +0000

Books are great. They provide a never ending path of free, or nearly-free education that you can walk along for your entire life, taking branches here and there as you see fit.

The reason I like non-fiction books as a source of learning is because they typically represent so much concentrated effort on the part of the author. Somebody worked for many months or even years on this thing, researching and refining it, and you get to just flip it open and suck up the entire contents in just a few days.

If you keep up the habit over time, you'll end up with the equivalent of several more university degrees above and beyond your first one, yet it will cost you virtually nothing. Because of this, I suggest to all the youngest Mustachians that you spend at least a couple hours per week working your way through nonfiction books on things you want or need to learn about. And financial topics are a good thing to have in the roster.

I've reviewed a few books on this site so far, and have many more reviews coming up. I also get quite a few recommendations from readers, and I've read some of those too. I also find myself repeating certain book titles over and over as recommendations for new people who write in looking for advice.

So I thought we could put it all together in this Official Reading List article – I'll start by summarizing the good books that come to mind, then you can add more in the comments along with your own description.

Then I will collect it all up and move it to become a dedicated link at the top of this page for future reference for everyone in the future.

Investing and Finance Books I've read and Liked:

Economics Explained – see book review

A Random Walk Down Wall Street by Burton Malkiel **–** a great explanation of why index investing rules, written by a very wise professor/investor guy who has personally researched and debunked most of the common "wisdom" that exists about stock trading today.

The Intelligent Asset Allocator – by William J Bernstein **–** examines the effects of mixing stocks, bonds, and other assets into your portfolio in different proportions. Explains that with very little effort, you can drastically reduce the volatility of your investments, even while maintaining the same level of overall returns.

Towards Rational Exuberance by B. Mark Smith – a well written history of the stock market dating back to the 1800s, which describes the old corrupt capitalists and mustachian heroes of old, the forming of the Federal reserve to stabilize the financial system, the conditions that led up to the great crash of 1929 and the ensuing Great Depression, the New Deal and securities act of 1932, and everything since then.

The Little Book that Beats the Market by Joel Greenblatt – describes a method of stock picking which has historically performed much better than the stock market as a whole. It's really just a complicated form of value investing.

Early Retirement Extreme by Jacob Fisker – see book review

I Will Teach You To Be Rich – Ramit Sethi – see book review

Your Money or Your Life – Joe Dominguez and others – one of the Founding Documents of Mustachianism – explains that money is not for buying shit, it is for the purpose of attaining freedom.

The Millionaire Next Door by Thomas Stanley/William Danko – see book review

The Automatic Millionaire Homeowner by David Bach – a book about investing in single family rental properties with an emphasis on setting things up to run automatically, keeping you free to expand the empire. Not entirely Mustachian in nature, but a good intro nonetheless.

Rich Dad Poor Dad by Robert Kiyosaki – a spunky rich guy explains his upbringing with two 'Dads', one a middle-class big spender who never became financially independent, and the other a businessman/investor who thought of his money as investment capital rather than just something to spend.

Philosophy:
Guide to the Good Life: The Ancient Art of Stoic Joy – see sorta book review

The Magic of Thinking Big: a 1950s classic by David J Schwartz – the book that made me permanently happy – see book review

Biographies/Autobiographies/Memoirs/etc.:

The Snowball by Alice Schroeder – this is the complete story of Warren Buffett's life. (He's old, so there are over 700 pages).

Dreams from my Father and The Audacity of Hope by Barack Obama – books from the current Big Man, the first one from before he knew he would be a big politician, and the second one from when he was gunning for the presidency. Since he wrote them with his own hands, you get a much better idea of who he is as a person, and can then judge more accurately what the media on both sides is saying about him, as well as more accurately predicting the direction of the country if he gets re-elected in 2012.

Applied Math:
Struck by Lightning .. The curious world of probabilties, by Jeffrey Rosenthal – This book sums up my decision making process whenever

anything is unknown. The basic idea is: understand how fun and useful probabilities and statistics are. Then USE them to avoid making unwise and expensive decisions out of fear, such as buying Rolex Watch insurance or driving an SUV instead of riding a bike for "safety" reasons while allowing an overweight physique to persist for decades.

General Science:
The Selfish Gene by Richard Dawkins – an explanation of evolution since the beginning of life that explains things from the perspective of individual genes. It makes so much sense and is so brilliantly written, that it pretty much obliterates any mysteries as to why any living thing on Earth is the way it is – including humans with all of our fussy little needs and moods.

——-

Still to Read, as recommended by readers:

The Intelligent Investor *by Benjamin Graham*

The Only Investment Guide You'll Ever Need
by Andrew Tobias (Paperback)

Naked Economics: *Undressing the Dismal Science (Fully Revised and Updated)*
by Charles J. Wheelan (Paperback)

Guide to Economic Indicators*: Making Sense of Economics (The Economist)*
by EconomistStaff (Hardcover)

The Four Pillars of Investing *by William Bernstein*

How the Economy Works*: Confidence, Crashes and Self-Fulfilling Prophecies*
by Roger E.A. Farmer (Hardcover)

Scratch Beginnings*: Me, $25, and the Search for the American Dream*
by Adam Shepard (Paperback)

Plenitude*: The New Economics of True Wealth*
by Juliet B. Schor (Hardcover)

What Technology Wants
by Kevin Kelly (Paperback)

The Life You Can Save*: How to Do Your Part to End World Poverty*
by Peter Singer (Paperback)

Against Thrift*: Why Consumer Culture is Good for the Economy, the Environment, and Your Soul by James Livingston (Hardcover) <— need to read this one just because the title sounds so evil!!*

Nudge – on decision making

"7 Laws of Money" by Mike Phillips

What do you think? Any favorites or recent finds that transformed your knowledge and pushed you up to a higher level of understanding? Share them in the comments!

As a reminder, don't just go running to Amazon if you decide to read any of these – check your library first. If that fails, there's also a link to Better World Books at the bottom right of this site that often has cheap used copies, plus does great charitable activities with a good slice of the proceeds.

happy reading!

Getting Around the Blog

By Mr. Money Mustache

Sun, 08 Jan 2012 16:10:03 +0000

 MSN.com (the 13th most viewed website in the world, apparently), and it sent quite a flock of people here.

It was a bit embarrassing, since the article was described as a "guest posting", but really it was just an existing article scooped from the archives ("A brief history of the 'Stash"), so it didn't really have the kind of style or approachability that a guest posting should have. It was just a quick one I had typed up for you personally one day with no thought of the outside world. Plus, they covertly took out the swearing, which was my favorite part.

Partly because of the tone, and partly because of the fact that we live in a world of at least 38% hopeless complainypantses, the comments section on MSN has sprouted a rich and smelly list of complaints. I look forward to heading over there for a harvest some day with my copy/paste buttons.

But oh well, all publicity is good publicity, right? And to those stronger people who came from MSN and decided that maybe there was some useful stuff to be learned over here – thank you, and welcome!

So the real point of all this is, there are always a few new people showing up these days in the middle of this long story we are sharing. They have questions and want to know what the Mustachians are all about. How can they do it?

Quick Reference: Directly to the right of the list of articles on the front page, you'll see a box labeled "Google Custom Search". Try it out – it is a perfect search engine for all 600+ pages of this site's content, and it is fantastic. For example, one friend told me the main reason he enjoys this blog over all the other personal finance options out there is because I am the only one who threatens to punch people in the face. So I typed in "Punch" to the search box, and learned that in fact I have only done that 19 times so far. Probably something I can improve. So if you want to know what the MMM family does about kids, health insurance, groceries, or anything else like that, try the box.

Full Research: As mentioned in the "Welcome new Readers" box in the top right corner of the front page, the articles are all linked in chronological order. If you ever feel like reading the WHOLE STORY, you can easily start at the very first article, then use the little link at the bottom of the article to move on to the next one. Save a bookmark when you get bored, then come back and read more some other day. There are somewhere close to 200 posts now, and over 5,000 comments. Some people write to me and tell me they have read the whole thing, including all the comments. This blows my mind and I am not vain enough to think my stuff actually deserves this much attention, but those folks definitely have earned the title of Senior Mustachian and should feel free to flaunt it. I even authorize you to make a customized mustachioed avatar at gravatar.com to appear next to your comments.

Further Clarification: I also get emails asking for information. Sadly, I can't answer them all, otherwise I would not have time to write anything new or read any books to learn more (I only get to use a computer about 1-2 hours a day, the rest of the time is spent being a regular family man). I still like hearing from people and I do get to read every one. So hopefully the steps above can answer some of the questions, and for specific ones I also recommend the Financial Independence Forum on reddit.

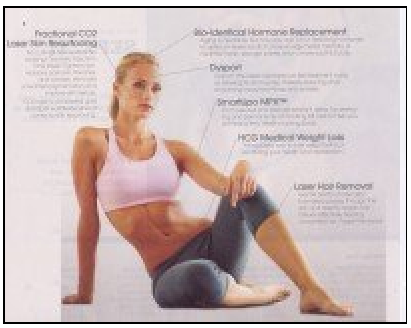
That's it for this Sunday edition, I hope you are having a great weekend!
love,

Mr. Money Mustache

You Can’t Cure Obesity with Bigger Pants

By Mr. Money Mustache

Mon, 09 Jan 2012 13:03:19 +0000



I was stumbling through my living room the other day, catching my feet on various building blocks, puzzle pieces, and a tangle of fishing line that had previously been used to suspend our homemade space station from the second floor balcony, when the thought occurred to me, “Damn, I sure wish this house wasn’t such an enormous mess!”

Mrs. Money Mustache must have read my mind, because right then she joked, “It looks like we really need to hire a house cleaner!”

All of us know this was said in jest, because come on, Mr. Money Mustache would not be seen outsourcing his floor sweeping even if he had wealth one hundred times greater than Warren Buffett’s bridge playing group. But just for a second the idea seemed comforting.

You see, we’ve been busy lately. I did a push to finish the carpentry work on the foreclosure project, we went away on vacation for part of the holidays, and Mrs. M. has been sucked into some honorable but rather draining work helping out her parents with a worker shortage in their family business. This means that nobody has been cleaning up the house for the last few weeks, and things have gotten crazy.

But instead of masking the problem with a housecleaner, we left it there to stare us in the face to remind ourselves that there is indeed a problem.

“Wake up, Mustache Family! You’ve overcommitted yourselves, and it’s time to scale things back to become more reasonable.”

Every day should include some time for peaceful reflection and reading, exercise, cooking good food, and a good night’s sleep.

If you scoff at this idea because your life is far too busy to allow it, let me put it this way: “Every person who is trying to saw through a twenty-foot thick tree trunk by hand, needs to take time occasionally to sharpen the saw blade when it gets dull”.

“But I’m too busy to sharpen the saw!!”, you say.

“Ok, fine, you keep sawing with that dull toothless saw, and I’ll take a rest while I sharpen mine, and we’ll see who gets through first”.

(*hint: it will be me)*.

So we made some adjustments to our lifestyle, and today I had time to do a wonderful cleaning and reorganization of the whole main floor of the house. It’s beautiful again, and my whole schedule has opened back up to include more free time.

Our next example is a thirtysomething man who is busy advancing his office career. His metabolism isn’t automatically keeping him slim anymore like it did at age 18, and he doesn’t have time to exercise. He has started to gain weight, to the point that his favorite office pants are now getting tight at the waist.

What’s the solution? Does he buy bigger pants? This would solve the immediate problem of belly pinching, and allow him to get on with more pressing matters, like continuing to perform well at the office, right?

My solution is the opposite: put those damned tight pants on and keep wearing them. When they bite at you, it's a reminder to take the stairs instead of the elevator, eat a piece of grilled salmon instead of a chocolate bar and bologna sandwich, and to start walking and biking more. Those tight pants are your biggest ally in addressing the underlying problem – if you give them up, you'll be allowed to forget what the real problem is: your lifestyle has become unhealthy and you're doing everything with a *dull saw!*

And there are so many more examples, once you start to view your life this way:

If you find it takes too long to get to your office by bike, you won't solve the problem with a car. The problem is not that biking is too slow. It's that you live too far from work! Keep biking to remind yourself of this, and the problem will solve itself, either through fitness or switching houses or jobs.

If the stairs to your 20th floor office leave you out of breath, the solution is not an elevator – it's a stronger body that can get you up in a timely manner! Keep walking the stairs and the problem will be solved properly.

If you find you don't have enough money to pay the bills or to afford something you really want, the solution is not borrowing the money! You have a problem of your wants not being aligned with your current financial reality. There are only two ways to fix this: earn more, or in many cases in wealthier countries, gain control of your wants, and therefore your costs.

On a bigger scale, when a city finds its road network overrun with automobile traffic jams, the solution is not to build more lanes for the traffic. The problem is that too many people are living somewhere that makes it easy to take a car to get to work. The solution is to reduce both the need and the incentive to drive! If the zoning allows plenty of housing to be built near the jobs and stores (increasing supply which drives down prices), and the roads are left crowded and unexpanded (which makes people dread the thought of buying a far-away house), guess what choice they will start making more often?

In all areas of life, embrace your problems. Solve the easy ones as quickly as you can. And as for the more difficult ones: let them build up around you and stare into your face so you can do battle with them like a real man or woman. Make no mistake about it – you can either have a good honest boxing match with each of your problems, and win eventually. Or you can turn your back on them, and they ***will*** walk over and punch you in the back of the head when you forget about them and start watching TV instead.

If you keep your problems visible, you'll automatically keep your life from getting unnecessarily complicated.

> "Oh yeah, I can't buy myself a horse for mountain trail riding, because I don't have time to ride it – my time is already occupied by keeping myself in good shape. Hey! Maybe I'll take up mountain trail ***walking*** instead!"

Problems are often incorrectly thought of as our enemies – things to be avoided and warded away with credit cards. But really, they are our best teachers. Do you like learning? There's no better way to learn than to be forced to solve your own problems.

Once you stop masking problems and truly realize that they won't go away until you solve them properly, you will find that you suddenly get serious about fixing them. And when it really comes down to it, all of the most serious problems of modern life are caused by not solving their precursors when they first come up.

Because of all this, I still have a fence that I've been planning to build for three years, and the vegetable garden went unplanted last year. I have not yet attained the Vin Diesel level of fitness that I promised myself back in the Health=Wealth article, and I'm not yet the drummer in a funk band even though I deeply desire to be one. I'm far from perfect, but I leave all these shortcomings out there staring me in the face and challenging me to get more organized.

Every year I am getting a little bit ahead – and so are you!

Getting Started in Carpentry – Tools of the Trade

By Mr. Money Mustache

Wed, 11 Jan 2012 13:00:35 +0000

After the latest progress report on the Foreclosure Project, several people were inspired and wrote to me with this question:

> I've always wanted to be able to do more of my own projects around the house, but I don't even know what tools I would need to get started. Where can I get this information?

There are probably many great books in the library about this, and other websites as well. But since I had to go through that exact same learning process myself over the years, I thought I'd share my own thoughts on it and perhaps help some people avoid repeating my mistakes. Sometimes, you just want someone to tell you exactly how to get started, as I tried to do in the Pex Plumbing Article.

The Secret Simplicity of Carpentry:
To an outsider, carpenters are sometimes looked upon as magicians. But when it boils down to it, the craft consists of repeating only these four steps: Design, Measure, Cut, and Attach.

You design with your imagination, possibly augmented with graph paper or Google Sketchup. You measure with a tape measure, ruler, various levels and squares, and occasionally angle meters. You cut with an assortment of power saws which grows as you advance (I'm up to about eleven types so far), plus drills and other rotary tools. And you attach with nails (usually from a nailgun), screws, glue, and other types of adhesives.

Design, measure, cut, and attach, that's it. Everything else is just fancy variations on those basic activities. The better you get at those activities, the better your work becomes.

A Philosophy of Tools: Quality vs. Price

A person who is "cheap" will focus only on price when making purchases, including tools . I've never been cheap (believe it or not), so I try to buy tools that give me a maximum level of usefulness (work quality and speed) and longevity, while still weighing these factors against the cost.

This equation also needs to take into account the frequency and value of the work you'll be doing with the tools. I'm a casual professional, so my tools need to help me produce somewhere between $5k and $100k of value per year depending on what projects are going on. Even at the lower end of that range, dropping from a $100 saw down to a $50 one that is noticeably crappier is a bad idea, because every cut I make will be less straight, and I'll waste time trying to make up for the bad cuts with other adjustments. More importantly, my quality will go down, and a lot of the fun in carpentry for me comes from producing the best quality stuff I can possibly make in a given amount of time.

But it is also possible to go overboard in this department. Boutique toolmakers exist in every category, daring you to upgrade from the $500 table saw that I use, to the $3,600 one. What I've found from using both types of equipment is that the returns at the higher end are rapidly diminishing, at my level of work anyway. My guideline for quality is thus simply "top-of-the-line of what regular stores like Home Depot or Lowe's carries".

In other words, my tools are a mixture of Dewalt, Ridgid, Hilti, Milwaukee, Makita, but not too much Black and Decker or Ryobi these days. However, thanks to the crazy productivity of Chinese manufacturing, even those cheaper brands have advanced sufficiently that they are plenty good for weekend hobby use, and you should not feel like you're cheating yourself by starting with them.

The Secret Place to get Cheap Low-Tech Tools:
The philosophy above applies to power tools like drills, saws, and other complicated instruments. But you also need plenty of basic chunks of metal like hammers, wrenches, and screwdrivers. Home Depot makes a good slice of its profit by selling these at much higher profit margins than it sells the power tools, because it's easier to mark a $3 (wholesale) hammer up to $20 without raising eyebrows, than it is to mark a $300 table saw up to $2100. But a few years ago, I discovered a place that sells reasonably good quality tools of this type at much lower prices – Harbor Freight Tools. Here's a link to that store. (It's a sponsored link, so I'll indirectly get a buck or two if you buy something there after clicking the link, but it doesn't affect the price you pay, of course):
Harbor Freight Tools WINTER SALE Expires: 1-31-12

The thing to note about Harbor Freight is that while their hammers and wrenches and even air tools and welders are great, the cordless power tools and more advanced things like table saws are often rubbish. So you'd be be better off picking those up at one of the standard retailers. If you're unsure about a certain model of big-brand power tool, just type its name in to a search engine and "review" to see what others have said about it.

Also competing with both Lowe's/Depot and Harbor Freight, is of course Craigslist. Just watch the price and age of the tools, since many of the sellers are contractors. Some of my brethren in the trade aren't the most craigslist-savvy people, so they often ask too much, or don't document the tool properly with pictures, don't respond well to emails, etc. The best deals I have found on Craigslist are on big old tools (lathes, bandsaws, etc), or big package deals ("contractor going out of business, here's my whole set of tools including an enclosed trailer for $4000").

With all that out of the way, here's my introductory tools list for various levels of aspiring carpenters and handypeople:

Level 1: stuff everyone needs:

Simple hand tools like screwdrivers, pliers, utility knife, wrenches, etc. These are usually most affordable when purchased in bulk, such as this kit at harbor freight, or similar ones at Costco. Throw in a tape measure, level, hammer, and studfinder, and you are already ahead of most of the home-owning public. With these, you can hang pictures, change your car battery, install a new dishwasher, change light and plumbing fixtures and door handles, and things of that nature.

Level 2:
Add a cordless drill (essential for driving longer screws and drilling holes). 18 Volt models are good, I like the Ryobi lithium battery drills as a model that can go from beginner to your first full house renovation.

Level 3:
Time to start cutting some wood. A good way to have basic cutting capability along with compact size and easy operation is to get a fully cordless system, right off the bat. In my opinion, the best cordless tool value on the market right now is the Ryobi Combo kit at Home Depot – the combo kits are a good deal, then you can add extra tools (there are many) as you need them. A cordless jigsaw is a particularly useful one. You may also want to add an orbital sander and possibly a belt sander at this point. Now you're ready to make desks for your kids, and shelves and simple backyard furniture for your house.

Level 4:
At this level, you will start wanting perfectly straight cuts in long pieces of wood, and perfectly square cuts across them. For these tasks, you need a table saw (the one I like by Ridgid is linked earlier) and a Miter saw. I use an almost identical earlier model of the Dewalt DW718 that I bought in 2000 and is still working perfectly to this day. If I was buying one today, I would probably choose the Ridgid 1290. In general, I've learned that Dewalt and Ridgid run neck-and-neck for high durability and quality, but

Dewalt often has stupid design flaws like switches and power cords in inconvenient places, while Ridgid tools are more well thought out. Since I need to move around a lot, I have my miter saw mounted to this Ridgid rolling stand, which I have fallen deeply in love with after using an awful non-rolling stand for the ten prior years.

Level 5: You're ready for fancy and fast attachment of those nicely cut pieces of wood. You can add a small air compressor and 18 gauge and 16 gauge nailguns. When you nail with a nailgun, the connection happens instantly with no wiggling of your wood. This lets you create furniture-grade quality, especially since the nail heads are so small they can barely be seen (and thus can easily be patched over before staining or finishing the woodwork). Nailgun and compressor kits are the way to go here, since you can get the complete system for $250 or so (or less at HFT). As an added bonus, the compressor will also come in handy for pumping up car and bike tires, as well as running other air tools you can get from harbor freight such as HVLP paint sprayers, ratchet guns, air chisels for chipping away old concrete and tile, etc.

Branching Out:
To create bathrooms and kitchens, you need to install tiles – a tile cutter (wet saw) and grinder with a diamond blade are essential for these tasks. For drywall, you just need some plaster ("mud") spreading tools along with a utility knife and cordless drill. We covered plumbing earlier, and welding will get its own article someday.

Efficiency:
When I graduated from homeowner to home builder back in 2005, I got to work alongside real professional carpenters for over a year. They taught me much more about how to work efficiently than I had ever known before. Most notable were the tricks of always wearing a huge toolbelt while working (to keep youself from running around looking for things), take time at the beginning of the job to set up a work table and a good network of extension cords and lights if needed, and keep your work area clean and organized as you go along. Also do a deep brainstorming at the beginning of each project to get as many of the materials you'll need and reduce mid-day trips to the store. Always over-buy and then take advantage of today's

generous return policies, rather than underbuying and wasting time returning to buy more parts. And keep a nice inventory of all the common things like various sizes of screws.

Everyone who develops carpentry skills surely evolves a set of tool preferences to go along with them. These represent only one man's love affair with the powerful little machines. But hopefully by at least introducing my own strategy, it might encourage some curious people to start exploring on their own.

Happy building!

The Shockingly Simple Math Behind Early Retirement

By Mr. Money Mustache

Fri, 13 Jan 2012 13:02:10 +0000

This is the blog post that shows you how to be wealthy enough to retire in ten years.

Here at Mr. Money Mustache, we talk about all sorts of fancy stuff like investment fundamentals, lifestyle changes that save money, entrepreneurial ideas that help you make money, and philosophy that allows you to make these changes a positive thing instead of a sacrifice.

In addition, the Internet presents us with retirement calculators, competing opinions from a million financial advisors and financial doomsayers, unpredictable inflation, and a wide distribution of income and spending patterns between readers.

I reviewed my own path to age-30 retirement in "A brief History of the 'Stash", then I did a hypothetical calculation using two average teacher salaries to show how long it would take them to retire in "The Race to Retirement – Revisited".

Because of this torrent of information, people tend to become overwhelmed and say things like,

"Yeah, good for you Mr. Money Mustache, but how can I possibly know when I'll have enough to retire myself, with a completely different lifestyle?"

Well, I have a surprise for you. It turns out that when it boils right down to it, your time to reach retirement depends on only *one* factor:

Your savings rate, as a percentage of your take-home pay

If you want to break it down just a bit further, your savings rate is determined entirely by these two things:

How much you take home each year

How much you can live on

While the numbers themselves are quite intuitive and easy to figure out, the relationship between these two numbers is a bit surprising.

If you are spending 100% (or more) of your income, you will *never* be prepared to retire, unless someone else is doing the saving for you (wealthy parents, social security, pension fund, etc.). So your work career will be Infinite.

If you are spending 0% of your income (you live for free somehow), and can maintain this after retirement, you can retire *right now*. So your working career can be Zero.

In between, there are some very interesting considerations. As soon as you start saving and investing your money, it starts earning money all by itself. Then the earnings on those earnings start earning their own money. It can quickly become a runaway exponential snowball of income.

As soon as this income is enough to pay for your living expenses, while leaving enough of the gains invested each year to keep up with inflation, you are ready to retire.

If you drew this "savings rate" story into a graph, it would not be a straight line, it would be nice curved exponential graph, like this:

networthify.com)

If you save a reasonable percentage of your take-home pay, like 50%, and live on the remaining 50%, you'll be Ready to Rock (aka "financially independent") in a reasonable number of years – about 16 according to this chart and a more detailed spreadsheet* I just made for myself to re-create the equation that generated the graph.

So let's take the graph above and make it even simpler. I'll make some conservative assumptions for you, and you can just focus on saving the biggest percentage of your take-home pay that you can. The table below will tell you a nice ballpark figure of how many years it will take you to become financially independent.

Assumptions:

- You can earn 5% investment returns after inflation during your saving years
- You'll live off of the "4% safe withdrawal rate" after retirement, with some flexibility in your spending during recessions.
- You want your 'Stash to last *forever*, you'll only be touching the gains, since this income may be sustaining you for seventy years or so. Just think of this assumption as a nice generous Safety Margin.

Here's how many years you will have to work for a range of possible savings rates, starting from a net worth of zero:

Savings Rate (Percent)	Working Years Until Retirement
5	66
10	51
15	43
20	37
25	32
30	28
35	25
40	22
45	19
50	17
55	14.5
60	12.5
65	10.5
70	8.5
75	7
80	5.5
85	4
90	Under 3
95	Under 2
100	Zero

It's quite amazing, especially at the less Mustachian end of the spectrum. A middle-class family with a 50k take-home pay who saves 10% of their income ($5k) is actually better than average these days. But unfortunately, "better than average" is still pretty bad, since they are on track for having to work for 51 years.

But simply cutting cable TV and a few lattes would instantly boost their savings to 15%, ***allowing them to retire 8 years earlier!!*** Are cable TV and Starbucks worth having **two income earners *each* work an extra eight years for???**

The most important thing to note is that cutting your spending rate is much more powerful than increasing your income. The reason is that every permanent drop in your spending has a double effect:

- **it increases the amount of money you have left over to save each month**
- **and it *permanently decreases* the amount you'll need every month for the rest of your life**

So your lifetime passive income goes up due to having a larger investment nest egg, *and* it more easily meets your needs, because you've developed more skill at living efficiently and thus you need less.

If want to retire within 10 years, the formula is right there in front of you – simply live on 35% of your take-home pay**, which is approximately what I did without even realizing it during my own younger years. The only reason Mustachians will remain a rare breed, is because this article will never appear in USA Today. (Or if it does, people will be too busy complaining about how it can't be done, rather than figuring out how to do it)

So keep reading, since this blog is all about making financial independence happen!

Mortgages click here
(See their mortgage disclosure here)

note – Credible has now joined the short list of approved MMM affiliates, see more info here if you are curious how I handle them.

---

*If you want to play with the (rather basic) spreadsheet I made to generate this table, you can download it in OpenOffice format (.ods) here: Retirement Savings vs. Years

** definition of take-home pay: gross income minus all taxes. Remember to add back in any 401k or other savings deductions to the paycheck you see, since these are really part of what you are "taking home" – you just happen to be saving it automatically.

Note on how to track spending: we do almost all spending using the best rewards credit card I can get my hands on, and the rest by automated bank debit (checks or cash only for things that strictly require it, like Craigslist purchases). So at the end of the year just need to review the online statements for card and bank.

Recently this has been revolutionized by apps like Personal Capital or Mint.com. Same basic idea, but it lets me see up-to-the-minute spending that is automatically categorized into nice pie charts, etc. If a figure looks surprisingly high, you can click in to see the detailed transactions in the various accounts that were added together to make that category. Quite futuristic.

Exposed! The MMM Family's 2011 Spending!

By Mr. Money Mustache

Tue, 17 Jan 2012 05:03:01 +0000

 Once a year the rubber really meets the road for the Money Mustache Family, when we have to add up the entire amount we spent on everything, and reveal it to you the readers for comparison and scorn.

Last year's Exposé had us spending a fair amount, but with bold predictions of grand reductions in the spending. To quote the old article:

> Total of Everything for 2010: $30,500
> Total excluding Mortgage interest: $26,885
> Estimate for next year (no mortgage, child in elementary school, no cruises!): $21,695

You see, 2010 was quite a while ago, so its numbers included monthly mortgage payments on our main house. In early 2011, we paid off the rest of that mortgage. Plus, Little MM graduated from preschool and we all started enjoying the benefits of public education.

But in my optimistic forecast above, I forgot to account for the mortgage interest costs from the first few months of 2011, the preschool bills from January to May, and the fact that even the full-day kindergarten class in our local school carries a tuition of $275/month. So those bloated the budget quite a bit.

As it turned out, 2011 was also a bumper year for holiday travel. We began the year by waking up in a tent on South Padre Island, and the vacations continued regularly from there. As a family, we took trips to Canada, Moab Utah, and Arizona. And as individuals, Mrs MM went on a decadent Ladies' trip to Las Vegas, while I spent an extremely fun and irresponsible week around Park City, Utah snowboarding with the Boys.

Food costs went up voluntarily as well, as the Mrs. switched to a gluten-free diet (and I partially followed her lead) leading to more eggs, vegetables, and meats. We also started buying even more organic food, which costs about 50% more in my area. I justified this only with the fact that we could truly afford it – if we still had debts or were stuck working in unpleasant jobs, I could have easily kept the food costs below last year's levels.

As a side benefit of adding the vegetables and cutting out bread (and some of the booze), however, I think we accidentally boosted our health quite a bit. Both of us seemed to reach record levels of fitness and non-flabbiness in 2011, even though we're more than double the age of when either of us last set a record (sometime around age 18). I think this whole health boost thing could make a good article in the near future, to coincide with finishing the popular Tim Ferriss book I'm reading called "the 4-hour-body". (Hint: my approach is drastically simpler and less exotic than his).

So by now, you've probably heard enough of my excuses and are sarcastically making the Tiny Violin symbol at your computer monitor as you read these justifications for an expensive lifestyle, so I will shut up and lay out the spreadsheet:

Category	2010	2011	Diff	Comments
Mortgage Interest	**3,600**	**1,500**	**(2,100)**	**2011: paid off mortgage in June**

Category	2010	2011	Diff	Comments
Property Taxes	**2,292**	**2,334**	**42**	**0.6% of home value - Gotta love the low property tax rates of the Western US.**
Groceries	**3,855**	**5,007**	**1,152**	**This increase falls entirely on my shoulders as I'm the shopper. But I am now using Costco more, which should bring it back down in 2012.**
Healthcare	**366**	**1,087**	**721**	**Mrs. M. experimented with a frivolous health care practitioner, then determined that plain old barbells were more effective at fixing all problems.**
Utilities (gas, electric, water/sewer, weekly trash, recycling)	**1,260**	**1,356**	**96**	**Lower energy consumption than last year, but city and utility rates went up.**
Wine/Beer	**269**	**226**	**(43)**	**Brewing beer at home raised consumption due to deliciousness, while cutting costs.**
Restaurants, Coffee Shop	**565**	**149**	**(416)**	**In this department, having a child who is a picky eater really pays off - no point going out to eat until he is a teenager.**
Home Renovations/Maintenance	**1,819**	**2,105**	**286**	**Renovated master bathroom this year.**

2nd half of Mega Winter Roadtrip to TX		839		gas, hotels, etc.
TOTAL	30,482	28,453	(2,029)	
TOTAL Without Mortgage	26,882	26,953	71	
Subtracting Tuition, Donations	19,843	22,437		
Subtracting travel, crossfit	14,612	16,291		
Subtracting organic/luxury food	13,340	14,639		
Subtracting home renovation expense	11,521	12,534		This is what our "no frills" living cost would be, (we'd have to move to a smaller house to go below this)

So what have we learned from this year's figures?

First of all, I was amazed at how close 2011 was to 2010. Things tend to average out over a large period of time like that and become fairly predictable.

But secondly, I was pleased to note just how much of our expenses I consider to be optional luxury spending. If you take the "total without mortgage", it looks like we're living on about $27,000 per year. But if you back out things like the $2600 of tuition that we are now done with, the $5000 of travel, the $1800 of charitable donations, and all the other things mentioned at the end, our basic life could be sustained comfortably at just over $12,000 per year. Even after we start paying private health insurance premiums in the near future ($240/month for the family as quoted in this earlier article), the bottom line could still be under $15,000.

For a 3-person household, that's well below the US definition of poverty, yet it would still let us pay for everything including property taxes and utilities on a large house, plus vehicle ownership costs on a car and a van, keeping the fleet of six bicycles in good running order, unlimited netflix movie streaming to the basement home theater.. and even my beer brewing habit!

So our lifestyle still has quite a toasty jacket of decadent fat around it, and this is important to note because we're often accused of living some sort of bare bones lifestyle that people aren't even sure if they could handle. This is just plain wrong: thirty grand plus a paid-off house is more than enough to raise a family.

So life goes on… and we're now re-motivated to try to beat these figures for next year!

How to Be Slim

By Mr. Money Mustache

Thu, 19 Jan 2012 13:00:22 +0000

 If you could sum up Mustachianism in one word, it would be "Control".

When people come into the confines of this blog from the outside world, they're shivering and worn after spending a lifetime buffeted by the storms of unfettered capitalism. They feel like their lives are out of control, and that other people are the ones deciding their fate. Their happiness, wealth, and even health are decided by the politicians, or the economy, or the corrupt corporate leaders. And to a certain extent, they are right – through the pervasive nature of marketing and political lobbying, many of the features of the modern world are designed to politely and pleasantly enslave you, so that you will work for a lifetime while agreeably handing over everything you earn to buy products and pay interest on loans.

When you embrace Mustachianism, you start to recover immediately, as you see the excess of your past lifestyle. But it is still a long journey to full freedom, because you need to get control over not only your spending, but over your desires as well. Your goal is not simply to force yourself to buy less stuff – it's to feel ultimate happiness about a whole new way of life, which just happens to involve buying less stuff.

So what we're really doing is learning to gain some control over our own minds. We do it by learning about ourselves, about our true needs as a species, and about other cultures and philosophies. These are not things that the television advertisements teach you about, because the very knowledge has the power to destroy the Sukka Consumer mindset that keeps companies like Cadillac and Tiffany and Louis Vuitton in business. But the knowledge is there, and it's old and golden, dating back thousands of years.

Once you learn that controlling your own mind is the sole key to succeeding in life, you can start applying the control to areas of life other than just becoming wealthy. You can begin breaking old destructive habits like addiction to various drugs, TV watching, and even the circular self-denial regarding food and exercise that leads most of us to be less physically fit than we would like to be.

Physical fitness may sound rather different than financial independence, but it's actually the same thing – it is control over your mind, which means it is part of Mustachianism. Because I care for you, I must ensure that you end up healthy and fit just as I must ensure that you become wealthy at a young age.

How to Be Slim:

I really like the idea of being healthy. I've enjoyed about 21 years of regular weight training and 32 years of cycling so far. I'm not one of those buff musclemen you see in front of the college bars, but I have plenty of secret inner health that keeps me going in the form of extra energy, resistance to sickness and injury, and confidence in the face of hardship.

So when I see other people my age who have already lost their ability to walk or become dependent on heart drugs, just because of their earlier food and exercise behavior, I am very curious about the huge mental battle they surely endured as they slipped down that path.

Doing some research on the matter, it seems that there are two major factors that are causing the massive fat gain in modern society today:

- Lack of understanding of what even constitutes good diet and exercise (people thinking it is fine to drink Coke or have a day where the only exercise involves walking to and from a car, etc.)
- Psychological problems with resisting the urge to do things they know are bad for them (binge eating, exercise avoidance)

I try not to rant about these things too much, because I know I can't see the world through the same lens as someone with these problems. But I did recently come across a great BBC series that addresses the problem in a very smart and educational manner. Check out all six of the ten-minute parts on YouTube when you get a chance someday:

BBC the Truth about Food – How to be Slim

Here are my thoughts on the show, in case you want to compare notes:

It's a simple and catchy documentary, with good music and some nice British wit thrown in. The most valuable part to me was how it used experiments on real people to debunk common myths that compromise people's weight loss goals:

"I'm fat because I have a slow metabolism" – wrong! Fatter people actually tend to have *faster* metabolisms, because their bodies are working hard to maintain the extra tissue and pump blood through the constricted blood vessels. In most cases, overweight people simply eat more due to higher appetite, without realizing it. The key is to find ways to take in fewer calories, without feeling like you are starving yourself. It's addressed in the documentary, but I'll give you a hint: eat more protein and cut out bread if you need to lose fat!

"Calories consumed are always digested fully" – surprisingly, foods that are high in calcium tend to block digestion of fats that are in the stomach at the same time. In the show, test subjects eat a variety of diets, and save their own dung in plastic bins for later analysis. Then attractive Danish women meticulously processed and burned the logs, finding much more undigested fat in the output of the test subjects who ate low-fat yogurt as a calcium supplement. Danish scientists theorize that the calcium causes the fat to bind into a less digestible substance in your stomach, so it ends up getting excreted.

This may explain why I lost fat when I switched my typical breakfast from cereal and whole-wheat toast to a higher fat (and calcium) one including almonds, cheddar cheese and fried eggs. The higher protein of this breakfast also probably reduces my urge to snack throughout the morning (I was formerly famous for the size of my "Second Breakfast").

"Portion size affects how much we eat" – true: studies revealed that when you double the portion size given to an unsuspecting test subject, he'll tend to eat about 45% more.

"Keep a food diary" – it really works. Just whip out your phone and snap a picture of everything you eat, just before you eat it. The mere act of becoming conscious enough to record your eating, makes you much more likely to eat well and avoid frivolous snacks like oreos and nachos in front of the football game.

I'll also throw in something from my own set of tricks:

"Learn to appreciate mild hunger" – it's an unusual feeling for a rich-world person, but once you get used to it, having a slight craving in your tummy can make you feel invigorated and warriorlike. When you are really hungry, eat a good meal. But if you're just slightly hungry, imagine that your body has moved its suction tube from the usual "stomach" setting, over to "stored fat reserves". It is now a positive challenge to maintain this mild hunger as long as possible, because you want to keep that suction going for many hours each day. You should still strategically throw in nutrients during this stage, like a plate of celery, cucumber, or carrots. But keep the burn going and build your hunger enjoyment skills – it can lead to a whole new level of control over your appetite, and thus you can maintain any weight you like, right down to the last half-pound.

This is not to be confused with anorexia, where an already-skinny person starves themselves into a skeleton. I'm talking about people with a visible beer belly, eating vegetables instead of ice cream for their bedtime snack – and enjoying it.

“Weightlifting is a the world’s best Fat Vacuum Cleaner” – it takes more than 4,000 calories to build a single pound of muscle. But as a beginner to weight training, a person can trigger over one pound of lean muscle gain with a single full-body workout! So to lose a pound of fat and gain a pound of muscle, you can spend about eight hours sweating on a stationary bike, or several days of mild hunger, or you can do one or two good intense sets of squats, bench presses, and bent-over barbell rows, and lose a pound of fat just like that.

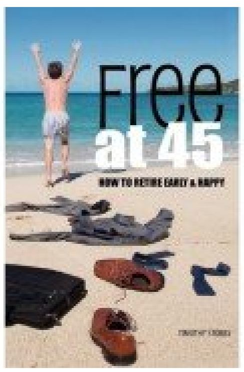
So to summarize **How to be slim:** watch the documentary and apply the principles to your own eating. Take up very easy weightlifting at home. It will happen quickly, once you can control your mind enough to keep these activities happening without giving up! If you stumble on this quest, realize the problem is entirely in your mind, and just keep working on taming that old noodle.

How have YOU tamed the natural human natural tendency to ignore physical fitness – or struggled to do so?

Book Review: Free at 45 by Canadian Dream (Timothy Stobbs)

By Mr. Money Mustache

Sat, 21 Jan 2012 22:16:02 +0000



Imagine an alternate version of Mr. Money Mustache. What if I had suppressed some of my profanity, become just slightly less hardcore in my frugality techniques, and moved to Western Canada instead of the Western US? Who would I be?

You may already be aware of the real-world simulation that exists to model this situation, his name is Timothy Stobbs, and he is the author of the blog [Canadian Dream: Free at 45](), and the book [Free at 45 : How to Retire Early and Happy]().

I had the pleasure of reading this book during my recent vacation and was pleased to note how well it had been put together. Since it's the Weekend Edition and I'm way behind on my book review program, I thought I'd share a quick review of the book with you right now.

About the Author: I came across Tim and the Canadian Dream blog shortly after MMM was born. Maybe the connection was through Early Retirement Extreme, or maybe somewhere else. But it turns out that somehow, all of us small-time financial bloggers end up getting to know each other. Eventually we will all start holding regular meetings to play poker and smoke cigars in executive boardrooms while wearing 1920s hats, but we are not yet powerful enough for this.

From the wisdom of his blog and his book, and the concept of retiring at 45, I had assumed that Tim was older than me, like 43. But the book says he was born in 1978 – just a kid! This makes the mature perspective even more impressive. Watch this guy, he will surely become quite a sage with even more age.

So on to the book.

Free at 45 addresses early retirement from a different perspective than many of the most popular books. First of all, it does not set an age limit on the activity. It is a turnoff to me when books assume people will be done raising children and starting to experience physical decline when they retire. I like the idea of leaving the door open to any age of retirement, and this book does that.

Secondly, the book maintains a focus on *understanding happiness* rather than replacing most of your pre-retirement income. There are hints of the concepts of hedonic adaptation and stoicism in some of the happiness chapters, even without explicit reference to the terms. These things are the key to the whole deal: financial independence works much better with a free mind, rather than one that has chained itself to high consumption as a substitute for understanding actual human happiness. Chapter four, entitled "What we Need" is particularly nice in this area, describing the hierarchy of needs as described by Chilean economist Manfred Max-Neef:

Sustenance (food and water)
Protection (safety and shelter)
Affection (love and friendship)
Understanding (making sense of life)
Participation(being part of a social process)
Leisure (time to reflect on things, daydream, and relax)
Creation (making things)
Identity (knowing who you are)
Freedom (choosing for oneself)

When writing the book, Tim did something I have never thought of doing myself: He interviewed actual retirees. Then he gathered their perspectives and advice along with his own experiences when baking them into a book. That's a good strategy, and it leads to a more flexible message than Mr. Money Mustache's strategy of just telling you about his own early retirement experiences. I just may be cribbing from this idea myself in the articles to come.

Tim and I do have our strategic differences regarding how much frugality is ideal, which one could have already predicted by comparing our retirement ages.

In the book, there is a graph from a US study suggesting that the happiness vs. money curve peaks at an annual income (and spending) level of about $75,000. I'd suggest this is a bad spending number to shoot for because it represents the average result of a population of people with absolutely no Mustachian training. The amount of money required for peak happiness drops rapidly as your Badassity increases.

Another area of the book that made my Mustache bristle just slightly was the talk of "extreme" early retirement. To paraphrase "Some people choose to retire extremely early, which might require extremely low annual spending such as $24,000 per year. But you can kiss the typical North American lifestyle goodbye if you make this choice". If you review my lifestyle from the 2011 spending article, you can see that I have certainly not kissed very many material things goodbye – at least not when measured by factors like the quality and size of my house or the food, health, education, and travel that the MMM family enjoys. Similarly, the idea of retiring while you still have young kids was treated with a certain amount of fear – another taboo I have enjoyed breaking.

On the "Wholeheartedly Agree" side, I enjoyed the second half of the book's simple presentation of the technical details. How to start by correctly assuming that your retirement spending should have nothing to do with your income level – earning more does not make you *need more* of anything to be happy. How to calculate investment returns and passive income requirements. How to account for special outlays like university assistance for children or extra travel. He even nicely described one of my own longstanding beliefs, that frugal people are partially immune to inflation because we watch the prices of things as the years pass, and are willing to adjust our lifestyle as needed to avoid getting suckered. (Oil prices rise faster than food prices? Spend more time cooking and less time traveling! Opposite thing happens? Reverse the strategy!).

He also covers a bit about understanding risk so you don't get suckered into spending unnecessarily out of fear. "Safety is an expensive illusion" is one sagely quotation in this area. In many cases when you do the math, it works out much better to take a risk than to pay to protect yourself against the worst possible case of an unlikely event. (Life insurance for a two-earner family strikes me as one perfect example).

I also enjoyed the Canadian-ness of the book. It is refreshing to read a book where the author is *not* obsessed with health insurance. In Canada, you take care of your own health, and the society takes care of any medical bills. And it's all done at *about half the cost* per capita of what we spend here in the US. It's a wonderful thing and we should copy it to the best of our ability. It is also nice to hear about Canada-specific issues like the TFSA, RRSP, and of course litres, kilometres, and extremely cold winters.

This will surely boost the appeal for Canadian readers, since they are often stuck reading US-based publications (like MMM itself) and then mentally adapting the advice to their own country.

The book is casual and non-scientific, much like the writing you would find in a good blog. Some might even say the presentation is *too* casual and concise, but this is actually a positive factor in my opinion, because frugality and financial independence are more about attitude than science. In the modern world of publishing, we are all free to write and publish our own books, and the world is a richer place because of it.

So, thanks again Tim for sharing your book with me and with the world. If a Money Mustache Manual ever comes out someday, I'll be sure to return the favour ;-)

Introducing the ¡Random! Button

By Mr. Money Mustache

Sun, 22 Jan 2012 18:04:11 +0000

 Hey, what's that new button at the top of the web page?

A Random Article Generator, courtesy of our technical wizard Mrs. Money Mustache. Thanks Mrs. M!

Since this blog has grown into quite a behemoth over time (170 articles so far), the newer readers have only seen the most recent ones.

Some have started from the beginning and are embracing the challenge of catching up so they can earn the title of Senior Mustachian and add a Mustache to their icon in the comments section.

But not everyone has that kind of time on their hands. For those people, the ¡Random! button is just the ticket. Click it and get a randomly selected blast from the past. If it seems like a boring or irrelevant one to you, just flush it away and try again with another click on the button.

The feature is especially useful for office procrastinators, who have to deal with a five-day-per-week working schedule, and are disappointed that MMM articles usually only come out two or three times a week. How can they get their fix? Sure there are a thousand other personal finance sites on the web, but they don't have any punching or swearing!

The most avid user of this feature may be Mr. Money Mustache himself, as I go back and nostalgically read some of my old shit in order to have a chuckle, then notice various embarrassing mistakes and rewrite portions to be more up-to-date. Over time it should be quite a nice feature, and I very much appreciate the addition.

Gaming the System with Rewards Credit Cards

By Mr. Money Mustache

Mon, 23 Jan 2012 13:39:28 +0000

I've noticed a trend among financial bloggers recently. People have started playing around with high-reward credit cards for fun and profit. Signing up for them in bulk, scooping the signing bonuses, strategically using the good ones, and cancelling the duds.

Now, I'm no novice to the idea of a cash back credit card: I used a REI Visa from 1999-2006 that yielded 1% cash back on all purchases, which added to several hundred dollars each year. In 2006, I switched to a Travelocity American Express that doubles the reward, giving the equivalent of 2% back on most purchases, and 10% back on travel. The only hitch is that the rebate can only be applied to travel purchases booked through Travelocity (air, hotel, car rental). This wouldn't work for everyone, but it works for us since we travel at least once or twice each year.

Sometime around 2006, when interest rates were high and yet credit was still loose, Chase started sending me checks for my business card that could be used to pay any bill – and they were offering a 0% annual percentage rate. After reading the fine print, I saw that the conditions were favorable. So I used one of those checks to max out the card's $50,000 credit limit, and used the proceeds to pay down a construction loan which had been charging me 7%. This allowed me to pay the much better rate of Zero percent for one year instead. Meticulously noting the payment deadlines, I played it carefully and paid it off on time, saving several thousand dollars in interest.

Today, the credit card companies still send similar checks, but they now have much sneakier conditions like "0% APR for one year!" (except a fee of $10 or 3% of the balance, *whichever is greater*). Excuse me, but that's a 3% APR, about the same as my existing home equity line of credit. Trying to mislead customers like that is a huge FAIL and should be illegal. So I now mutter a few swear words at the bank as I shuttle each of these offers from the mailbox to the document shredder.

But this year, I've noticed another opportunity opening up: credit cards that pay you an absolute shitload of money to sign up.

In the olden days, people would sign up for a card for something silly like a t-shirt or a little clock radio. The banks surely had a good laugh, since on average each new customer yielded thousands of dollars of profit for them – through transaction fees paid by stores, and through charging people hilariously high interest rates for short-term loans, which they miraculously paid willingly. They built an army of slaves, paying 18% interest plus various ridiculous surcharges and fees, on money that was really worth somewhere between 3-7%.

Slowly, capitalism has escalated the battle and the card issuers are being forced to compete for slaves. They do this by offering an ever-increasing share of profits back to the consumers. Now it has reached the point where you'd be a fool to sign up for any card offering less than a $100 reward for joining, and some will pay $400-$500. As far as I can tell from reading the user agreements, there is no unusual downside to these cards – there is no annual fee and the cash back and benefits are competitive with older cards.

One friend of mine makes quite a game of this, keeping a boquet of 14 active cards in a special folder and cranking all sorts of "manufactured spending" through them. He also works the Swagbucks system and various other coupons and gift cards. But this is too much of a job for a retired man like me. If I'm going to take action on a consumer deal where I am effectively doing battle with a clever demon who is trying to fool me, it had better pay me several hundred dollars, and take only a small number of hours of total work.

So, motivated by the idea of sharing the story with YOU, I used myself as a guinea pig and signed up for a Chase Ink Business card (pictured above) that came in the mail, directed to my business name. The card was offering a $400 sign-up bonus. The tale below describes the experience:

I applied online, using the web address specified in the paper mailing, including a specialized offer code. This went smoothly, other than some brain-dead features in the online application page, like initially rejecting my business's tax ID number because I included the hyphen that the government uses when issuing the number. (*Hint to Chase bank programmers: Parse the fucking character string and remove the hyphen yourself instead of rejecting the whole application and pissing off the user!*)

The card came within a week, with an $8000 credit line. Not the biggest account in the world, but still plenty of spending room for my little construction business. There was the usual sticker on the front telling me to "call to activate your new card!".

When I called, the automated system asked me to enter the last four digits of my card, so I did. I was expecting the system to finish off by asking for my zipcode and then leting me go, but instead the voice announced "Please hold on, we are transferring you to one of our business specialists".

Uh-oh. I didn't ask for a "Business Specialist". Is there a problem? You don't need a human involved to activate a credit card, unless there is a glitch in your account, or some fishy sales pitch coming up.

Within a minute I was connected to the Specialist. She engaged me in some unnecessary questioning and chitchat:

"Welcome to Chase Business Services, my name is Charisse and I do hope I can provide exceptional service for you and blah blah blah may I ask why you decided to choose the Chase Ink Business card?"

“Because of the $400 sign-up bonus.”

“Did you already have a business card before choosing us? If so, why did you choose this new one?”

“Yes I did have one, but I figured this one offers the same 1% cash back as my old business card, with the added benefit of the bonus.”

“Oh, honey, this is much better than a 1% card – it offers 5% back on office supplies, 2% on gas, and blah blah blah”

I accidentally laughed out loud, because she had just called me “honey”, but I pulled it together and explained that I don’t buy a significant amount of office supplies or gas for my business, so the card is effectively a 1% card to me.

“Are you aware that we have other cards that might meet your needs better?”

“Yes, I am aware, but I thought I’d start with this card and see how it goes [*and scoop another $400 bonus for that card, I figured to myself*], then call you back later for more advice. Also, I’m a part-time financial writer and I specifically wanted to review this card for my readers”.

That last comment seemed to speed things up considerably, so she thanked me and let me off the hook with a new card pre-loaded with 40,000 bonus points – redeemable for $400 in cash at some unspecified time after your first purchase*.

Then I logged in to chase.com, being sure to set up a full monthly automatic payment to avoid any risk of incurring interest charges. I noted that the default was set to “minimum payment” which would obviously lead to disaster. Another mark on the “credit companies are evil and sneaky” scorecard.

I Checked the rewards balance – nothing there yet of course, since I have not even made my first purchase. But it will come, oh yes, I am looking forward to it with a small amount of glee.

This is a pretty long description of a fairly mundane transaction. But it does represent a significant source of sneaky income for someone with time on their hands and a desire to accelerate their savings. Mike's earnings were equal to about 10% of my family's total 2011 spending. And I actually just cashed in $100 from my previous business card before being tempted by this offer. So Mr. Money Mustache is now up Five Hundred Bucks as well. Thus, while gaming the credit card system may not be fun or educational after the first card or two, it can be quite profitable when calculated on an hourly basis.

Ethically, I view it as a small win for the forces of good over evil, since I am transferring money out of a big bank's profit stream, and into mine. And I'm reducing the profitability of this very bank practice of luring victims in with initial cash, which may decrease its prevalence over time.

Three warnings about this activity:

- It will probably cause temporary dips to your credit rating, since you are triggering inquiries on your account. But by eventually cancelling any unneeded temporary cards, and being sure to keep your oldest card active, you should still end up with a continually increasing credit score. I don't care about my own credit score in the short term, since I have no borrowing planned. In the long run, however, I do want to keep it up in the 800s in case I ever want financing on a future house or investment.
- Also, I don't recommend credit cards at all to anyone who ever finds the need to run a balance and actually pay interest. They are too dangerous and expensive to use as a source of borrowing.
- Finally, be sure to log in or call and opt out of all possible marketing from the credit card company within 30 days of getting any new card. They make money by selling your name to other bad guys, and opting out really does help. Despite having several credit cards, businesses, homes, cars and other consumer things, I get virtually no junk mail from outside companies – just occasional junk from the banks I currently do business with. With no newspaper or magazine subscriptions coming to my house, I find this junk mail to be an essential resource for starting campfires.

In the end, this new card gave me an excuse for an article and will pay for a good chunk of my upcoming snowboarding trip to Lake Tahoe. But this tactic is not for everyone – just the hackers at heart. I told Mrs. Money Mustache about my $500 total windfall so far, and this is what she said,

> "I don't want to know anything about all these silly cards – just keep me in the dark and let me know how much money we made once they are DEACTIVATED".

Smart woman, but I'll still have a chuckle when I deposit that $400 into my account.

Update: On February 12th, I logged on to check my balance and found that the rewards were now available. $403 smackeroos, which includes the signing bonus and the standard reward on one month's worth of business expenses. I requested a check immediately, so it's now in the mail.

Update 2: On February 23rd, I received the $403 check! The money is real!! So I put it back into the mail for deposit into my ING direct bank account (I could also throw it into my local bank machine, but the weather was crappy today so I decided to let the mailman do the work). Total time from application to Monetary Consumation was about one month – not bad at all.

Update 3: Do you want to game the system yourself while possibly supporting the MMM blog? You can now browse through a list of referral links I have started collecting to high-rewards credit cards, and see if any suit your fancy, by looking at the **Credit Cards page** I have set up. Just be careful out there – avoid annual fees, don't do balance transfers unless there is no fee, and NEVER pay interest on a credit card balance!

*You can also redeem 25,000 points for a plane ticket worth up to $335, which could be a way of expanding bang for the buck, as long as their online redemption center shows the same flights at the same prices as the airlines.

Reader Case Study: Student Loans or Saving for a Home?

By Mr. Money Mustache

Wed, 25 Jan 2012 13:00:08 +0000

 Hey! It’s time for a Reader Case Study!

I almost forgot about this cherished category of posts, partly because my MMM contact email address stopped forwarding way back on January 10th. “Ahh, this is relaxing”, I thought, “I guess nobody has any questions for me these days!”.

Mrs. Money Mustache laughed at my naivete. I fixed the forwarding system on the web host, and FLOOD, 100 personal questions and comments came in to engulf me. (My apologies, by the way, to everyone who emailed me during the past two weeks and was ignored).

So it’s time to get back to work and answer some questions. Today’s comes from a US couple with young kids, just getting started in their careers.

> Hey MMM –
>
> Did it ever occur to you that Mr. Money Mustache and Sherlock Holmes have a lot in common? I just finished the Adventures and

Memoirs series and couldn't help but draw some parallels. Like MMM, Holmes appears to be an early retiree who does the kind of work that interests him most. He doesn't even have one car, and he pretty much just does whatever the heck he wants to (granted, Holmes is a bachelor), and it happens to reward him financially. But besides that, he's a detective. And I kind of think of MMM as a debt-fighting detective who goes around sleuthing to stop crimes of financial insanity.

THE FACTS
I'm a recovering law student, still looking for a "real" job while working as a law clerk, and she's a full-time mom who does some contract editing work in the evenings when the kids are sleeping. Until recently, we took in around $2000 a month, and we spent around $2000. Due to some cuts in our spending (like me biking to work, a borrowed bike trailer for other errands, and other applications of fiscally sound principals) we are planning to squirrel away at least $500 a month until I get a job and our income increases dramatically. Also, because we have two kids, we'll get at least $4000 from Uncle Sam at tax time (Earned Income + Additional Child tax credits).

Unfortunately, we're in the hole as far as net worth goes. No consumer debt, but we have student loans totaling about $52,000. Ouch. In terms of assets, we have about $6,000 in cash, $14,000 in retirement accounts, two cars* we're going to sell (worth about $2500 apiece), and our actual family car, a recently purchased '02 Honda Accord (we paid $4000 cash for it).

The student loans are currently in a "deferred" status, which means that there are no payments actually due. In addition, most of them are not accruing any interest during deferment. There is one exception: one of the loans, worth $4700, is currently accruing interest even as I write this e-mail at a rate of 6.8%. (The other loans, once the deferment period ends, will accrue at rates ranging from 4.75% to 6.8%.)

THE DILEMMA
Our question is whether to pay down the student loans as fast as

possible, or try to build up cash as fast as possible so we can be in a better position to buy a house?

Of course we are eager to pay off these debts as soon as possible. Although federal student loans in the U.S. have fairly agreeable terms as loans go (like deferment when you become unemployed, income-sensitive repayment, loan forgiveness in certain careers, etc.) it's still not something we want to keep around in our lives for too long.

But we've also been interested in setting aside some money each month into a "house fund," with the idea that we will probably be buying a house at some point in our life, and we really want to have at least 20% to put down on it.

Waiting until the student loan is paid off before incurring a mortgage has a sensible ring to it, but at the same time, I've been looking into renting vs. buying in some of the areas where I plan to work, and a $200K mortgage at 3% interest would actually come in quite a bit lower in terms of monthly expenses than a comparable rental. Plus there just aren't many rentals in some of these markets.

So let's say we have $500 to allocate somewhere every month, plus a one-time windfall from the government of about $4000. How much of that would you put towards student loans (especially the one that's actively accruing interest at this very moment) and how much would you squirrel away into a savings account?

Thank you in advance for any thoughts.

MMM Responds:

Dear Sir,

Congratulations! You are on a good path with low expenses, and I'm glad to see so much thought being put into the next step. In your situation, most people would just immediately go out and finance two minivans while simultaneously buying a house with 0% down and furnishing it with credit cards.

The first step is definitely paying off the currently-active student loan. 6.7% is a high interest rate by today's standards, and you'll never beat the guaranteed return you get by paying if off right now. Take some of your cash and wipe it out. Hooray!

Your car situation sounds excellent as soon as you sell off the two spares – one car, paid off, reasonably efficient and reliable. No need for improvement there.

Your next step depends on how those student loans shape up. For now, if they are not accruing interest, there is no need to pay them. But as soon as they do, you'll want them gone, because the interest rates are higher than those you'd incur with a mortgage.

If I were in your situation, once I got a job offer I'd put top priority on finding an apartment or home rental within non-driving distance to work. It can be a low-cost place for now – remember, you currently have a negative net worth which means it's emergency time rather than luxury time. Pay off the high-interest loans completely and ignore home downpayment savings for now.

If you try to simultaneously save for the house, you're effectively paying 6.7% interest for the privilege of building up a downpayment in a 0.9% savings account. That's not good math. Even if you succeed and end up getting a house this way, you'll then have a mortgage, property taxes, maintenance and upgrade costs, student loan payments, AND a collection of empty rooms that are screaming for furniture, appliances, curtains, bedsheets, and other treats. All with a negative net worth.

On the other hand, if you eliminate the debt FIRST, your wealth will start to climb much more quickly. You'll save a compounding amount of interest fees each month. Then once the loans are paid off, you'll drop your monthly costs significantly. During this whole time, you will be living in a small apartment or rental house which will remind you every day of your mission: saving for the house. Because of this, you'll lead an efficient lifestyle and the 20% downpayment will fly into your bank account very quickly.

With a good downpayment and no other debts, you'll qualify for a better mortgage with lower rates and a higher ceiling. This will give you both mental and financial leverage when you eventually do your house shopping, which will help you get a great place. You'll begin your new homeowning life just as your law career starts to take off, allowing you to rapidly amass a life-sustaining 'stash. This freedom from debt will also help you avoid the Lawyer Trap, where junior staff feel pressured to work ungodly hours to pad a senior partner's paycheck. With a strong financial position, you'll have the confidence to call your own shots and spend the right amount of time with your family.

Case closed, and congratulations again!

The Foreclosure Project: Final Numbers and Pictures are In!

By Mr. Money Mustache

Fri, 27 Jan 2012 13:18:55 +0000

 the Foreclosure Project.

In the previous article, I mentioned that we had rushed to finish the interior work as the house got snapped up by an eager family for a late December move-in. I posted some hasty photos from the few I had taken, and you readers requested more pictures and final details on the numbers regarding time and money spent for the renovation. So let's start with the numbers:

Materials:
Estimated Materials : $5158 + paint and misc ($2k) = $7158
Actual Materials: **$6995**

Labor:

My portion (carpentry, plumbing, electrical, roofing, misc.):
Estimated Work Hours : 244   Actual Work Hours: **224**
Work from my partner in the project: **200 hours**
Additional labor paid to others: **$2058**

Counting the primary partner hours at $35 as we did in the budget, this adds to a total renovation cost of: **$24593**

Wow, that IS remarkably close to the $25,000 I originally estimated before even buying the house. But there's an upside to this – it includes lots of work we consciously threw in once we got going and decided to make the place nicer than originally planned. For example, at least $1000 went into jazzing up the front porch and its roof, I cut out cabinets and did plumbing to allow a new dishwasher, and we did more fancy bits of trim and woodwork around doors and inside closets than originally planned.

I feel that going for this slightly higher level of quality is what allowed the house to rent for $1200/month instead of $1100. When you consider the extra $1200 per year of rental income, forever, it actually justifies a $12,000 investment (assuming you want a 10% annual return on your investment). In this case, we got that extra boost by only spending a few thousand extra.

Just to review a few more of the key figures:

Original purchase price of the house: **$113,500**
(price was originally 115k, but at the last minute we negotiated an additional $1500 off the price for roof/plumbing repair)

Appraisal, lender, inspection, closing fees, etc: **$0** <- a huge benefit of paying cash for a house.

Renovations: **$24,593**
Utilities and taxes during renovation stage: $500
Total Cost After Upgrades: **$138,593**

Annual Property taxes and insurance: $1600
Allowance for Maintenance: $500

Annual Rent @1200/month: $14,400
Net annual cashflow: **$12,300**

Cap rate: $12,300/$138,593 = **8.9%**

That's only a moderate cap rate by bigtime landlord standards, but it is exceptional for a single family residence in this area.

Apartment buildings and multiplexes are more profitable on the surface. But the Single Family house has certain advantages as well: maintenance and hassle is low as a percentage of the income, because you only deal with one person for this $1200 per month, while a landlord of $600 apartments has to manage two tenants.

If you think of it from an early retirement perspective, you can raise a family comfortably with just two or three rental houses like the one described in this article. That implies a nice, full, Early Retirement, on somewhere between $277,000 and $416,000 of savings. In exchange, you just have to manage 2-3 properties. They are effectively creating an 8.9% "safe withdrawal rate" instead of the industry-standard 4% that you use when planning a stock portfolio. (depending on your area, you may have to discount a certain percentage for vacancy, although I always shoot for 100% occupancy myself).

Another advantage of the SFR is that its *underlying value* can rise even faster than its rental income, in the event of a strong housing market. An apartment building is generally worth only a multiple of its rental income. A house, on the other hand, is worth whatever an emotionally-driven home buyer is willing to pay for it. With these upgrades, this house would sell for a little over $200,000 on today's market. So even after paying ourselves separately for labor, we created a profit of over $60,000 in just three months. In the future, I believe this neighborhood will continue to appreciate more quickly than the rest of my city since there's only one historic district, it is close to all of the city's best amenities, it can never expand, and most people who move here from other cities tend to choose the "old-town" area as their first choice.

Some will say that I should therefore use $200k as the cost basis when calculating the cap rate, or that we should sell the house immediately and start again on another one. Both of these are valid arguments, but in this case my friend is the owner and wants to hold onto it for future income and appreciation. (I just have an interest-earning loan against it that will be paid back to me fairly quickly).

So with all of the business out of the way, let's move on to the before and after pictures! Keep in mind when evaluating quality and fanciness that this is a high-speed and low-cost project. This work is not four-seasons-hotel-lobby quality – my only claim is that it represents a pretty thorough transformation of an entire house including lots of its hidden parts, for under $25,000 and in under ten weeks..

You can click on any image to get the full-sized version.

Note the wire barnacles, shredded roof, and sagging/rotted porch

The porch was rebuilt to have blue-stain pine columns and beadboard ceiling, as well as a galvanized roof just for some flair. Still to add: slate sides/steps

View of the back room and deck

View of back room and deck

More random wires removed, broken hot tub sold on Craigslist (!), deck stained, and of course house painted

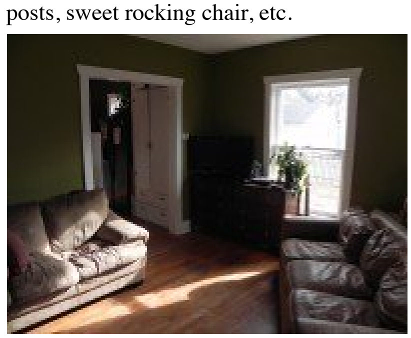
Tragic garage! Roof was slowly rotting away due to missing shingles. 1000 abandoned wasp nests plus and vines growing in rafters.

Same garage with very barebones upgrades: paint, siding (not quite done in pic), and the $4 windows from Re/Store

Old front door, complete with foreclosure notices

New front door ($20), with new trim, beadboard ceiling, nice posts, sweet rocking chair, etc.

Living room, before. Doesn't look that bad in the picture, although it had a cracked/sloped doorway to kitchen



New wider doorway with nicer trim - and straightened floors. (my friend the painter also sanded down and refinished all the wood floors)

Old kitchen countertop. Not a bad layout and somewhat quaint. But the shelves were only 13.5" from the countertop, and all components were just really shitty, especially the sink/faucet

For over sixty years, the fridge and stove sat in this ridiculous empty area across the kitchen. Somebody added a hot tub and air conditioning to this house, before they even had a place to put the package of EGGS before frying them for breakfast. INSANE!!!!

The third view of the kitchen - empty space near the window

I kept the same basic look but made new upper cabinets that fit the space better. Tiled the countertop and backsplash with virtually free recycled tiles. Changed door hardware, new sink/faucet. We also cut out one base cabinet and added a dishwasher instead, (acquired for $20!!)

Two custom-built (but very low cost) shelving units with matching tile countertops to the rescue. Along with a flat-top range from Craigslist.

We decided to keep the old pantry and just refurbish it, and the empty space was perfect for this nicer fridge.

The bathroom was by far the worst room in the house. Several ladies ran from it while holding their hands over their mouths to prevent vomiting. This picture, while taken after I had removed the old fixtures, still represents approximately how shitty it was.

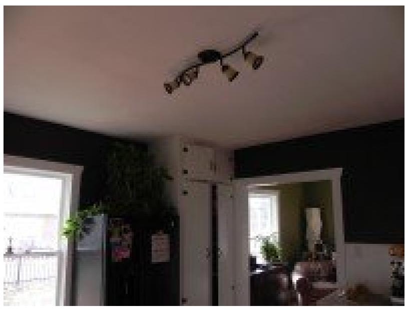
The new bathroom is quite nice, but I still don't have any great pictures of it - it was too full of towels and toiletries to photograph on this day. But here you can at least see the custom shower curtain I welded up to match the shape of the tile showerpan I had built.

Bathroom wall, with hole for new second doorway framed in

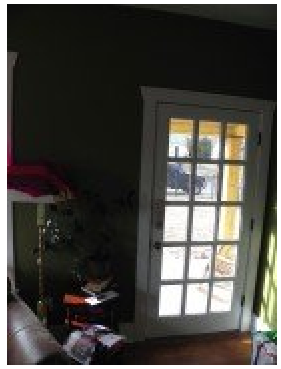
New bathroom sink and table, made out of antique sewing table found for $20 used

The Back Room - before - Laundry machines were at the North end, which was blocking a bedroom window

After: moved laundry area to the South end, opening up the bedroom window area for this handy office area just off the kitchen



Random shot of a newer light fixture. Formerly there was a peeled white ceiling fan with a single globe light bulb - for the whole kitchen! Kitchens need multiple bright light heads that you can aim at different work areas.



Random shot of the new front door, with the cozy porch beyond, surrounded by real people's stuff. Home sweet home.

I really enjoyed this project, and I will probably repeat the process when I have enough uninvested cash collected to fund a similar one myself. Before then, I may even team up with another investor* to keep the fun going in the mean time (and accelerate the cash stashing process).

** Interested in being the investor? Or perhaps you have a house in Hawaii that needs attention during the winter season? Get in touch with me through the contact button of this blog! It's just an off-the-cuff idea at this point, but you never know what good things come into being when you start throwing around inspirational business ideas with new people.*

Epilogue, 1.2 years later: *Wow, that little note at the bottom of this article did lead to lots of fun. I heard from at least a dozen interested investors (although I in the end I decided only to invest alone for my own projects, I've helped a few buy their own places separately). And The Hawaii comment led to this.*

Update: Over three years have passed and this project continues to be a good memory. The house has experienced zero vacancy, no maintenance issues, and a strong local market has allowed the rental income to increase to **$1700 per month**.

Your Money Can Work Harder than You Can

By Mr. Money Mustache

Mon, 30 Jan 2012 13:00:09 +0000

 I’ve been adding up the number of hours I worked last year, just out of curiosity. The biggest burst of it took place in November and December, when I was renovating the new rental house.

Man, I sure felt like I was working hard at the time. Five days a week, for all of my available time. Designing, prying, cutting, smashing, carrying, building, tiling, climbing, crawling, bleeding, swearing, laughing, gluing, nailing, and on and on. I ate my lunches while walking around and continuing to work, and I barely had time on the weekends to catch up on real life, groceries, and cooking.

But when you add it all up, it was really only a little over 200 hours of work. At a typical solid working wage of $35 per hour (almost five times the US minimum wage), this adds up to about $7,000. It’s a good chunk of money, enough to buy a fairly new car or for a single person to live frugally for a year. So I was proud of myself doing this much work even during retirement (even though I won’t technically get paid for it until sometime this year).

But while I was doing all this real work, my old forgotten money collection was also working. My old stalwart rental house silently delivered two rent checks, yielding about $4,000 after accounting for expenses. The main house provided me with mortgage-free living, saving about $3,000 in interest payments compared to someone who had bought an equivalent house to me with no money down. Well over $1000 in dividends reinvested themselves into more shares in index funds, whose share prices also tend to appreciate over time as well. A lack of student loans, car loans, and credit card loans on the various material goods we bought over the years (and still use today) saved us another $1000 in interest expenses*. Investments made in home energy efficiency saved hundreds more.

All in all, the 'Stash, which is simply money earned in the distant past that I invested instead of spending, earned at least $9,000 during the two months, while I earned only $7,000 working my ass off. I found this quite amazing, since this is a collection of assets (the money, not the buttocks, that is) that most people consider to be "not enough to retire on".

What I realized is that it is very easy to end up with an army of dollar bills, tireless employees, that end up working much harder than you do. Mine have already almost overtaken me – to maintain my current lifestyle without any savings, I'd have to work extremely hard just to stay afloat. Even a short-term job loss would lead to disaster.

But this inequality will grow even further over time. Since we're not spending everything the 'Stash provides and are even adding to it occasionally, its earning power will tend to increase. Within 10-15 years, it will be doubling its current production, meaning I'd have to go back into Software Engineering to even keep up with it. As it grows, its output will dwarf our spending further and further, meaning the reinvestment rate will get closer and closer to 100%. By the time I'm at the standard retirement age, this Money Mustache will be producing so much income that I couldn't match it even if I took two engineering jobs and worked them simultaneously.

If I had been crazy enough to keep working to my current age and saving at the usual rate, the 'Stash would be several million dollars by now, giving off passive income of over $150k. If I continued working until age 65 and saving and reinvesting, it would be in the tens of millions, and the passive income would be over $100,000 per MONTH, inflation-adjusted. I could fund an empire of children and grandchildren who never have the pleasure of having to work for their own money, and keep them busy with private jet flights between family compounds in various countries. Which is of course the unwise path chosen by many of the world's rich people today.

What I'm talking about is pretty old news. It's the foundation of capitalism itself. But the sheer speed at which a snowball like this can form astounds even me. To me, it feels like I just finished school a few years ago. I look roughly the same I did as a 20-year-old with no savings, (save for a tiny bit of salt-n-pepa in the facial hair). I still have to show ID occasionally at the liquor store. I got the same jobs as my peers, led roughly the same lifestyle. But doot dee doo, I just skipped a few new car purchases and Apple-brand laptops and shopping mall sprees and self-imposed commutes.. nothing major, just some of the fluff – and WHOOSH – here is this sticky ball of cash now rolling along behind me, just about to run me over. How the hell did that happen so quickly?

So remember that when you're making seemingly small money decisions as a young person. You can put that $100 bill into your pipe and smoke it, or you can roll it up and stick it to the cashball that you've started pushing along. Don't be discouraged by the deceptively small size of the ball right now. The time from the first dollar bill until the time it starts out-working you is tiny, compared to your lifespan. You can roll it up now and then have it push you along nicely for your whole life, or you can take baby steps of saving for your whole life, and then have the helpful cashball appear just in time for your old age – if you are lucky.

Have a great Monday!

**Several people have written in to hassle me on this accounting method. If you think it's wrong, you just aren't thinking about it carefully enough.*

Let's use a house as an example:

If you choose to own a house, it becomes part of your lifestyle. It's an expense, and if you like having a house, it's also a benefit to you.

Now, let's say you move into a $200,000 house and you choose to borrow 100% of this house's purchase price, so you must pay interest on it. Your housing cost is now $10,000 per year. You could choose to pay off the loan with some of your savings, in which case those savings are now providing $10,000 per year of annual "return" to you. Or you could invest the savings elsewhere, but that is irrelevant – all that matters in this case is that if you use the money to pay off the house, it is providing $10,000 of value to you.

Perhaps you could invest it somewhere and make $15,000 per year. Fine. Now your cash is earning $15,000 per year, and mine is earning $10,000. That doesn't make any difference to the fact that mine is still earning $10,000, as described in this article.

Now, you can repeat this process for everything you choose to have in your life. If you add a car to your life, it is an expense. Will you borrow it, and pay $1000 per year in interest, or will you use cash, and accept the interest savings as an acceptable return on your investment?

Every material thing in your lifstyle comes with a cost. You can borrow the money to buy it, or you can pay for it outright.

Every bit of money you own carries the potential to generate an annual return. Whether you use this money for investments, or paying for the material parts of your lifestyle, or a mixture of the two, is irrelevant. The money is still working for you.

Of course, if you have so many material things that they tie up ALL of your money, you have a highly material lifestyle and no cash left over for groceries. I could live in a million-dollar house with no mortgage. The money would still be "working" for me by saving me $50,000 in mortgage payments per year. But I'd still get into trouble, because I'd be living a lifestyle with $50,000 per year housing costs, while my assets only did $50,000 of work for me per year.

This is not funny accounting – it's the CORRECT way to think about money and lifestyle expenditures. If you don't understand it, you need to keep thinking about it until you do. Only at that point will you be able to *rationally make the tradeoff between owning stuff, owning investments, and deciding how to use debt.*

Mr. Money Mustache's Big Mistake

By Mr. Money Mustache

Wed, 01 Feb 2012 13:00:30 +0000

"The problem with Mr. Money Mustache", some people say, *"is that he has led this blessed and privileged life where nothing ever went wrong for him! He never makes any mistakes, and that's just not the case for most people."*

I can see why you might think that, since I tend to write to you about only positive things. It's a habit I picked up about twenty years ago after reading The Magic of Thinking Big, and I'll never let it go. People who know me will notice that I'll never say "I'm coming down with an awful cold". Instead it will be something like "I'm just recovering from a bit of a cold, it should be on its way out by tomorrow morning". You simply get no benefit from telling others about the problems in your life. At the borderline between useful and non-useful things to talk about, you might mention a life problem you're working on solving, while talking about what you've accomplished so far in your plan to fix it.

But since you asked, I think it would be educational to share the story of The Biggest Fucking Mistake I've Ever Made In My Entire Life. Just to show how even a BFM doesn't have to ruin your life, and indeed you will almost certainly come out happier in the end after you get through it. So pull a log up to the campfire and start roasting a marshmallow – because this is a scary one.

It was the year 2004. I was happily working as a software engineer, and my new wife and I were living a great life. We had no kids, great friends, great jobs and we were busily 'stashing and just a couple of years from financial independence.

"This is fantastic", I thought, "What will I do next, after finishing my regular working career?"

One day, while passing the time between flights in an airport bookstore, I picked up a discounted copy of "Rich Dad, Poor Dad", by Robert Kiyosaki. Despite the more recent widespread criticisms of that book and its author, at the time the book screamed to me, "You should start your own business and lead a big exciting businessman life!!"

To me, starting my own business meant turning my most cherished activity into a post-retirement job, which of course meant building houses. I already knew a few custom house builders at the time, and they were all doing great business here in Boulder County buying empty lots in good locations, and building luxurious but not overly large houses on them. When I reviewed their numbers and toured their houses, the work and the profits looked great, so I decided to jump in as well.

I happened to have a very good friend at the time, let's call him Dean. Dean and I had met five years earlier, when we randomly ended up as cube neighbors in a high-tech company in Boulder. We had both come to Colorado at the same time in the fall of 1999. He was just off the plane from San Francisco and I had arrived from Canada. We had a good run together in that little company, working on innovative projects together and mocking the more Dilbertesque aspects of our company's senior management. We bought houses at the same time and helped each other with the renovations and hosted alternating parties almost every weekend.

Even after I moved on from the Dilbert company and started a more serious engineering job in the same city, we remained close friends. We hiked, biked, and snowboarded together. And we both had entrepreneurial dreams, inventing dozens of hypothetical plans together and working out sketches of the business ideas.

So it was natural that when I decided it was time to start a house building company, that I'd invite my best Colorado friend to be a partner. I thought he would do great, because he had a beat-the-system attitude that I valued. He was the one who taught me that you can argue with credit card companies to have charges removed, that you can buy whatever you want at the hardware store and just return whatever doesn't work out, and that you could call the town council and ask to have a rule changed instead of just obeying it.

Of course, looking back I can also see the obvious warning signs that I was blind to at the time: he was also the one that taught me you can slack off at work, and still get paid the same amount. He used to award himself extra vacation days as "comp time", even while his regular working hours were 9:30am – 4:30pm with plenty of time for personal phone calls and web surfing in between. He even told me of some youthful moneymaking adventures at earlier jobs that seemed to surpass anything I had attempted in my own non-innocent childhood.

"Wow, that sounds kind of illegal", I thought at the time, but I figured it was many years in the past and it was just a typical young person's testing of society's boundaries. And he justified it all with such intellectual and socially-responsible explanations. He did volunteer work and helped out friends in need. Wiser readers will at this point recognize the signs of a shifty and sociopathic character, which I now see in retrospect.

But at the time, I was just star-struck, as we took two-hour lunches to eat Jamaican food on sunny Boulder restaurant patios and play basketball with our coworkers in the court behind the building, in the time I'd normally assume we should be writing software.

So when I presented my new House Building Company idea to this adventurous guy, he immediately latched onto the idea and the planning took off. He persuaded the owner of perhaps the hottest New Urban Design neighborhood in the country to sell us two plots of land despite being unproven new builders. I negotiated with one of the best and most well-known architects in Colorado to take us on as a customer at a drastically reduced rate. The owner of the firm had a soft spot for the young fresh-faced businessman with the same goals as he had – to build housing that was Human and Earth-friendly instead of ostentatious. We teamed up with a sagely old builder as a mentor to watch over us as we built the first house, to prevent newbie mistakes. We were on a roll as we signed on subcontractors to help out, selling the dream to everyone and pre-selling the house before we had even finished building it.

But in the background, little warning signs were continuing to pop up. Our financial agreement was that I'd bankroll the whole downpayment for the project, while my friend would only put in the $20,000 or so he happened to have sitting around. We worked on arrangements for compensating me for my increased risk in the project, until he came up with this "brilliant" idea:

> *"Well what about this, if the company loses money, we'll share the losses equally, so you are NOT at any more risk than me. I've got my 401k as a backup plan, and I'll cash it out in the worst case if we get into hot water"*.
>
> *"Good idea"*, I thought, *"Now we can just be equal partners! I sure feel good not being the only one at risk"*.

Ahh, naive little Younger Money Mustache. Trusting to a fault. I never thought my best friend would go back on his word – we'd done everything together for the last half decade!

So the project went on. I put in a heap of my own cash and also took out a $90,000 line of credit on my house. I poured every paycheck into that company for a year, to minimize the outstanding balance on the high-interest construction loan. "What could possibly be safer than investing in your very own company at a guaranteed return?", I thought.

One day, an email came from my friend, entitled simply "Need 17k".

It turned out he wanted to move out of the place he was renting and buy a house instead. I expressed some concern about this, since it would take his investment down to zero even while mine had now reached about $200,000. He pooh-poohed my concern, reminding me that I already owned a house, and of course it was only fair that he should be allowed to have one too.

We worked like DOGS on that construction company. Well, I did anyway. I snuck time out of my office job to answer emails and work on marketing materials. I worked every night until midnight on budgets and material selection and design ideas. I negotiated a four-day workweek from my employer and started spending every Friday building alongside with the framing crew, to learn, prevent problems, and speed the house along in any way I could. I worked on the site with a carpenter friend on weekends to get even more done.

My business partner seemed devoted at times as well. He made some good contributions throughout the project, and he was a smart and organized guy. But I couldn't help notice that he was still taking weekends off, still volunteering in local organizations, and he happened to take two trips to the Caribbean during the first year of the company. While I worked on our company's house, he worked on renovating his own new house, drawing a handy monthly salary from our company even while I made contributions to it every month.

But our success masked these problems. We sold our first project before it was even complete, for our full asking price. My own labor had cut our costs considerably, leading to a healthy profit margin. But then a long argument started about dividing the profits. I had kept track of my labor hours, and I suggested that I be paid for them at a low rate, since I had used them to reduce the cost of outside contractors. He disliked this idea, thinking that the profits should simply be split 50/50. "It's not an hours competition", he said. "We each contributed in our own way. What you brought to the company was your ability to work like a workhorse, and what I brought is strategic ability. If I make a phone call to the city that saves us $2,000 in re-zoning fees, and you do fifty hours of work that saves us $2000 in contracting fees, should you get paid more than me?".

Of course, my own phone calls, such as the one that I made to the architect that saved us $30,000 in architecture fees, and other similar efforts negotiating with subcontractors and materials suppliers, were somehow not considered equal to his own strategic brilliance.

By this point, I realized that our partnership was not meant to last, but our company still owned one more plot of land and we were already building the second house on it. The housing market was strong, and I figured we could finish it, sell it and I'd be out of this little situation. So I gritted my teeth and tried to smile.

But it happened to be the year 2006, and the US housing market was just about to take a plunge into the shitter.

The second house went up beautifully, and problem-free. My now-semi-friend did a competent job at repeating his role in organizing the contractors. And being fully retired from my day job by this point, I was able to spend every day at the site watching over things and building. Potential buyers toured the house every day and we came close to selling it several times before it was done.

Then the recession hit, and the house began a long period of sitting on the market. It was shiny and new and luxurious, with its airy, empty superinsulated rooms and cool thermal mass effortlessly battling the hot dry summer of 2007. Then its huge South-facing windows and bright halogen lighting and warm bamboo floors challenged the cold winter of 2007. So much work and care went into that place, and yet there was absolutely nobody interested in buying it. And every month we were going $3000 further into the hole.

We got desperate and rented the house out to a group of tenants who eagerly promised to buy the house very soon, as soon as their current financial problems were resolved.

Chase Bank backed out of their promise of an open-ended construction loan and insisted that we refinance into a mortgage. This would be no problem, they explained, as long as I could pay down the principal by another

$67,000 so it would be a conforming loan of $417,000. At a 7.25% interest rate.

My friend was of course grateful that I was able to come up with the $67 grand, since he was in debt from having to live on the low pay our company had given him for the past two years. I noticed, however, that he did not offer to move out of the house he had renovated for himself, or even to sell the top-of-the-line stainless steel LG appliances he had purchased for himself with money drawn from the company. His wife still worked, of course, and her former condo which was now serving as a rental house for them, was also not up on the auction block. "Her finances are separate from mine", he explained. My wife surely wished she had thought of that trick.

Tenants came and went from this house. We kept trying desperately to sell it, and dropping the price. For every showing, we had to visit the house and clean up after the tenants in hopes of having a presentable house. Every month, we split the difference between the $3,000 mortgage payment, and the $2,100 rent, in order to keep the house out of foreclosure. He reminded me often of how ethical he was to keep making these payments, despite his own financial hardships.

This went on for a little over two years, but it felt like twenty. But somehow I adapted to the "new normal" and managed to lead a happy life, focusing on raising my young son and taking on carpentry projects to help rebuild my savings. We cut our family's spending drastically and Mrs. Money Mustache increased her work schedule to increase income as a precaution as well.

Finally, in late 2009, we caught a lucky break. A wealthy US businessman who was returning from a long overseas corporate position fell in love with our house. He toured it extensively, spent hours running his eagle eyes over any potential flaws, and eventually made us a lowball offer. He was a shrewd negotiator, but given the state of the housing market at the time, his offer of $450,000 was not that far below market value (which was in turn about $200,000 below our original budgeted selling price). But after the hell we'd been through, I was ready to make a counter-offer and get the deal done.

But guess what Dean said?

“Ohmygod, guys, my accountant just told me that because I’ve taken so much out of this company, I have a negative tax basis in it. If we sell this property, I will owe over THIRTY GRAND in income taxes, and I just can’t handle that. I’ve already got 50k in credit card debt!! Since I’m a co-owner of this property, I’m not going to sign off on the sale. I think we should hold onto it for a few more years, and sell it for $650k instead. Then I will get enough share of the profit to pay my income tax bill”.

“Umm.. Buddy”, I said, “Do you realize my wife and I have over two hundred thousand lost already in this company, and you have about negative fifty, and that you have proven yourself less than faithful in coming through for the company when it is in financial need?”. “I would firmly suggest that you fuck off about your petty thirty grand, sell your LG appliances or your rental house, and let me end the personal hell that we’ve all been battling for the last several years.”.

“Well shit”, he said, “That’s just like you, MMM, always thinking everything has to be your way. I wish you could see things from something other than your own perspective. I wish you could hear yourself right now!”.

I actually recorded the three-hour conversation where he said this – our final business meeting for that company. Someday I’ll listen to it again, but for now the very idea still upsets my bowels.

To make the rest of this long story shorter, I hired a lawyer friend to apply the necessary pressure to have him sign off on the deal. Even so, the deal still required me to pay off the mortgage on this property because both of our names were on it. To accomplish this, Mr. and Mrs. Money Mustache had to scrape together **a final $409,000 in cash**, the outstanding balance on the mortgage, and pay it to Chase Bank.

Dean would still owe me over $100,000 because of the difference between in our investments in the company, but he quite confidently informed me that he did not intend to pay me back, because he was already on the verge of bankruptcy. He reminded me that if he did file for bankruptcy, his creditors would very quickly lay claim to the house we had built, because he was a part owner. My lawyer confirmed that he was right, and that I had no legal way to force him to keep his original promise of splitting the company's losses. The best we could do is get him off the property's deed to avoid further problems. Dean had an opinion on this as well:

> *"I can't sign off ownership on the house",* he explained, *"while my name is still on the mortgage. That could be disastrous for me."*

Yeah, we wouldn't want a disaster, would we?

But then an interesting thing happened. The SECOND we all signed those final papers at the title company, shutting down the home building company, wiping out the mortgage, and separating my fate from Dean's forever, I felt a weight equivalent to the entire chain of the Rocky Mountains lift instantly off of my shoulders.

Finally, the emotional damage could start to heal. During the peak of the crisis, I had lost my ability to sleep, lost my appetite, and lost 25 pounds of bodyweight over a period of just a few weeks. I could think of nothing but rage, revenge, and worry. To fight back I read several books about stress, its underlying causes, and how to deal with it. I also learned more about happiness, and started keeping a journal where I'd write about my level of worry and my goals for the next day – one day at a time, and then one week at a time. I was feeling better every day, even before the underlying problem was solved.

After the deal was done, all this preparation and research compounded with the natural relief of the situation and made me a freakishly happy man. And when I say happy, I mean jumping up and down, sprinting around the block, and then punching a punching bag while laughing out tears of joy until you collapse, happy. I've continued to be roughly this happy for the two years since then, taking a life that was already pretty good, and ending up with one that is as good as being a an immortal superhero who lives on a cloud playing a Golden Grand Piano while his best friends accompany on the bass and drums, as the entire population of Earth gathers below the cloud every evening at sunset for an all-night dance party*.

And the financial damage has slowly healed too. Extra work, frugality, and even a small boost from the developer of the neighborhood who took pity and decided to forgive a loan my old company owed him, all contributed. I took good care of my expensive new rental house, the rental market grew strong, and I found great tenants who now pay reliably even as they add gardens and lovingly maintain the house as if it were their own. It took a long time, but we're now finally ahead of where we were before making The Big Mistake.

In the end, I spent somewhere in the range of $200,000 on this educational experience. But in the long run, I would dare to say that I'm going to make a huge profit on it when measured over a lifetime.

I learned mind-altering lessons about business, law, personal character, and hardship. I learned how to be more frugal and button down when a storm hits. I learned how to be happy even when on paper, very shitty things are going on in your life. And I learned to appreciate the incredible good fortune I have now that I've come though that hard time.

I'm also working on learning about forgiveness. My goal is to someday be able to see this "Dean" character, pat him on the back, and say "Hey man, I'm sorry about the hard times we went through together. I know it was a tough time for you, and I forgive you." I'm not yet at this stage, since I still have the odd fantasy about breaking his neck in the crook of my arm after stabbing 450 ballpoint pens several inches deep into his eyes, abdomen, and neck while calmly reciting a poem I would write about how selfishly he handled our business situation. Oh yes, it would be an event that would have Hannibal Lecter himself taking notes**. But over time, as I become wiser and more mature, I will grow past this, and I'll be a happier man, and a better father and husband, for it.

The best revenge is living well. So I make a point of exacting this type of revenge with gusto every day that I live.

So why, you ask, has Mr. Money Mustache, the Commander in Chief of the No Complaints Nation written this novel-length complaint to you?

It is meant to be an example of how even bad situations can turn good, how pain leads to happiness, and how expensive lessons can still lead to riches. You just have to keep working at it, and hammering through it, one day at a time. Just make sure you end up a bit further ahead each night than you were when you woke up that morning, whenever you can.

Your problems WILL. BE. CRUSHED!!!

*I do not mean to imply that I am anywhere near as *cool* as this hypothetical piano player, just that I have been roughly that *happy*.

** **Update:** Over three years have passed since I wrote this, and the anger has almost completely faded. I still have no desire to ever see the guy again, but feel that with my new life as great as it is, there is really no reason for anger or regret over anything in the past.

Mustache on the Move: Heading to Lake Tahoe

By Mr. Money Mustache

Fri, 03 Feb 2012 13:01:47 +0000

The Cap'm

Once every year, a magical time comes where a bunch of grown men get to act like teenagers again for a week. It's called the Safety Pirates Snowboarding trip, and it involves a binge of out-of-bounds powder seeking, groomer speed competitions, moderate substance abuse, and late nights on the town or in the resort hot-tubs. The trip hits a new mountain location each year, and this year the unlucky town is Lake Tahoe, Nevada.

We know we're too old for this, but we are compelled by the persuasive abilities of the Captain of the Safety Pirates, a bossy and slightly insane Chicago resident pictured above. You wouldn't dare to say no to him, would you?

Then we all go back to our real lives and continue to raise our children, or tend to our businesses, or design video games, whatever the case might be.

So I'll be leaving this Sunday. I imagine this will have unpredictable results on the blogging schedule, since I imagine the pirates will have a busy schedule. Plus, the only computing device I'll have with me will be my tiny iPhone.

On the other hand, I'm sure there will be many things that need reporting. And I'm using part of this trip as a chance to research a city I've never been to: Reno, Nevada.

Reno contains the airport that serves Lake Tahoe, and it is an interesting place right now. One of the sunniest cities in the United states, it is surrounded by mountains and located at about 4500 feet above sea level and at 40 degrees latitude, which gives it an excellent climate for lovers of the outdoors (similar to but slightly warmer than Denver). Legalized gambling, tourism, and its location right next to one of the closest good ski areas near San Francisco has pumped money into this town, and led to a property boom in the mid-2000s. This boom collapsed at the end of the decade, cutting house prices in half in both Reno and its bigger neighbor seven hours to the South, Las Vegas.

So I'm going to take a look at the rental property market while I'm there, just for future investment writing.

If YOU happen to live in Reno or North Lake Tahoe and might be interested in meeting up for a chitchat or a beer – or even if you're a real estate agent willing to show me around briefly, get in touch through the contact button above! I'll be alone checking out Reno this Sunday afternoon from about 1-5, and in the Incline Village (North Lake Tahoe) for the rest of the week.

I also have two guest postings lined up to share with you next week. No, not little simplistic promotional guest postings, but real and thoughtful ones from powerful members of the Extended Mustachian Community who also have their own blogs. Stay tuned, they will be fun.

have a great week!

Guest Post from The Military Guide – Frugality is Not Deprivation

By Mr. Money Mustache

Mon, 06 Feb 2012 16:10:59 +0000

Nords at work in Hawaii

Today's guest post is brought to you by Nords of The-Military-Guide.com. This is a great blog about leveraging both the training in Badassity and the career perks offered by the US military to earn yourself some very early financial independence.

Some of you may already know him from Early-Retirement.org or his guest post at EarlyRetirementExtreme.com.
The book "The Military Guide to Financial Independence and Retirement" was written from the words of over 50 military contributors. All of the royalties are donated to military charities.

Frugality is not deprivation

I usually write for a niche audience of roughly four million people: U.S. military servicemembers, veterans, and their families. Of the 1.4 million servicemembers on active duty today, only about 15% of them will stick around for the typical 20-year military retirement. The reward for those few is an inflation-fighting pension with cheap healthcare.

Here's an interesting point. MMM has been showing us all how to become financially independent and retire early with no pension at all, and while paying for our own healthcare. A military pension and Tricare must make financial independence easy for everyone who retires from the military!

Sadly, that's not the case. Nearly 90% of military retirees pursue a bridge career. Yet they've already solved two huge early-retirement challenges: inflation and healthcare. So why aren't there more financially-independent military retirees?!?

It turns out that most military retirees aren't financially independent because… they aren't saving enough money. (Ouch.) The military has trained us to be financially responsible ("Stay out of credit-card debt!") but not to be financially independent. It just never occurred to most of us that we could retire from the service and stop working. We were putting in too many long hours in too many isolated places to find the time to read blogs about financial independence. Despite our low-cost lifestyles, most of us are blissfully ignorant about the retirement potential of high savings rates.

I'm trying to remedy that ignorance. Let's start by distinguishing between the concepts of "frugality" and "deprivation". If you're not in the military, just pretend along with me for a few paragraphs.

Oddly enough, the military teaches everyone how to live an extraordinarily frugal lifestyle. No matter what reputation your service has, at some point you've lived in a very small room with a narrow bed and almost no storage. Maybe you even lived outdoors without a bathroom (let alone a bed) and all your possessions had to be carried on your back in one piece of "luggage". Food was mass-produced or delivered in a pouch, and snacks were hard to come by. Entertainment was rudimentary at best– no satellite HDTV or Internet access, let alone clubbing downtown!

If we all know how to live as cheaply as Tibetan monks, then why don't we practice that lifestyle and save 80% of our paychecks? We'd all set new records for early retirement! Servicemembers could eat all of their meals in the galley, spend their spare time reading library books or studying for advancement exams, and work out in the (free) base gym. No money would be wasted on gasoline, energy drinks, alcohol, tobacco, or video games. No one would even need to buy civilian clothes. Veterans would have no problem retiring, and they could even continue the lifestyle– the galley, the library, and the gym.

The irony of this example is that we all actually do know servicemembers who live like that. They're perpetually hoarding their money, rarely socializing, and hardly ever going out. The problem with this single-minded focus on a Spartan lifestyle (and its extremely high savings rates) is that it's very difficult to sustain. For the vast majority of us, that life seems boring and frustrating. These people seem to be pretty one-dimensional and not much fun. Maybe they have a very good reason for squeezing every nickel (or maybe they can't stop themselves) but it doesn't look like a way to enjoy a career or a life. They'll make their short-term goals, but in the long term they'll drive themselves (and everyone around them) nuts.

There's a happy compromise to that cheerless existence. Frugality is just simple living: a lifestyle that avoids waste and matches your values. Extraordinary frugality, however, can be deprivation. Everyone can learn how to avoid waste, but everyone also has a standard of living they're not willing to give up.

Financial independence benefits from frugality, but it does not require extremes. It's your choice to balance lifestyle (and values) with the time it takes to achieve financial independence. It can be as little as five years, but most military could choose to do it in 20.

The difference between frugality and deprivation is derived from your values. Everyone has a dividing line between the two. Frugality feels good and makes you enthusiastic about reaching your goals. It's a challenge, and when you're doing well at it then you feel like a winner. You might not even miss the consumerism and the materialistic lifestyle. Frugality matches your values and frees up quite a bit of savings for financial independence. You're living a life that you enjoy and you're making progress toward your goals– it's easy to feel good about it. Deprivation sacrifices your values for a higher priority. It feels more like slavery than volunteering. You may be making great progress but it's definitely not easy and you will not feel good about it. Prolonged deprivation is extremely difficult to sustain and it usually leads to unhappiness.

The military teaches frugality, but that can put you at odds with a materialistic society. We even have expectations of the ranks– junior officers drive hot sports cars, senior enlisted have hefty pickup trucks, senior officers buy luxury SUVs and nice houses with lots of electronics and big yards. Even junior enlisted can stand out among their barracks peers with a nicer laptop or a new smartphone. If you're one of the few who can't flash an attention-getting possession, then you may be pitied. And everyone teases the junior officer driving a bicycle!

The more frugal you are, the more you may appear to be "left out". Again the difference between frugality and deprivation is how you feel about it. If you relish the challenge, enjoy the achievements, and have fun while saving money, then you're doing great. If you're amused by the comments of your shipmates then your frugality reflects your values (and probably your net worth). If you're feeling isolated or even unhappy about the lifestyle remarks, however, then you've probably crossed the line into deprivation. Unless you're recovering from a short-term crisis, you need to re-think your values.

Frugality and deprivation can change your values, maybe even permanently. An extreme example of this is the Great Depression. In the 1920s much of society was living very materialistic, even luxurious lives. In the 1930s many suddenly found themselves struggling to find enough food and stay warm, let alone have a job or even luxuries. They didn't volunteer for deprivation but they quickly became extraordinarily frugal and managed to cope with the trauma. Over the years their habits became ingrained and part of their value system. When the Depression and World War II rationing ended, these members of The Greatest Generation didn't completely revert to their carefree spendthrift ways. We all know elders who can whip up a gourmet meal out of leftover cornflakes. They can fix anything in the home and think nothing of (*gasp*) walking to their destination. They even know how to do without! The other side of their frugality, though, is that many of these people will not spend money. They may still shun mortgages or credit cards, might not even invest in the stock market, and won't buy newer technology. They may castigate others for waste and may even have difficulty treating themselves to a luxury without feeling guilty. Their values were significantly changed by earlier trauma and they may struggle with what they see as modern society's degenerate lifestyle.

Many people see frugality as tedious, time-consuming labor. Once again, it depends on what you value. Cooking a meal from scratch is almost always more effort than dining out or picking up fast food. But you may feel that you get more value from preparing your own healthy, creative, high-quality meals. You might enjoy cooking as a hobby, not endure it as a chore. You may think that restaurant meals lack your talent for nutritious ingredients, proper seasoning, and creative presentation. The crowds, noise, and traffic might be discouraging. Or perhaps you prefer to save dining out for special occasions, and the experience would be less enjoyable if you did it every day.

But while you're quite happy to eat at home, you may draw the line at rinsing and re-using plastic bags. It doesn't matter to you that others see this labor as keeping waste out of landfills. You're not willing to spend your time on the same goal.

Practice the frugality that brings value to your life, keep an open mind for new ideas, and stop short of the deprivation line.

Frugal zealots may be accused of taking advantage of others. For example, there's nothing wrong with choosing to drink water during a restaurant meal (instead of sharing a pitcher of frosty beverage) or to order smaller, cheaper menu items. However if you're sharing with others then buy the next round of drinks. Don't help yourself to food that you're not paying for, or to skimp on your portion of the tip. That's not being frugal– that's being cheap. Frugality means avoiding waste and spending money on the things you value, not tricking others into spending their money on you.

Frugality is a flexible lifestyle. Learn about as many techniques as you can and then choose the ones that you feel bring value to your routine. You may enjoy the daily challenge or you might decide to only be extra frugal if you had an emergency expense that month. Start with small steps (like bicycling for short trips) and then take bigger ones (bicycle commuting). Drying laundry on a clothesline is no problem when you're single, but the labor might be a bit much with a large family of small children who are too young to do their own laundry. Monitor your spending, decide what's worth your effort, and change your habits as necessary.

Families can adopt frugality very easily and raise children with strong life skills. If you attempt to impose deprivation on your family, however, then you'll be facing rebellion in the ranks. Start with small steps, be patient, and be ready to compromise.

When you cut your waste and reduce your consumption then it's easy to raise your savings. And once you start that then you're on the road to financial independence. The length of the journey and the route you take are up to you.

—-

Many thanks to Nords, (who I like to call Mr. Military Mustache) for sharing this perspective with us. You might also enjoy his blog (The-Military-Guide.com) and his article that appeared on Early Retirement Extreme last summer called "Join the Military to Get Rich?"

Mrs. Money Mustache Remembers

By Mr. Money Mustache

Wed, 08 Feb 2012 16:43:29 +0000

 It looks like we've just passed the ten month anniversary of this blog and are creeping up towards one year. Just like with having a child, in some ways it went by quickly and in other ways it seems like this baby has been around forever. The best part is the community that has been built here and I promise that soon you'll have an even better way of sharing ideas through the forum (once I get this security and pharma hack thing handled).

Thanks to all of you for being supremely awesome.

Today I'm doing an unauthorized post on the blog while MMM snowboards in Tahoe. I guess you could say that I'm hacking the MMM site.

As Mrs. MM, I have heard MMM preach the Word for years (nearly 18 years, to be precise), yet somehow these articles sometimes resonate with me more than hearing him tell me in person that I should be biking. Some of my favorite posts are from the earlier days, so I thought I'd post links to my 5 favorite articles and encourage everyone to look back and comment.

Let the good times roll!

1. What would the Native Americans Do?
I read this when I need motivation to get off my butt and become a true

badass.

2. The Coffee Machine that can Pay for a University Education
Ramit — are you reading this?

3. How much is that bitch costin' ya?

4. Frugality as a Muscle

5. A Millionaire is Made Ten Bucks at a Time

My Favorite MMM Quote: "…And we both believe that the modern world is an Absolutely Excellent place, a dense and flowery jungle completely packed with Mangoes of Opportunity that spray their Juices in our Faces every time we take another muscular step through the foliage."

Brave New Life: Understand The Marginal Utility of Money

By Mr. Money Mustache

Thu, 09 Feb 2012 13:02:45 +0000

Today I have the rare opportunity to share a guest posting from my Southern Colorado friend who runs the Brave New Life blog. Brave, as I like to refer to him, is a family man with two children. And he is about 477 days away from beginning his own early retirement. His blog offers wise perspectives on lifestyle and philosophy from a man who only recently made the switch to running an efficient and frugal life. He also has the unique trait of ridiculous dedication to mastering tasks, having gone through stages of extreme career dedication and ultramarathon running. Now he has turned his attention to early retirement with the twist of acquiring very advanced investment knowledge as a side hobby.

Core Principle #5: Understand The Marginal Utility of Money

This post is part 5 of an ongoing 8-part series. The series is presenting 8 fundamental principles of what I've been referring to as a Brave New Life. Each step builds upon and supports the other steps, so I would encourage you to start from the beginning, preferably before you continue with this post.

When Mr. Money Mustache asked me if I'd like to present one of my core principles on MMM, I have to admit that I was both excited and intimidated. It's like Michael Jordan just asked me to sub for him, and I've got thousands of people watching me with very high expectations. So before I begin, let me warn you that I lack the fun, arrogant wit and charm of the great Mr. Money Mustache, but I'll do my best to step it up. Also, I'll probably fail to sprinkle in the swearing that you've all come to expect here…

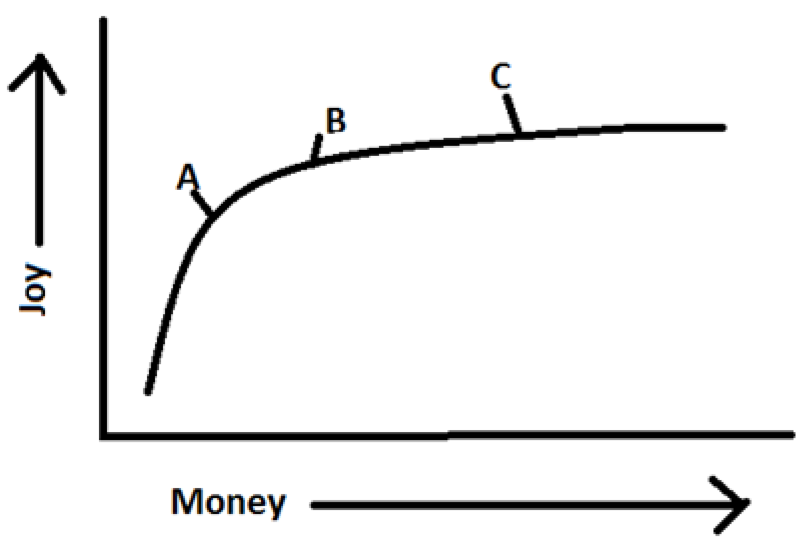
The Marginal Utility Of Money

I'm here today to show you that money does not correlate linearly with happiness (not even close), and that recognizing this fact can be a powerful tool. In order to understand this, you simply need to consider the "marginal utility" of money. Understanding the concept of marginal utility is nothing complicated, but it's something the average person refuses to consider. Luckily, you guys aren't average people, you're Mustacheans!

Marginal utility of money is the amount of value (happiness) gained from an increase amount of money available to you. This value changes depending on how much you already have stache'd away. Put another way, the value I get from saving an extra dollar means a lot more than to a billionaire.

Since the goal of the brave new life is peace of mind and joyfulness, let's go ahead and look at the completely non-scientific correlation between money earned and saved and the joy it brings.

Everybody's chart is different, but it will look something like this:



Point A is the point in which you have enough for the basic necessities of life: food, water, and shelter. Since you're reading this post on a computer, I'll assume you already have food, water, and shelter available to you. And since you already have these, you already have access to most of the joy that money can buy. That's an important thing to understand – you already have most of the joy that money will ever buy for you.

Point B is the point at which you have enough for more of the luxuries we have in the modern world like a safe home of your own with heating and cooling, a car, higher education, and maybe a homemade bread maker. Once again, it's up to you to define what you consider Point B.

Point C is financial independence. As you can see, it's not that much higher than B on the happiness chart, and your overall joy will never rise significantly higher due to an increase in spending. And if your happiness won't rise significantly higher by spending money, then why trade your valuable time to collect more of it?

OK, I get it. So now what?

Understanding the marginal utility of money is important for two reasons.

1. It forces you to realize that there's a diminishing return in earning money.

Many people assume more money is always better, and they allow the potential for more money to be a carrot on a stick. They just keep pursuing it, never pausing to reflect on what they're really after. It starts out with working a few hours of overtime, then 80 hours a week including weekend. Then they're telling you how to dress. Next thing you know you're 80 pounds overweight, divorced, and watching the news alone in the Marriot Suite's at 6am on a Thursday, getting ready for a big sales pitch.

But once you recognize the marginal utility of money, and compare that to the marginal utility of your time, you can consciously decide to turn down money in order to gain more time – thereby regaining control of your life.

Picture the chart above, but replace "Money" with "Free Time." The relationship between joy and free time exists, and the curve will look very similar.

I picture happiness as a cumulative thing, so in order to maximize overall happiness, you want to find the right balance between earning money and creating free time. This consideration, I suspect, is what drove MMM's decision to retire at 30 and the reason I'll be retiring soon at 35. Since I'm already on the flat area of the Money/Joy chart, I have very little to gain trading my time for money. Instead, I'll achieve far more happiness by quitting my full-time job, freeing up time to spend playing with my kids and teaching them.

Here's a real life example: I have a pretty good job, work with great people, and in general I don't mind doing it for 20-30 hours per week (which is what I usually put in these days). But my company has this really rigid format for bonuses where they lay out specific tasks that you must do in order to get portions of your quarterly bonus. And one of the tasks this quarter is asinine. It has nothing to do with my job, and adds no value to me or the company. I despised the idea of doing it…

A basic time/money financial analysis shows that it's about 10 hours of work for $800 worth of bonus. Not a bad return on time. But I'm past point C on the chart above, so now if I factor in my marginal utility of money, I recognize that $800 has a negligible effect on my overall happiness. I'd rather have those 10 hours to play outside with my kids, read a book, or throwing rocks at a tree. At least then I'll be satisfied in knowing that I'm not selling my time for something I don't support.

2. You can redefine your own marginal utility of money

The second benefit of understanding your own marginal utility of money allows you to redefine it. If you just avoid thinking about it, the evil marketing companies will be glad to define it for you. They prey on people that don't deliberately define their value of money, but Mustacheans are too smart for that! Marketing firms would have you believe that Point A requires a car, a big mortgage, eating out at least twice per week, and obviously cable TV (so they can keep talking to you!). But now that you've been made aware of the real value of the money you're earning and spending, you get to control how you define points A, B and C. Personally, I've been to some villages and slums in India, and there I saw what I define as point A and what I would consider below point A. These conditions don't exist in the US and most other developed countries, which is a good thing.

Now that you realize that YOU get to define your points A, B and C – you can literally tweak your happiness. Seriously, it really works! Over the past 18 months, I've made serious changes to my life. I've downsized my house, sold my car, changed jobs (taking a lower income), moved across the country, and overall simplified my family's life. And while I'm much happier now, I have to admit that the single biggest change to my happiness came when I redefined points B and C. I greatly reduced what I considered luxuries, and what it takes to be financially independent.

You guys are lucky, because by reading MMM you are already slowly having your definitions of points A, B and C reduced in needs and wants. But it's not enough to sit back and let MMM and the rest of this community define these things for you, no more so than letting a marketing team define it for you. Everyone is different, and you have to deliberately define your own personal needs and wants along the Money/Happiness chart. Besides, it's a fun exercise. And if you have a spouse or older kids, bring them into the discussion too.

Cliff's Notes

Let's revisit the basic concept of this post to wrap things up. Here are the key points.

- The value of each dollar you make depends on how much money you already have. If you already have "enough" then it's not worth much at all when it comes to happiness
- You can define your personal value of an additional dollar
- Once you have "enough" you can free up your valuable time to do things you enjoy. This might be in the form of switching from full-time to part-time work, the ability to turn down crappy work for a few extra bucks, or an early retirement like MMM

- You will never have enough money to retire if you let TV commercials define your needs and wants

The Brave New Life Chart

Warning: If you didn't go back and read the previous posts in this series, this chart may look a bit confusing and overly complicated. With each principle I present, I try to show how it fits visually into the brave new life.

As seen in the chart below, the idea of understanding and defining your marginal utility of money has two direct paths to happiness. First, it allows you to more quickly achieve financial independence by giving you the opportunity to define how much money you really need. Second, because you will be less likely to do work just for money, it frees up your time to do things you truly enjoy.

Understand the Marginal Utility of Booze and Drugs

By Mr. Money Mustache

Mon, 13 Feb 2012 13:00:14 +0000

Well, the Safety Pirates have finished their raiding of the Reno/Lake Tahoe area, and returned home to their lives of responsibility. As expected, the trip has furthered my education in several dimensions of Mustachianism and led to some insights. And the title of Brave New Life's guest posting on Thursday nicely describes one of these dimensions, so I have closely emulated it for today's article.

For decades, Mr. Money Mustache has walked a fine line between two worlds of people. One one side is the productive and healthy and slightly nerdy land of the non-drinkers, and on the other is the reckless and fun and slightly self-destructive world of the drinkers. I meet many people who are deep in one territory or the other, but a much smaller number who are right in the middle. I know these people do exist, but there seem to be forces in human nature that push us to extremes. So people without much enthusiasm for alcoholic beverages or other recreational drugs end up quitting completely, and people who enjoy them end up taking things up quite a few notches in their youth.

Because of my place in the middle of the spectrum, there have been many nights in my life which have involved consuming a few servings of the various party supplies, and if all goes well, getting just a bit out of control and silly. Laughs are had, lifetime stories are created, and ridiculous songs are recorded.

But at some point around 10PM, I realize that if I have another drink, I will severely regret it in the morning. After fearfully imagining a hangover, I will invariably start running through the things I hope to accomplish in the next day as well as the various other reasons I don't want to dump more mild toxins into my body, which hasn't been 18 years old for about twenty years. So I'll fill up a big glass of water and start drinking it, repeating the process until the party ends several hours later. Meanwhile, the true party people will keep pouring themselves stiff drinks or cracking more beers. We're all having a great time, but when the night is through there will be four or five bottles in front of me while a heavy-drinking man of my size will have a dozen or so, possibly with a few wine and shot glasses on the side (and maybe an empty bag of weed depending on the crowd).

As this pattern has repeated across the many years since I was a teenager, I have seen heavy drinking pulling down quite a few of my friends and coworkers. The luckiest ones are just less wealthy than they would otherwise be. Others have gained weight and lost the ability to do active things outside, in turn leading to other health problems. The least lucky ones are now dead.

The difference between light and heavy drinkers is multiplied further when they are placed into an environment where alcoholic drinks are ridiculously expensive, which is any place other than your house. The light drinkers will escape the night with little or no financial damage, depending on how much fun was had before ending up at the bar*. The heavy drinkers will dump out tens or even hundreds of their scarce dollars, with nothing more to show for it at the end.

Much of this difference is explained by alcohol tolerance. Just as your body can adapt to cold and hot weather, bicycle commuting, food surplus and shortage, and almost anything else you can throw at it, so can it adapt to repeated floods of alcohol through the blood stream.

Alcohol tolerance is still looked upon with respect in certain circles. High school football players, mustachioed gamblers in Westerns, and college students on spring break still all slap each other on the backs after they pound a fifth of whiskey or funnel a gallon of Bud Light. These people may indeed be somewhat cool, because they have developed an unusual ability through perseverance and ignoring pain. But it's a misguided form of coolness, because it runs directly against the Bushy Follicles of the Money Mustache.

A Mustachian does NOT want any sort of alcohol tolerance. It's a sign of weakness, because it is a sign that you drink too much, and too often. Wikipedia sums this issue up perfectly: "Long-term use of alcohol in excessive quantities is capable of damaging nearly every organ and system in the body". It will also damage your finances to the tune of several hundred thousand dollars over a few decades.

Deep inside, we all know that any alcohol consumption is bad for us, and we also know that it is a purely optional expense. And developing a tolerance is a double expense: Not only does it takes a lot of spending to create the tolerance, but it decreases the pleasure felt from all future alcoholic beverages. So my heavy-drinking friends on the Party side of the dividing line have to spend twice as much as I do, just to experience exactly the same amount of Good Times.

We Mustachians are an extremely diverse lot. Many of us are masters of self-control and I regularly hear from people who have willed themselves into incredible feats. Just the other week there was a guy in the comments who casually recommended running 70 miles per week as a convenient method of weight control.

But there are also many beginners in training here, and surely a division of masters of self-deception as well. "I don't really drink all that much. Way less than my friend Joe. I'm still functioning well at my job and I'm even pretty athletic. And I really like having a few beers with my friends. Sure, on the weekends that may turn into a dozen beers.. but what's the problem?"

The problem is simply this: *you could be even better.*

Are you already completely financially independent? If not, there's a huge and unarguable reason to limit drinking to, say, two drinks per week as a personal challenge. You can't yet afford to be throwing away money!

Do you already have exactly your idea of an ideal body? If not, alcohol is a very powerful drug for fat gain – why continue regular dosage when it works directly against you?

Are you already able to accomplish any task you set your mind to? If not, this is a great one to work on. Alcohol is difficult to reduce and quit. Whenever something is difficult, that's usually a sign that you should start doing it. Every drink you skip or postpone, builds your self-discipline muscle, one of the components of the larger Frugality Muscle group.

The bottom line is that Alcohol, like many other drugs, is addictive to many people. That brings up some very confusing feelings about whether or not we will gain happiness by drinking more of it.

I do believe it has some use for increasing the amount of fun in our overly repressed society, which is why I'm not a complete non-drinker myself. But I also feel it comes with a marginal utility curve that starts to slope down very quickly, and that most drinkers are already way beyond the peak.

Even with all this caution, I **also** feel that while Mr. Money Mustache dishes out some good advice, there are special occasions in life when all good advice must be damned and you must go crazy. But when you go crazy, you should at least acknowledge that you are being crazy and *not* rational. And you must realize that I am right there watching you, glad that you are having a good time, but watching and waiting with a Brandished Fist for signs of Excusitis, the failure disease.

Drink wisely and rarely**!

* The whole idea of bars has always seemed sucky to me – you can have expensive drinks and too much noise for real conversation at a bar, or you can have cheap drinks, great food, and your own comfortable house for talking, even without giving up the benefit of meeting attractive strangers, when you host or attend actual parties.

** In the spirit of this article, I'm cutting my own drinking limit from the previous MMM limit of six drinks per week, down to TWO (with rollover beers still allowed), and looking forward to reaping the benefits!

Introducing the Money Mustache Forums!

By Mr. Money Mustache

Tue, 14 Feb 2012 13:00:15 +0000

Hey! What's that new link on the menu above? FORUM??

YEAH! The Mr. Money Mustache blog now has its very own FORUM!!

Technical Wizard Mrs. Money Mustache has set it up, and I have pre-configured it with a variety of exciting topics that should spark discussion.

Check it out at https://www.mrmoneymustache.com/forum/

As with most online forums, read-only access is conveniently open to anyone. You only need to create a user account and sign in if you want to post messages.

For other webmasters considering a similar step, we used the "Simple Machines" forum, which was easy to install on the Bluehost hosting service.

Configuration takes a bit longer than the installation, but it mostly involves just clicking your way through a bunch of menus and making sure all the childish options are off (increasing privacy and permissions, turning off smiley face icons and censorship, etc).

Volunteer Moderators are welcomed. And helping out others is highly encouraged. From now on, I encourage readers to post their detailed personal finance questions in the "Ask a Mustachian" forum rather than sending them to me via the contact button. I'll still see your request, but it will have a much higher chance of being answered since I don't have time to respond to all of the longer emails anymore. And many of your fellow readers have already experienced, and solved, exactly the same problems you are now working on!

Enjoy!

Update: *Holy Crap: just a few hours after its formation, this forum is taking off already! In yet another awesome demonstration of the power of crowdsourcing, The Mustachians have started talking amongst themselves and answering each other's questions. What fun!*

Happy Approximately Valentine's Day

By Mr. Money Mustache

Wed, 15 Feb 2012 17:23:16 +0000

Sexier than Retail

Mrs. M and I recently learned that this is the week that the department stores like us to celebrate "Valentine's Day".

I approve of this special day, because hey, love and romance are good things. So are little paper hearts that you and your kids create and draw pictures on. But as usual, there are some sneaky aspects to the special day that tend to confuse standard consumers, mixing positive emotions with unnecessary activities.

My wife and son spent a good amount of time over the weekend cutting up pieces of colorful scrap paper to become Valentine's day cards for his twenty four kindergarten classmates. They even added silly designs and created some simple origami dragon heads that pop out and attack you when you open the card. It was a great way to pass an hour or two of a Sunday while I lingered nearby cleaning up the kitchen and making some supper.

On the actual V-day, he delivered the fancy cards to his classmates, and was pleased to receive almost 24 cards from the other kids in return. We all had great fun reaching in over and over again to the paper bag he brought home from school, reading each card and checking out the design.

But there was something odd about the cards. Almost all of them were manufactured and store-bought rather than made at home, and about half of them came equipped with plastic trinkets and/or chunks of candy. Things had changed quite a bit since I was a kid. My son was still delighted, of course, and he meticulously pulled off the candy pieces and stored them in a separate pile for safekeeping. Surely an early sign of a tendency for 'stashing.

I'm certainly not criticizing or demeaning my fellow Kindergarten parents. These are hardworking and honest folks who love their kids, and they are participating in one of our fun cultural traditions in the only way they currently know how to do it. Most people in this world are not Mr. Money Mustache readers, so we must forgive them.

But from my own vantage point, I still marveled at sheer amount of waste that went into even this small paper bag of trinkets. I couldn't help multiplying it across the nation's tens of millions of young children, and imagining the industrial printing presses in China, the liquid plastic pouring into molds, the delicate hands of the foreign factory workers rapidly sorting cards and action figures into bins and packages, the trans-Pacific cargo ships churning their thirty-foot propellers through the saltwater, cranes in Los Angeles, 30,000 horsepower BNSF freight trains straining to cross the Rocky Mountains, forklifts transferring pallets of cardboard boxes from railcar to transport truck, more forklifts shuffling the boxes through the loading bays of Target and Wal-Mart, teenagers stocking the shelves, and eventually the garbage trucks hauling the goods a few weeks later to a 390-acre landfill, with diesel compactor machines rolling over the mountains of trash and hundreds of seagulls scavenging at the periphery. Then silence as the plastic trinkets are buried under more trash, and begin a 100,000-year decomposition process.

I also marveled at the energy that went into just getting to and from the stores to purchase these things. "Oh shit!", my fellow parents surely said sometime in the past week. “It’s Valentine’s day next week! I’m too busy to make anything at home – we’ve got two careers and two kids. Let’s get something quickly at Target”. So a 4200 pound minivan or SUV with a 240 horsepower 3.5 liter engine was fired up and piloted through a four-mile roundtrip of stop signs and busy intersections, parked in a giant parking lot, then returned to the driveway with its 400 pound aluminum engine still searing hot from the waste heat of petroleum propulsion. The energy expended in the 10 minutes of driving was about the amount an adult human needs to live for 96 hours. The haul from this expedition: about one ounce of plastic and paper.

That all sounds somewhat bleak, but also quite fascinating. And although you’ll think this is strange, my mind flashes through this sequence pretty much *every* time I think of buying a manufactured product, or see someone else buying one. It’s a bit painful, which is why you occasionally hear me talking about punching really blatantly wasteful people in the face. But it is a good pain, because it is the byproduct of understanding how the world actually works. With knowledge comes power, and also a refreshing freedom from the burden of wanting so many manufactured things.

So what does this all have to do with Valentine’s Day? It’s the same thing it has to do with every other major consumer holiday. It’s the idea of using your newfound Mustachian Training to identify the underlying joy and feeling within each of our cultural occasions, and unpack it from the unnecessary glossy consumer packaging. Experienced readers will notice that I write a rant like this for pretty much every special day of the year, shooting it down and yet simultaneously lifting it up so we can all start having some *real* fun around here.

Every Valentine’s Day, Mr. and Mrs. Money Mustache have traditionally gone out to some sort of nice romantic dinner, or stayed home to cook one. If we’re going out, we won’t do it on the actual February 14th, of course, since that’s when everyone else does it and the restaurants are busy. A day or two before or after is a much better choice.

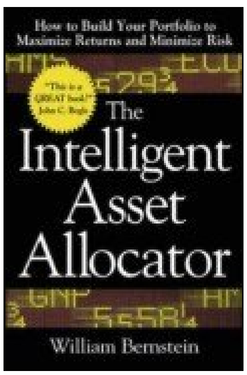
And if it’s romance you have in mind, you don’t necessarily need flowers that somebody else grew or an expensive chunk of jewelry that someone else made. What about making a new resolution to deliver more attention and respect to your mate instead? What about making a point of grooming yourself to top condition, wearing the clothes your partner happens to find you most attractive in, and delivering a kiss that is entirely too sexy for people who have been together as long as you have, at an entirely unexpected time or place? If you throw in a multi-course meal with dessert, you've beaten any diamond ring in terms of creating good memories.

Valentine's day is one of my favorites. Just don't let the confused spendy consumers around you dull its intensity by mixing it with rounds of retail shopping.

Book Review: The Intelligent Asset Allocator

By Mr. Money Mustache

Fri, 17 Feb 2012 13:00:06 +0000



What's your style of investing: Stocks, or Bonds? And if you say "Stocks", are you fond of Small Cap or Large Cap, and would those be in the categories of Value or Growth, and in US, European, Asian, or Emerging Markets?

I've learned that readers of Mr. Money Mustache vary widely in their response to a question like this.

Some will immediately scoff at the simplicity of it, slicing each of the investment types above into further subcategories and then commenting on their appropriateness given our current position in the business cycle.

Others will discount stocks and bonds entirely, muttering something about "Federal Reserve toilet paper" and "Fiat money", before talking about their portfolio of precious metals (and at the extreme end of this position, stockpiles of canned food, guns, ammo, defensible land and tinfoil hats).

And quite a few of us will say, "I have no effing idea – I just checked a few appropriate-looking boxes on my company's 401(k) signup sheet and I've got the rest of my ‘Stash in cash because I don’t feel comfortable enough to invest massively in stocks!”

One of the goals of this blog is to get the latter category of people to get off of their asses and start learning about real investing. You do this by reading books – you might even start with those mentioned in the Book Recommendations page right here on MMM. But you must do it.

The good news is, you don’t need to know anything about investing to *start* saving for financial independence and early retirement. Learning frugality and how to live an efficient lifestyle is by far the most important part. Paying off all your debt is a good first step. And after that, while your savings are still small, your loss from not investing is small.

The bad news is, every $100,000 you have sitting around in a 1% bank account is missing out on about $6,000 per year compared to what you’d get by investing it well. Right now, it is actually *shrinking*, since it is growing more slowly than inflation. Your hesitance to read a few investment books is costing you $500 *per month*, for each hundred thousand idle employees.

So I’m writing this post under the guise of a book review of *The Intelligent Asset Allocator by William Bernstein*, but it’s really more than that. An understanding of Asset Allocation is a useful and necessary brick in your understanding of stock market investing, and it is something I’ve never covered properly on this blog before, so here we go!

Let’s start with the concept. In a long-ago article on stock investing, I described the basic idea of an index fund and suggested that you don’t have to know *anything* about individual stocks. You just need to find the right index funds, with the lowest management fees. By using the Vanguard investment company (www.vanguard.com), you get this without any further research.

But in that old post, I oversimplified things by only mentioning the VFINX index fund – a fund that holds only very large US-based companies. That’s still a good no-brainer investment choice for long-term growth, but the concept of Asset Allocation takes it up a notch by offering less volatility (which we all understand thanks to the past decade) while sacrificing little or none of the long-term performance. To understand how this could be, check out the following example:

Imagine you start with a $1.00 investment.
Now you start flipping a coin. If the coin comes up Heads, your investment goes up by 30% For Tails, you lose 10%.

After one coin flip, you could be one of two places:
Up 30% so you have $1.30 : there's a 50% chance of this
Down 10% so you have 90 cents : also a 50% chance

But what if we start over and split our money in half and add a SECOND coin, and bet 50 cents of our money on the outcome of each coin?
After one flip, you could be any one of four places:

Two Heads:
both of your fifty cent chunks went up by 30%. The are now 65 cents each, totaling $1.30.

Two Tails:
Both chunks are down to 45 cents each. You have 90 cents.

A Head and a tail:
One chunk is worth 65c, the other is 45c, you have $1.10

A Tail and a head:
One chunk is worth 65c, the other is 45c, you have $1.10

Note that each of these outcomes has an equal probability of happening: 25%. But notice how you now have a three out of four chance of making money, and only a one out of four chance of losing it on any given flip. Over time, flipping the single coin and the double coins will yield exactly the same long-term returns: an average of a 10% gain per flip. But flipping the double coins will provide much less volatility.

As it turns out, you can do almost the same trick with stocks by understanding the principles of Asset Allocation (also known as Modern Portfolio Theory) explained in this book. Although it's not a new idea, it is still quite magical, because we are getting less gut-wrenching volatility without compromising on the long-term return.

The reason this works is because the results of the separate coin flips are *uncorrelated*. To re-create the smoothing effect of flipping two coins with stocks, investors need to find stocks (or "asset classes") that are also not correlated.

At the most basic level, this is the idea of "diversification". If you buy one randomly-selected stock on the stock market, and I buy twenty, on average we might be expected to earn the same annual return, but your stock will swing wildly while my mixture of twenty will tend to cancel each other out and move more smoothly.

But if you look more closely at a graph of the share prices of two large US company stocks, even in different industries, you will find that they are still heavily correlated. They zigzag up and down together in response to the short term diaper crappings of market speculators over irrelevant news headlines. Similarly, if you compare the movements of a stock index of ALL the large US companies and the movements of ALL the small US companies, you'll see a similar correlation. With correlated assets, you don't get the full benefits of the double coin flip, so you can't shake the volatility.

But Asset Allocators have figured out a way around this. By studying detailed historical price charts of many types of assets (stocks and bonds of multiple countries around the world), they have found an appropriate mix of healthy investments that tend to move much more independently of each other. Bonds, for example, often move in exactly the *opposite* direction of stocks.

The book offers interesting explanations on how this all works out mathematically, but let's just skip directly to the end result: *You get the best results by owning at least four asset classes*.

If you only want four, the author suggests you might hold these ones, by simply plopping 25% of your investment portfolio into each:

US Large-capitalization stocks (as measured by the S&P 500 index)
US Small-cap stocks (the Russell 2000 index):
Foreign stocks (the Europe, Australasia, and Far East index, also known as

EAFE)
US short-term bonds

If you wanted to do all your investing with Vanguard funds as I do, you might throw 25% each into VFINX, VB, VDMIX, and VBISX.

Now you're nicely diversified and owning slices of thousands of companies across the world with only those seventeen capital letters. It is truly an amazing and convenient world we live in. But there's one last step: rebalancing.

The book explains that due to various market manias, occasionally one of these asset classes will start to inflate into a bubble, even while others will drop in price. To take advantage of this, you sell the funds that have appreciated, and use the proceeds to buy the assets that have gone on sale. Once per year, you simply make the appropriate mix of sales and purchases to set all of your allocations back to 25%, and you have effectively done a "buy low, sell high" move without even knowing what companies you own.

To beginner investors, this sounds crazy, and to advanced ones, it sounds like "well, DUH!". But if you read enough investment books, they will convince you that the math and statistics behind all of this show that rebalancing works out quite well over the long run. You get reduced volatility and increased returns, with very little effort.

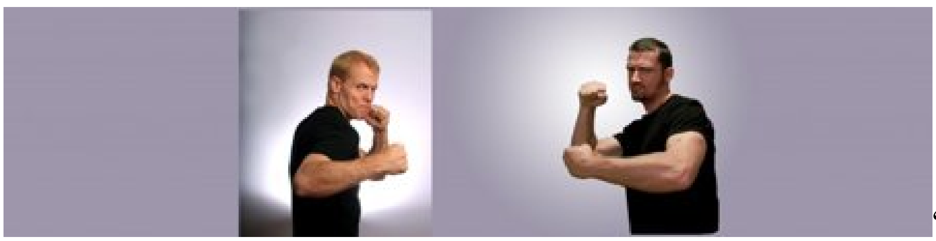
And the convenience goes even further: there are even index funds that will do this asset allocation and rebalancing *for you!* Vanguard's VBINX fund, which I have recommended in the past, automatically maintains a 60/40 split of US stocks and bonds. There are surely other funds out there which will do a full 4-way round-the-world allocation as well (if you know of one, let me know and I will update the article).

So it's a good book. Financial and engineering nerds will eat it up. But people who find even this article's attempt at an introduction to the topic confusing will probably want to start with a more general-purpose investment book, like The Four Pillars of Investing, by the same author.

Mr. Money Mustache vs. Tim Ferriss

By Mr. Money Mustache

Mon, 20 Feb 2012 13:03:50 +0000



"Who is this Tim Ferriss guy?"

If you find yourself asking that question, then congratulations, you get five extra Mustache Points for not tuning into US mainstream media for the last several years. In fact, I myself was blissfully unaware of his existence until I started this blog last year and noticed everyone either worshiping or criticizing him.

For those just tuning in, Tim Ferriss is the dude on the left. In a fit of Photoshop brilliance, I put on a similar shirt, photographed myself doing a fake punching move, and added myself on the right, just so you will think that I am in the same dynamic and exciting league as Tim. He's an interesting man indeed, because despite being a bit younger than me, he has already started a few cash-spraying companies, popularized the "Lifestyle Design" movement, published two bestselling self-help books, and met many of the world's famous people* – not to mention winning various competitions in unusual disciplines like Tango and Chinese Kickboxing.

Because of all of this success, he has spawned competing armies of copycat followers and sarcastic mockers. The twentysomething followers start their own lifestyle design blogs and tell the world to "Be Awesome! Live life your own way instead of taking it from The Man!". And the slightly older mockers point out the flaws in the philosophy and complain about the annoying self-entitled confidence of both Tim and his followers.

I have watched both sides of this argument with a slight nervousness. Without even knowing the field existed, I may have accidentally started a Lifestyle Design blog myself. In fact, I once saw a Twitter comment that a stranger posted linking to one of these MMM articles that said something like, "Awesome stuff – Tim Ferriss and this guy should have a baby together!"

But which side of the argument is right? Is the concept of "The Four Hour Work Week" compatible with Mustachianism? To find out, I took time out of my busy schedule to carefully read Tim's seminal work, The Four Hour Workweek.

In a word, I'd describe the book as "Surprising!". I have never read a book with so many unusual and counterintuitive ideas, presented with such confidence. I mean, I thought I was slightly odd for describing the fact that over 50% of the rich world's consumption and work is irrational, stupid, and should be stopped immediately so we can all start having some real fun with our lives. But in many ways this book out-stranges me. And many of those ways are quite good.

Let's start with the basics: Tim went to a good university and got a good job after graduation. But he's a hacker, so he wasn't satisfied with the ratio of reward to effort. He started his own company on the side selling sports nutrition supplements, which did well. But he found it was sucking up growing amounts of his time each week. At 80 hours, he snapped and decided something had to change.

Then he figured out how to empower other people to run the business for him and get the whole thing to go mostly on autopilot. At this point, he found he was making something like $40,000 per month, yet only working four hours per week. Hence, the idea of the Four Hour Workweek was born.

Using his newfound freedom, he toured the world and learned lots of interesting new skills. And eventually, he wrote the book itself, using some very clever tricks to go from novice author to #1 New York Times bestseller in just a few months.

That's a drastically different and more exciting path than my own, yet we both ended up financially free at about the same age. There's an obvious difference in that his financial freedom is based on a very high level of income and spending, while mine is is way down near the US average. But the interesting part is that we both realized the same things once this freedom was reached: life is not so much about money or possessions, it's about freedom of time and mobility to go wherever you like. And it's not about *not working*, it's more about *not being tied down to any particular job*.

There are several more concepts and quotes I liked in this book:

- "Most people work decades in a job they hate, with the vague promise of retirement as their motivation. How would your choice of work/life balance change if retirement was not an option?"
- Most people focus on being *busy* rather than being *productive* at work. By walling yourself off from distractions, meetings, and even spurious emails at your (office) job, you can usually double your hourly productivity. Then leverage this into a work-from-home arrangement where you continue to do the same job, in only half the hours.
- To someone who becomes good at making deals with other people, *reality is negotiable*.
- Cancel your TV, your magazines, your casual websurfing, and your newspaper subscriptions. Put yourself on a low information diet where you only take in things that are relevant to your goals.
- The old way of work (fixed hours and work days in a fixed location) does not work well with the natural human cycle. We have waves of creative energy and inspiration, interrupted by periods of downtime.
- Setting ridiculous goals and disregarding common objections to them often works surprisingly well. Getting in touch with company CEOs or other famous people and asking them to help you, getting a job near the top of a company, or creating massive publicity for your own

products. All of these things are easier and less competitive than expected, because most people are afraid to even try them.
- Expand your comfort sphere by doing uncomfortable things. Getting phone numbers from attractive strangers. Negotiating for prices everywhere you go. Asking your boss for a raise. Lying down on your back in the middle of a crowded pub.

That's all exciting advice. Although you'll find it in many business and self-help books, it means more to me coming from a very young entrepreneur than it would mean to hear the same things from a crusty old fortune 500 CEO. But eventually the book goes off into a new direction: outsourcing your entire life. Ferriss describes his experience with hiring Indian subcontractors as "Virtual Assistants" – people to book his meetings and travel, do his online research for him, even organize social events and help his business with special projects. The idea is that for under $10 per hour, you can hire really clever people to do a good chunk of your work for you, so you can do your even more important work.

It all started sounding very practical and clever until I realized that I don't need assistants, because I have taken the opposite approach and designed simplicity right into my life. I have plenty of time to take care of anything that needs doing by myself, with plenty of time left over. Sure, I still automate away some of the busywork using computers and other gadgets (automatic income deposits, bill pay, bank account transfers, financial tracking, online calendaring and documents, etc.), but with those bases covered I find there is not much else that needs doing.

And that's where we find the biggest contrast between The Four Hour Workweek and Mustachian Early Retirement. Tim goes into great detail on how to start an online business that sells products to people. That is supposed to generate passive income so you can live the life of your dreams. Then he encourages you to add up all the costs in the life of your dreams. "It costs less than you think!", he says. One example he gives is that you can lease a Lamborghini Gallardo for only $2800 per month. Wow! No problem!

The idea of earning financial independence by *actually amassing some of your own capital* is quickly dismissed. To paraphrase,

> "To retire on money alone, you'd need like a million dollars, which not many people can accomplish. And even if you did get that million dollars, inflation would be eating away 2-4% of it each year, destroying your purchasing power. Finally, if you WERE hardworking enough to save a million dollars while you are still young, retirement is going to be about as fun as poking bicycle spokes in your eyes. You'll want to start a business. So why wait for retirement?"

I'll have to call a timeout here. First of all, the perspective on inflation is naive. Investors like you and I always take inflation into account when designing our portfolio – as long as you earn more than inflation, your purchasing power increases rather than decreasing.

More importantly, by failing to start their journey by first learning to live happily on a low level of spending, 4 Hour Workweek followers may be setting themselves up for a lifetime of chasing expensive thrills. To focus on earning more rather than spending less is to neglect the fact that we are already living lives of drastic overconsumption. We are already spending plenty of money to achieve happiness – all of us. Let's figure out first how to totally decouple spending level from happiness, and shed the inconvenient burden of insatiability.

Then you can still go out and earn a shitload of money. The difference is that you'll tend to save it and invest it in social change for the better, rather than spending it on yourself.

Or you can keep your existing job, save well, and still end up financially independent and free while you're still young. You don't have to start an online business or do anything particularly crazy.

The original target audience of this blog was the well-paid office workers of the world. I felt that for people earning over $60,000 per person per year, financial independence was already so easily attainable, that it would be an unnecessary distraction to spend years building a second business to increase income still further.

But Tim Ferriss definitely sells the idea well. His book should be viewed as a supplementary course in Badassity, and will be especially valuable to younger people who are near the beginnings of their careers, and also to anyone who is on the lower end of the income scale who is willing to fight to move to a higher level.

Going back to the Twitter comment about MMM and Ferriss – I would agree that we could have a baby someday. The baby would be some kind of hybrid between our ideas. We'd take all of his energy and fearlessness and complete lack of fear of failure. But we'd strip out a bit of the hype and selling, because we wouldn't be out to make money for ourselves – we already have plenty. We wouldn't be creating products to sell. Instead our product would be a globe-spanning breed of supermotivated and ultraproductive Badass People that would be out to save the world.

* Compounding the celebrity intrigue, Tim Ferriss is apparently friends with another one of my much more famous frugality arch-rivals, Ramit Sethi.

Reader Case Study: Getting Blood from a Stone

By Mr. Money Mustache

Wed, 22 Feb 2012 13:00:56 +0000

 The other week while enjoying a day of catching giant fish on Lake Tahoe, I got another interesting question from a reader. I think this one is worth answering online, because the situation probably sounds familiar to many people.

> Hey MMM,
>
> I have a situation that only your level of badassery can cut through. Let's get to it.
>
> 1. I am married, in my late 20s, and employed as a public school teacher.
> 2. My wife is a stay-at-home mom to our newborn baby
> 3. Our only debt is a 38k mortgage (15/yr fixed @ 6.25%) on our home, which is in pretty good shape (i.e. doesn't need any major repairs or upgrades).
> 4. We have roughly 18k in cash on hand with 16k in retirement accounts (401k/Roth IRA/Pension).
> 5. My salary is 50k, which is pretty much the max that I can earn as a

public school teacher.
6. We are cash-flow positive, but not by a huge sum:
a. Charity – $240
b. Mortgage/Insurance/Property taxes – $486
c. Home maintenance fund – $200
d. Utilities (water, electricity, prepaid cell phones, internet) – $275
e. Groceries – $340
f. Auto fuel and maintenance – $200
g. Insurance (life, termite, auto, teacher liability, id theft) – $170
h. Pet – $60
i. Medical fund – $100
j. Misc – $50
k. Child fund – $200 (This is budgeted, not all is spent)
l. Car savings – $100

Total Spending – $2421/month
Income – $2520/month

Note: My wife occasionally makes some extra money from grant writing, and we usually use that for entertainment since it's clearly not present in our base budget.

Basically, we operate under the America's Cheapest Family plan. Each of those categories represents its own budget. For example, our Insurance fund has over $500 in it right now and will continue to accumulate until various debits are applied, such as for car insurance, etc.

I have a very small side business (web design) that I am trying to grow.

I would really like to pay off our mortgage; however, I am struggling with figuring out how to go about it. Do I take a second job? I would say "cut expenses," but I just can't find it in the budget. The "charity" amount is really a non-negotiable for us.

signed,
Troubled Teacher

This is an interesting dilemma, because we have a family who is running a pretty tight ship in my opinion, yet they have no money to spare. The underlying problem is that they have an ambitious plan: a single income earner at $50k, trying to support two other people AND a dog, AND a house and a car.. all with a charity budget that is twice as large as the savings budget.

Let's start with income:
Our friend Teacher lists his income as $50k/year before tax ($4166/month), yet is showing take-home pay of only $2520/month. That implies $1646 in deductions, or 33%. That is much higher than the tax rates I'm familiar with, since using the "married filing jointly" tax status you should be paying 13.3% in federal tax. Even after adding SS/medicare and state tax and assuming a high-tax state like California, I calculate a take-home pay of about $3400 per month.

So there's a thousand dollars a month that is probably going at least partly into pension or retirement savings. That brightens the picture quite a bit, since that's about 30% of what would otherwise be the take-home pay. If that much is really being saved, the simple math behind early retirement puts Teacher at less than 28 years from retirement – before any improvements are made.

And you could definitely use MORE income. As a general rule, I feel that any family earning less than $100k per year would benefit from increasing their income if at all possible. Above that level, there is plenty for both spending and saving for financial independence in a reasonable time frame, so at that point I usually encourage looking to frugality before going overboard searching for even higher income. But for you, some extra cash would definitely come in handy. Your web design side business might be the ticket if you are a good promoter, as would any number of other jobs – especially during the summer if you have the time off like most teachers. Your wife may be able to expand her side hustle business from home as well – during the baby's nap time, or on evenings and weekends and eventually during school hours.

I'm also surprised to hear about the low pay for teachers in your area. This may just be bad public policy that you're stuck with, but you might want to poke around the system for extra pay. I have met many, many teachers from different parts of the US who earn $60-90k by the time they have been working 10 years or so. But if you love the job and there's no way to squeeze out more pay, we can still make it work.

The cash and investments:

You have an exceptionally expensive mortgage at 6.25%. Since it's on your primary residence, you should be able to get this below 4% if you shop around. Due to the small balance, it would be wise to pick a bank that will charge you no closing fees to do the refinancing. You should still do the math on any potential re-fi deal, but going from 6.25% to 4% on a 38k balance will save $855 per year.

Next, **you have $18k in cash on hand. Why??** Even I rarely keep more than $3k in cash! If you dump this immediately into your mortgage, **it will save you $1125/year in interest** at 6.25%, and still $720/year even after you refinance to 4%. You have a stable job, so losing it with no notice is unlikely. If you did lose that job, you'd still have many months of unemployment insurance to back you up.

Keeping $18k in cash on hand when you have that mortgage is exactly like floating a neverending $18,000 cash advance on a 6.25% credit card and then stuffing the money under your mattress. It makes no sense. If you really want financial flexibility, open up a line of credit on your house, keep the balance at zero, and consider that to be your untapped emergency fund.

And the Spending:

You are an efficient family, but in a tight situation like yours it is still worth putting everything up for review. Do an annual shop-around for house and car insurance, and use higher deductibles if practical, since your budget of $170/month indicates you are spending much more than me (my house and car insurance is about $50/month combined).

Your car fund for fuel, maintenance, and replacement is at $3600/year, perhaps double my own spending on cars. This is directly proportional to the amount of driving you do – is the car ever used for commuting trips under 10 miles or local errands that could be handled by bike part of the time? As I've mentioned many times on this blog, **bicycles are rolling cash machines** and I estimate that taking up biking earns and saves about $93,000 every ten years over the long run. Even just using a bike with trailer for grocery shopping would be a good start.

The Pet Budget: At an annual cost of $720/year, I would not consider myself wealthy enough to be hosting dogs and/or cats at your stage, although it is of course a personal decision.

Equally personal is the charitable donations decision. I know you said it is non-negotiable, but just for fun let's plant an idea. You *could* view charitable contributions as a lifelong goal rather than an immediate monthly need. There is something to be said for getting yourself financially established *first*, then using your increased strength to give more later. That was my own strategy – I saved like hell and ignored outside causes throughout my 20s. Then I was able to quit working entirely and now I have both my time and some money available to try to do some good – for the rest of my life!

Yours is not the easiest situation in which to find free cash. But I believe it can be done. Good luck and let us know how it goes!

Pay Down the Mortgage or Invest More? A win/win question.

By Mr. Money Mustache

Fri, 24 Feb 2012 13:18:00 +0000

Another scene from my rental house. It's inefficient, but at least it's paid for.

There’s a thoughtful debate going on right now over in the Money Mustache Forum, where people are comparing different strategies for investing in rental houses.

Some people prefer to save up the full purchase price of a house before plunging in and making the move. Others will make the buy using a mortgage but then pay down the principal as aggressively as possible. Still others will borrow 75% or more of the purchase price, then leave the balance outstanding as long as possible, keeping more of their cash free to make additional leveraged investments.

That’s a landlord-specific example, and not all of us are interested in owning rental houses. But exactly the same thought process goes into deciding whether you should pay off your mortgage as quickly as possible, or pump your surplus cash into stocks and other investments on the theory that the long-term return of stocks is better than the 3.5-4.5% rates that US and Canadian mortgages are currently charging.

It's a complicated question, because to fully answer it you'd need to consider risk, your personality type, how close you are to retirement, asset valuation and cashflow, and even make a stab at predicting the future. But there is still some good news: it's a win/win question since either of these strategies involve YOU putting away money in a productive place, which will tend to make you wealthier over time. The Mustachian Way is flexible enough that it will make us all rich relatively quickly, so there is no need to lock on to one particular strategy as The Only Way To Do It.

But just for fun, let's consider a few different scenarios to compare the effects of payoff and leveraging.

Strategy 1: The Consumer who Thinks he is an Investor
Some of my less Mustachian acquaintances like to talk confidently about the benefits of borrowing money.

> "3.5% is the cheapest money you'll see in a lifetime! I am never paying down my mortgage, I'll just use my money to make more money!"

This statement is correct in general, but the problem is that it is often used to justify higher consumer spending rather than higher investment. Some people who have said this to me have expensive cars (bought on more of that brilliant low-interest credit), powerboats, and lifestyles that burn most of their salary. But their investment accounts are smaller than even the value of the material things they have bought. These people would be much better off paying down the mortgage, rather than buying additional Mercedes and iPads, because they are currently using the leverage afforded by the mortgage to purchase liabilities rather than assets.

To justify not paying off your mortgage, you have to demonstrate a genuine desire to get ahead through investment. That means having low living expenses (let's say equal to or lower than mine), and a correspondingly high savings rate (50% or higher). At this point, I will grudgingly admit that you will probably do much better investing in Index funds rather than paying off your mortgage – we'll get to this in the "Stock Investor" category later in this article.

Strategy 2: The Aggressive Landlord

One of the moderators of the MMM forum is a guy named Joe. He's a fast-thinking, voraciously-reading, fast-typing type of guy who is on the rocket path to financial independence. He correctly calculates that you can make money MUCH faster when you carry a mortgage balance on your rental houses rather than buy them entirely in cash. Here's an excerpt from his explanation, edited slightly for compactness:

> Let's say houses cost 100k each, and you have 100k to invest.
>
> You can put 25% down on 4 houses (25k each x 4 = 100k) or 100% down on one house (100k x 1 = 100k). Houses rent for $1200 per month.
>
> Let's compare the two scenarios.
>
> We'll use the 50% rule, a conservative rule-of-thumb which assumes about 50% of your gross rent will will go towards vacancy, repairs, long term capital maintenance, property management, property taxes, insurance, etc. Mustachian landlords can easily beat this performance, but for now let's go with it.
>
> **Scenario 1:** 100% down, no mortgage payment. You cashflow is $600/month, or $7,200/yr.
>
> **Total for scenario 1: $7,200**
>
> Scenario 2: 25% down, 30 year mortgage.
>
> At current mortgage rates of 5% (current owner occupied is about 3.75%, investor is 5%), your mortgage payment will be $402.62 principal and interest. 1200 rent – 600 to 50% rule – 402.62 to

mortgage = 197.38/mo cashflow per house, or $2368.56/yr. **Times 4 houses = 9474.24**

Already you're making an extra 2 grand per year.

But wait, we are also paying down that mortgage. Year 1, your tenants pay down $1,012.19 per house of mortgage, or an extra $4048.76 that you gain in equity.

Total for scenario 2: $13,523

So you make *almost double* in terms of equity gain + cashflow by having mortgages.

That's assuming no appreciation. If the house appreciates, you gain 4X as much appreciation. If it drops, GREAT, buy more houses! If you aren't buying places where the rents more than cover the expenses + mortgages, don't buy them. Who cares what the "value" is if you're holding long term. Even if you lose your job, you can cover the payments because the renters themselves more than cover the payments!

But that's also counting having someone managing all those properties for you (that's counted in the 50% rule). If you want a side-gig as a property manager, you can save yourself an extra $120/mo on scenario one, or $1440/yr. But if you landlord in scenario 2, you'll gain an extra $5,760/year. Yes, you'll have 4x the work (managing 4 houses vs one), but you have that choice – let them be managed and pay for that, or manage yourself and pick up a few extra bucks than you can in scenario 1.

On top of that, you ALSO get **mortgage interest write-off**. So on top of **2 grand more cashflow**, **4 grand principal paydown**, **4x appreciation potential**, you can write off some of that cashflow. PLUS you'll have **4X the depreciation**, sheltering all that cashflow and perhaps protecting some of your W2 income from your normal job.

Joe goes on to point out that over-leveraging is bad, but moderate leveraging (which we'll define as 4-to-1 in real estate) works out well. But you must you have the personality type to deal with getting loans, and running a business. Real estate investment is actually a business that takes some skill, rather than just a free-for-all form of passive investing. This skill also allows you to avoid buying houses during property bubbles (Joe's analysis would have ruled out the overvalued sunbelt properties that later lost 50-75% of their value in the US housing crash).

But if you develop the skill and understand the numbers, there are few ways to make as much money so quickly.

Strategy 3: The Young Stock Investor

You're just getting started on saving for early retirement. You have a good career that is providing some surplus cashflow. But you are not interested in landlording or you live in Silicon Valley or Vancouver where house prices are far too high to justify buying them as rentals. So you decide to invest in stocks.

Over the long run, people who understand economics will generally agree that stocks will do better than the 3.5% return (before inflation) you get by paying off your mortgage. We'll leave the explanation to the stock market books, but most would predict about 7.5% before inflation* even given today's relatively high stock prices.

Being sure to max out your 401(k) is even more important, especially for those with incomes over $50,000/year due to the benefits of tax deferral and employer matching.

Strategy 4: The Conservative Early Retiree

You may notice that I speak favorably of strategies 2 and 3 above, and I have followed parts of them both over the years and benefited (even while living through the great financial crisis, the US housing crash, and two major recessions). But now I operate on an all-cash basis. I have no mortgage on my primary house, or the rental house, and I avoiding the temptation to borrow to expand my investments further. And many other retirees, both early and late, take the same path. Why is this?

1. **I am a wimp:** I learned during my heavily-leveraged "Big Mistake" business phase that I do not sleep well when things go wrong while there are monthly loan bills that are still due. But I get great pleasure from cashing rent checks and keeping the proceeds entirely for my family. My analytical side knows that I could make much more income through leverage, but sometimes you can afford the analytical side be damned. When? See the next point.
2. **I already have enough income:** Once the groceries and the property taxes and the family trips are paid for, the marginal utility of more money drops significantly. If I had more income, I could spend more, which is definitely not interesting. I could save more, which is slightly interesting. I could *give* more, which is actually quite interesting, but so far I haven't gone so far as using debt leverage to achieve it. I'd rather achieve more on the *production* side of things: working hard on things that force me to simultaneously learn and gain skills, and earn income as a side-effect. Even this blog meets those criteria, although it is heavily tilted towards learning and away from income right now.
3. **Paid-off assets can replace some of the "cash/fixed income" portion of a retirement portfolio:** What is better for a retired person: keeping a $200,000 mortgage on your house and having $200,000 invested in corporate bonds that yield 3.5%? Or putting that cash into the mortgage and just having a more stock-heavy portfolio? In general, the mortgage is better since its return is 100% guaranteed and there are no income taxes on saved mortgage interest.
4. **Nobody wants to lend me money anyway:** During the years since early retirement, and before switching to the current "all cash" model, I decided to refinance the main house and a few rental houses at various times. As the US credit system tightened, I found it increasingly difficult to qualify for these refinancings, despite the fact that I could prove invested assets greater than the mortgage amounts on the houses. This is because most banks are only set up to handle the *typical* borrower: someone with lots of income, and negligible assets. When they see that my income is relatively low compared to the value of my house, they assume that I could never handle paying a mortgage.

> So I had to do much more paperwork and work with special lenders to do these refinancings. Mustachians tend to blow the minds of the regular world, because our spreadsheets do not work the same way their spreadsheets do.

In the end, I respect the power of leverage, but I also came to appreciate the Peace and Quiet of Cash. But that doesn't mean you can't take a totally different strategy!

* for the S&P500 calculated roughly as: 2% current dividend rate+3% inflation+2.5% real GDP growth rate. Don't go crazy writing comments to me about how optimistic this is, I'm just repeating the orthodox view that economic experts (including Warren Buffett) tend to have of long run stock performance.

Get Rich With: Good Old-Fashioned Hard Work

By Mr. Money Mustache

Mon, 27 Feb 2012 12:58:21 +0000

 the Tim Ferriss book. In the reader comments that followed, there was lots of agreement but also some Tim-bashing, suggesting that he advocates taking unethical shortcuts and shunning real work.

While it's easy to misunderstand what Tim was getting at (he's actually a *ridiculously hard worker* and I later got to know him a bit better through an appearance on his podcast), these readers still had a good point. And this has reminded me to write this article, on a topic I have long wanted to cover: **Working Really Hard**.

Sometimes on this blog, you'll hear me celebrating the idea of leisure. In the very first post, I talked about hanging out at home on a sunny Thursday morning while everyone else is at work, sweeping a few leaves off of the driveway in my pajamas. Other times I'll talk about kicking back with a deluxe home-brewed beer or catching giant fish and snowboarding in exotic locations.

It would be easy for an impressionable youth to see these decadent displays and latch onto them as the end goal.

"How can I take a shortcut to get what Mr. Money Mustache has?", they would say. ***"I want that end result, and I'm willing to do any sneaky hacks I need to, to get it."***

So today I'm going to shatter the illusion I have built up about my easy life. But don't worry, it's not a bad thing. It's actually a piece of even better news:

You too can have the lifestyle of your dreams. And to get it, you will need to do *an absolute shitload of insanely intense, ball-busting work.* And here's the best part: *the insane work will bring you just as much happiness as the leisure time!*

So you get to achieve whatever you want, and you get to work really hard for it. Isn't that great news?

Despite the fact that I sometimes talk about not working, I have actually grown to *really love* hard work. But it was only in the last few years that I realized this.

Ever since I hit first grade and was fortunate enough to be placed in the top reading group, I have been hooked into hard work. Not realizing there was any other option in school than to get all "A"s on the report card, I naturally did whatever amount of stupid busywork and coloring, repetitive addition and subtraction, and putting up with irrational rules, to get the perfect grades. Growing up through high school, I attended all the classes and did the necessary ass-busting to get the grades that would grant me university admission and eventually graduation. At the time, I thought I was enduring a wasteful hardship, but really there was something else going on in the background.

On the side of all this school work, I signed myself up for a second line of work in the pursuit of cash. With frugal parents that didn't believe in giving their kids a free ride, I was forced to work for any money I wanted for myself. Starting at age 10, I cut the grass and washed cars. At age 12, I started working on their old Victorian house, stripping old paint from the massive front porch* and doing other projects which culminated into building my own bedroom in the attic at age fifteen.

Eventually, I advanced to a cushy minimum-wage job at the busiest gas station in town, pumping about 4,000 gallons of gas into rusty old Chevrolet Caprices every day, then moved up to a less chaotic gas station, then a hardware store, then a convenience store. Then engineering jobs between school terms (even over the Christmas holidays once), then full-time engineering work including many weekends and evenings, then even the construction and blog-typing work I'm doing to this day.

There have been many times during this history of work, where I have thought that I had it pretty hard. When I had to spend entire days on the university campus in the dead of a freezing winter, trudging through the snow with inadequate food and non-waterproof boots from the 8:30AM calculus class, to the 9:30AM chemistry class, on and on right through to the 8:00PM physics mid-term exam, all while being surrounded by a class of Engineering students with far too many nerdy and quiet dudes who never made jokes, and far too few beautiful girls, that was pretty tough.

Whenever I'm upside down with my head and one scratched and filthy arm stuffed into a floor cavity, holding a grinder which is spinning an abrasive blade cutting off old nails and plaster so I can remove a wall or a ceiling, and the whole scene is a dark din of Vietnam-style dust, sparks, and shouted expletives, I sometimes think that work can get a little unpleasant as well.

But as I've gotten older and made the connection between the hard work, and the results, and the constant learning and deep base of happiness it seems to provide in ever-increasing quantities, I have come to realize something I wish I could go back and tell myself at age fifteen:

> **Every single second of hard work you perform in your life, will come back and benefit you many times over for the rest of your life – in often unexpected ways.**

In other words, no hard work is ever wasted. It sounds ridiculous, but I find it to be ridiculous how often this proves to be true.

One time I hit a serious roadblock when building my first house. Because of the architect missing some obscure rules about fire codes and roof venting, my house was not going to pass the "framing" stage of the building inspection. There was a workaround, which involved paying an extra $5000 to have an insulation company install a special kind of spray-in insulation. My business partner Dean wanted to take the shortcut and just hire the company. The other option was for me personally to spend the entire weekend meticulously cutting and gluing up strips of rigid foam-board insulation to every square inch of a high vaulted ceiling.

"Fuck the $5000 expense", I said, "that's not in the budget. We can crank out the fix this weekend, and only spend $300 in foam board instead of five grand for the spray".

Dean opted out of this task, since he always liked to take weekends off to relax. But luckily I had another hardworking friend who helped me out and we got the work done, saving over $4000 even after paying ourselves well for our labor.

The work sucked at the time. It was dark and cold working in that house shell in late November, I missed my wife and newborn baby, and I got coated in filthy powder from the insulation. I questioned my own wisdom for taking on the extra task. It was only money after all.

But it wasn't only money. Over the subsequent years, the information I was forced to learn about roof venting, foam board insulation, fire codes, building inspections, and a dozen other things from doing that work, have enabled me to solve countless other problems in home construction and energy-efficient design. Solving these other problems has brought in even more knowledge, and opened up a whole new section in my mental toolbox that I get to use for figuring things out in many areas of life.

And the shared experience of completing the shitty work together helped to build a longer-term friendship with Mike, the rockstar friend who helped me with the work. This guy is still out there succeeding, and probably even reading this alongside you since he is a practicing Mustachian. And when I look around at other friends who survived the Great Recession while keeping their businesses alive and their base of friends intact, it is always the ones who were willing to sacrifice a weekend to, figuratively speaking, glue up their own damned foamboard to solve life's little emergencies.

Meanwhile, Dean ended up crashing himself into bankruptcy, mostly because of his aversion to hard work.

And that brings me to my next point: Shortcutters like my old business partner were often excited by the idea of making money without doing work. I have always been more interested in the idea of doing work, and making money from it if possible. He always talked about how our business profit sharing should not be based on how many hours we contributed. I felt that it should be, since with hard work comes accomplishment. It led me to create this Mustachian Maxim:

In the long run, in the Game of Life, we all get Paid by the Hour.

There are a few lucky exceptions, like the kid who gets a trust fund or inherits his family's business, the early employees in a company that eventually goes public, or the guy who gets famous for doing something stupid on YouTube. But when you're starting from scratch, you need to think of every hour of work you do as **planting a seed** that will bloom at some unpredictable time in your future life. Sometimes it looks like successful people never do any work. Most of the time, it is because they have respected hard work all of their lives.

Tim Ferriss often praises the idea of minimal working hours. But if you look at how he arrived at the Four Hour Workweek, it was through years of extremely hard work, research and testing, and 80-hour workweeks. During those 80 hour weeks, he thought he was just wasting his time and answering customer and supplier emails and phone calls. But really in the background he was learning very quickly about how businesses and people work, and being forced to devise a system to take himself out of the loop. Without the 80 hour workweeks, he never would have been pushed to innovate, and we never would have heard of him.

Bringing all this back to the Mustachian way of life, this is why I am always advising you to work hard in your day job, but then also come home and take care of your own kids, clean your own house, cut your own grass, and spend the remaining time reading books or websites – to research things that are of interest to you. With no passive television watching allowed.

By doing all of these things, you're actually working and learning *all the time*, without realizing it. Your mind is making unexpected connections between things you did during the day, things your kids said, things you read at night, and they are forming into new ways to make yourself happy, or to start your own business and earn more money, or to save money on some aspect of living, or get life in general figured out.

Hard work can be painful, but it should always be viewed as a good kind of pain, just as you celebrate a good burn in your biceps and forearms when doing a record-breaking set of concentration curls. When you find really enjoyable work, you can get many of the same benefits without as much pain. But both kinds are to be welcomed. It is the source of growth in your life.

So get back to work!

—

**which, looking back, I now realize was surely lead-based paint. Nowadays we don't let our kids play with that stuff and we make painters wear plastic space suits and ventilators just to handle it. Ahh the naive ways of the 1980s.*

Challenge: Who is up for Maximum Mustache March?

By Mr. Money Mustache

Wed, 29 Feb 2012 13:00:17 +0000

start getting your groceries with a bike trailer, was way back on October 20th. And even that one was a bit of a cheat for me, since I didn't have to change anything in order to meet it (although I'm still proud to say I've made only one car-based grocery trip since October 20th – due to needing supplies for an impromptu party in January immediately after an 18″ snowfall in my area).

So anyway, over in the Forum, someone came up with the idea of this March becoming "Mutilate the Mortage Month". We agreed to broaden the idea to include non-mortgage-holders and hardcore mortgage leveraging investors, and thus we settled on Maximum Mustache March.

So here's the deal:

For just one month, find a way to increase your hardcore focus on monetary efficiency, boost your badassity, and supercharge your 'stashing. Cut your spending in novel and healthy ways, and see how well you can do. Reducing total outlays by 10% is a nice goal.

My personal goal is to up my game in healthy cooking for the family in a strategic way that allows us to spend at least $100 less on groceries for the month. With an average that had crept up towards $400/month throughout 2012, I'd like to keep it well below $300 this month with a goal of $250. This means eating less meat, and more things that are lower in cost on a calories-per-dollar basis. Spicy bean and rice dishes, an Indian vegetarian curry recipe, the occasional baked potato with cheese and chives, and plenty of fresh fruit come to mind. The remaining meat dishes can have more things like grilled tilapia, which is cheap and yummy, instead of organic beef and chicken, which is expensive and yummy.

I'll also make a point of taking on one extra full day of paid work in my construction business (which will be nice since I've been a bit lazy since finishing the Foreclosure Project). This will add a few hundred dollars to the family income for the month.

Other ideas for setting a new record in your own performance this March:

- Make it a "buy nothing month", where you eliminate all optional purchases except groceries. It's okay to make exceptions when needs come up (prescriptions, things for kids, fixing important things) but gadgets and wardrobe upgrades are *out!*
- Take the "One Tank Challenge" where you fill your car's gas tank before the month begins, and make it last through all of March. This would be too easy for for the MMM family, so we could shoot for a "One Gallon Challenge" – driving less than 40 miles in our 40MPG car – instead. But with a family camping trip already planned, we might have to apply the challenge only to the portion of the month we are in town.
- Get new quotes on your house and car insurance to see if you can drop the rates. See if you can beat the ones we're getting as mentioned in the new "MMM Recommends" page.
- Set a goal to ride your bike at least 100 miles (3 miles per day) during the month – for work commuting or errands.
- Consider switching to a new cell phone plan or internet plan that meets your needs at a lower price. Some neat ideas came up in this forum post on that subject.

These are just a few ideas out of thousands of ways to improve your bottom line. Then you take all the profits and roll them into either paying down your highest-interest debt, or investing some other way into your Early Retirement Fund.

And there's actually something quite tricky about this challenge: I am fooling you into thinking this is a one-time exercise, so it sounds easy. But really, trying *any* of these things where you push one of your boundaries, will automatically result in new frugality skills. You'll find that a portion of the new behavior just sticks, effortlessly, and you will benefit financially from the new skill for the rest of your life.

In my own case, I'll learn a bit more about affordable cooking, with a new recipe or two to go with it. That knowledge will help me spend less on groceries, forever. And I'll invest 100% of the extra few hundred I earn from my day of work, resulting in a higher stream of passive income, forever.

Yahoo! What will you do with YOUR Maximum Mustache March?

Reader Case Study: Harvard Law Superstar or Family Man?

By Mr. Money Mustache

Fri, 02 Mar 2012 13:00:49 +0000

Many of our reader case studies have profiled people who are earning an average income, and looking for ways to make the most of it. They want to pay off debts, support a family, and save for eventual financial independence.
Today's story comes from another side of the spectrum: a recent Harvard Law School graduate who is now making some serious dough, which comes at the cost of very limited time to spend with his young children. There's plenty of money to go around, but it turns out that money isn't everything. Let's check it out in detail:

> Hi MMM,
>
> Your column has truly changed my life. Before I started reading it, I thought I was doing well by putting about 15% of my income into a savings or brokerage account. Now, I know better. But I need (want?) some advice. I am a recent law school grad. I am currently working in a "Biglaw" (tall buildings and large clients). My current firm has some nice benefits. But, I do not see my wife or kids nearly as much as I would like to. So, here's my question. Should I stick it out in Biglaw for a couple more years until I am FI (or at least debt free), or

strike out on my own and gain some flexibility in my schedule? I love the idea of early retirement, but not at the expense of my relationship with my family. (My wife and I are 28, our kids are 6 and 3). Here's the financial picture:

Salary: $210,000

Assets:
Home- $380,000 (with a $311,000 mortage at 4.5%)
2 cars- $32,000 (with $21,000 in loans at 1.9%)
A bunch of other crap- about $1

Liabilities:
Student loan debt- $240,000 (interest rate 6 – 6.5%) (ouch!)

Monthly Expenses:

Mortgage/HOA/taxes- $2,800
Student Loans- $3,000 (my law school will pay these for me if I start my own firm and don't do well)
Utilities- $200
Cable- None!
Internet- $55
Cars (auto loans, insurance, gas, maintenance)- $1,200
Cell phone- $25
Entertainment (e.g. eating out, movies)- $200
Misc (food, clothing, everything else.)- $600

Total: $5080 of living expenses
Plus $3000 in student loan principal+interest repayment.

More Details:

We live in a high-cost-of-living area right now. The $380,000 home is a 1300 square foot condo (in a great school district).

I started at Harvard Law already in the hole from college. When I started, tuition alone was north of $40K/year. After I graduated, My

> total student loans (college plus law school plus principal due to deferred interest) was around $250K. HLS was a great experience, but I sometimes wonder whether I should have gone somewhere on scholarship.
>
> We live in the DC area. I bike to work when it's not raining/snowing/below 40 degrees (I know I'm a wussypants!). It's about 6 miles each way. My wife is now getting her own law degree at a local university, so we can't easily move out of the area.
>
> Starting my own firm would take away the student loans (unless I do really well), and would drop my car expenses from $1,100 to $300/month. It would also mean giving up the high salary and benefits. My projections are that I could earn between $40,000 and $60,000 in profit in the first year, and probably stabilize around $100,000 after 3-4 years. So the pay cut would be significant.
>
> So, here's the big issue. I could obviously reach FI far faster by staying in the firm. But, that means giving up on seeing my wife and kids in a meaningful way until I get there. Alternatively, I can start my own firm where I would work really hard but have a more flexible schedule. This would push off FI, but allow me to see my family. What do you think?
>
> – Dave in DC

To me, this seems like an interesting story to publish here, because it directly addresses the tradeoff of Time vs. Money that all of us will have to make as we advance further along in the process of becoming wealthy.

When you have a severe shortage of cash, the needle usually points to "Money". But what about this guy, has a choice between earning *a Whole Lot* or just *a Lot*, but also has high debts? And all of this is set against the backdrop of a ticking clock that cannot be stopped. Those kids are on their way to growing up – do we miss their childhoods in search of a higher income?

When it comes to work/life balance when kids are involved, Mr. Money Mustache stands clearly on the side of "Life". Not everyone feels that way. But I think you could have predicted that I would say it, because Mrs. M. and I retired from work specifically to start a family, and we regularly turn down moneymaking opportunities to stick to that ideal. From what Dave has told me – in this summary and in another private email, I know that time with his kids is very important to him.

So our goal in crafting the advice is this: make him work in the high-paying job only long enough to ensure financial stability, then let him come home to his family, set up a law office in the spare bedroom, and start living life his own way.

This means that the standard Upper Class East Coast lifestyle for this salary range has already been ruled out: upgrade the cars and house, enroll the kids in ivy-league private schools, take a liking to $50 bottles of wine, and be locked in to working forever.

But right now, I still see some trouble. Those monthly costs are enormous, requiring a $60,000 take-home pay just to cover them – and that's even after the nifty feature of the law school temporarily taking over the student loan payments. To get out of your situation, you need to cut your monthly expenses to a level where you can easily afford them even while starting your own business.

Step 1 – costs:
The Cars: You have duly apologized to your fellow Mustachians for financing two brand new cars while simultaneously owing money on your education and your house. That's a good start. You pointed out that your car costs will drop once you stop commuting to work, but guess what? We can drop 'em right now instead!

First of all, both financed cars need to go – you can't afford such expensive cars when you're in debt, although you will be able to in the future. Since you live only six miles from work, you can easily drive a very old car and still not run into frequent maintenance issues. With low annual mileage, you don't need to carry a lot of vehicle inventory. Similarly, your wife can choose a second affordable car if needed that suits her own requirements.

These steps should drop your car ownership costs to the $300 range right away, with no car loans.

The House: You have listed $2800 in monthly housing costs, yet the mortgage payment on a $310k mortgage is only $1570/month. I find it amazing that the taxes, HOA, and insurance on a condo add up to $1230 per month. But if it's true, you might want to look around at the rental market in your area. Can you get a similar house at a lower monthly cost by renting? If so, you should consider it! There is no shame in renting in a high-cost market like yours if rentals are a better deal than housing. This would also free up most of the $70,000 in equity you currently have in the house, to eventually be used to pay down debt.

The Other Costs: the rest of your budget looks pretty reasonable for a busy family. You could always tweak your entertainment and restaurant budgets to give yourself more breathing room (remembering that even though I am typing calmly to you to avoid making you spill your coffee, you are actually in the middle of a ***<u>DEBT EMERGENCY!!!</u>***). Although you'll maintain the composure of a calm husband and father, there should be a constant Red Alert Siren playing at least somewhere in the distant background of your head at all times. So let's assume we can get your $5080 in living expenses down to $4000 per month.

Step 2 – the Job

Now that your budget is streamlined, how can we leverage that kickass job you have acquired for yourself? This is the happier part of the story.

With an income of $210,000, you are theoretically taking home about $140,000 after federal and state taxes, social security, medicare, etc. This will further get sucked into:

$48,000 living expenses
$36,000 student loan payments
Total: $84,000

This leaves a net savings of at least $56,000 per year. Plus $20,400 of your student loan payments are actually principal, as well as $5,000 of the mortgage payments. Adding in some allowance for the tax deductibility of your 401(k) plan, and the home and student loan interest, your net worth while working will increase by about $100,000 per year.

With a current net worth (after ditching the borrowed cars) of about -170,000, you'll be wiping out more than half of your your negative value after one year, and if you work two years, you'll be at the breakeven point. There will still be a mortgage and a student loan, but the combination of home equity and retirement savings minus debt would add to roughly zero.

All this is good to understand, but it's still not a plan of action. So how about this one:

Get a digital countdown clock, set it to one year in the future, and stick it on your fridge. Tell your family that's the countdown until Dad comes home. Cut your budget in whatever way you can – including moving to a rental house if that is practical. Continue to work like crazy as you currently are, and put all your surplus monthly cash into the mortgage (or into a somewhat liquid investment if you decide to rent).

Near the end of the one-year period, visit a high-quality lender and set up a home equity line of credit for your house. Since the balance will be lower by then, and you'll be further along in your career, this will maximize the size of loan you will qualify for.

When you're all ready for it, make the jump and start your own law practice. If you can get things started on the side even before quitting your real job, that's even better. You'll have $4,000 per month of outlays to cover, which you'll have to meet with a combination of your new income, and your home equity line of credit as needed. Things will be exciting at first, but I have faith in your ability to get this done. Compared to graduating from Harvard Law, making $4,000 a month will be a piece of cake. As your practice grows and thrives, you'll be phased back into making student loan payments, but that's all in a day's work for a Mustachian.

This advice may sound a little crazy to those who love high incomes, but for some of us, things just change when you have kids. If Dave has a chance to control his own schedule to make more time to be a Dad, and do something he loves more than working a high-demand office schedule, he should take that chance. It will take him a few years longer to reach financial independence, but he'll have a chance to more than double the amount of time he spends with his kids while they grow up.

Also, funny things happen when you start to do your own thing. The business may take off. His wife will graduate with her own law degree and there may be opportunities to collaborate for the ultimate flexible family practice – two workers, part-time. This will speed up the saving process and work will become completely be optional long before those kids finish high school.

So I wish you all the best! In one year's time, I'll be standing next to your fridge counting down alongside your family, so please ensure you have it stocked with beer for my arrival.

Guest Post: Shaving Lessons from Grandpa Money Mustache

By Mr. Money Mustache

Sun, 04 Mar 2012 04:48:19 +0000

Keeping our tradition of occasional words of wisdom from readers on the weekends, I thought I'd share this educational article my Dad sent me some time ago on the topic of shaving.

I covered my own take on the issue long ago when introducing what I like to call the Universal Men's Grooming Device. But it seems that some of the Mustachian Men have situations in their life which do not allow the permanently prickly chin that I advocate myself. So they must find a way to get a smoother shave that the UMGD will provide.

This is where my Dad comes in – the man who inadvertently started the Money Mustache Movement by demonstrating a rational and efficient lifestyle to his own kids. He's also a retired advertising writer and plays a mean jazz piano to boot. This is why he is effecively Grandpa Money Mustache to you – so shavers, listen up:

(a quick note on the tone of the article – this piece was originally written for a man-oriented magazine or newspaper, rather than specifically for me to post on this blog.. which is why it is a bit more sassy than you might expect from your grandpa)

—–

Shaving lessons

I started with an electric shaver but at some point in my twenties, perhaps bewitched by the sexual promise of Gillette TV commercials, tried a safety razor. It left my skin as smooth as the ultimate I'd felt – a woman's breast. Switcharooney time!

This was in the sixties, when "Gillette shaving technology" (quoting from their current labeling) was still in the lab. Guys wanting to "man up" had to settle for a decades-old device: a "safety" razor that held replacement blades (those thin, hard-to-handle, cut-your-fingers-to-shreds blades now made mainly for drug dealers, judging from all those TV scenes in which bad guys use razor blades to cut up cocaine on tabletops).

In 1971 the new shaving age cut loose with the disposable cartridge that boasted two built-in blades. Safer sure, but the ads didn't talk about that (probably too unmanly – who's afraid of a big bad cut or even a gash spurting like a fire hose?). Instead, they hyped the shaving action: the first blade pulls the whisker into position; the second blade slices it off nearer the bottom for a closer shave (i.e., you'd be smoother – and sexier).

The multi-blade rationale evolved into a fuzzy "more is better" mantra as along came the three-bladed, the four-bladed and finally (no, temporarily), today's five-bladed cartridge.

Prices have ratcheted up with the technology, natch. Which has made the mood at the store shelf highly intimidating.

Five-bladed cartridges are about twenty bucks for a package of four. My guess is they're suggesting four is a month's supply and, standing there beside the shelf, I imagine hearing a jingle over the store's P.A. system:
Use one per week
Don't buy less
Or "I'm a schmuck"
You will confess

And at my local drug store, the shelf signs add more pressure. ”Lift here,” it says on the clear plastic lid over the shelf with five-bladed cartridges. But another sign nearby says, “As a security precaution, an alarm rings when the lid is lifted.”

This is just an academic concern for me since I’ve never lifted that lid. I buy the cheap (and hence unalarmed) no-name brand twin-bladed cartridges. Thank you, fellow shaving Luddites, for supporting this antique technology.

I’ve been a twin-blader ever since they introduced three blades. I recognized instantly that this was not about my facial comfort but the financial comfort of the cartridge-makers.

There are ways to fight back. Aye, laddie, grow yer beard! I had one for quite a while, but not just to cut
costs. It’s one of the few things men can do that women can’t. (Or couldn’t. These days I admit to less and less certainty about gender differentiation).

My beard needed only a light trim a couple of times a week. One shaving cartridge lasted for months.

After my first marriage ended, I “disappeared” my beard to help me attract a new mate. This worked and I am still beardless, at her preference. This presents no financial problem thanks to my manly money-saving moxie.

For instance, I discovered that even with daily use, disposable blades work longer than the manufacturers want you to believe. Just keep using ’em until you don’t (or she doesn’t) like the feel of what’s left on your face. I’ve been doing this for years and have never been thrown out of bed.

Also, I switched from shaving foam (now $3-$5 a can) to shaving soap. You need a brush to lather up but a brush isn’t your typical repeat-purchase item. I’ve had mine, a very basic model, for over a decade.

The stores fought back by stocking less shaving soap. Eventually, the low-priced brand I was buying vanished.

I experimented with good old Ivory soap. Mirabile dictu, it works just fine.

No, it doesn't come in a shaving mug, but that leads directly to my last discovery: no mug needed. Just swipe a wet brush a few times over the bar, transfer foam to face, lather up and voilà – shaving for the new age of discerning the dollars (it used to be "pinching the pennies," but you get the point).

The final word on the cost of shaving has to go to the Chairman of the Federal Reserve. Ben's beard is obviously a coded message that men don't need to cut their whiskers. Just their whisker expenses.

P.S. My wife still strokes my cheek.

So I Bought you a $40 Light Bulb Today

By Mr. Money Mustache

Mon, 05 Mar 2012 13:00:04 +0000

 this earlier article about electricity).

By accomplishing this, you'll end up about $13,000 richer every ten years.

A big part of the savings comes from angrily smashing up any of those ridiculous incandescent light bulbs you have remaining at home, and replacing them with Compact Fluorescent bulbs (CFLs).

But although CFLs are clearly a huge win over incandescents, and they are cheap at under $1 per bulb, they still have some weaknesses:

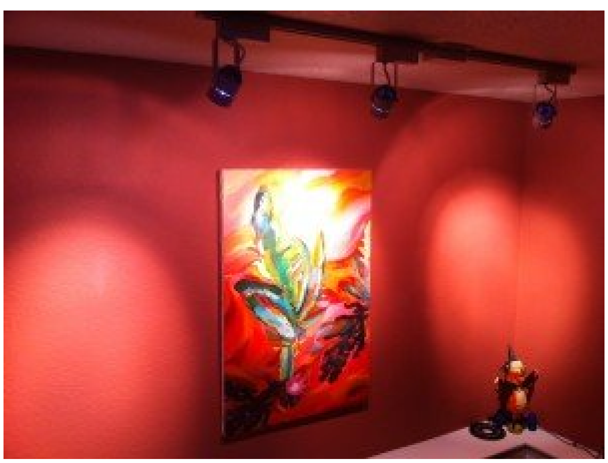
- They are not dimmable (unless you pay extra for a special type that approximates dimming)
- They do not immediately reach full brightness (modern ones are usefully bright within one second, although certain in-ceiling reflector ones take several minutes to warm up).
- They contain a small amount of mercury, so if you regularly smash them and snort lines of the resulting powder through your nose, you will exceed the federal recommendations for mercury intake (although they are not at all dangerous in normal use)

- They provide omnidirectional light, which is great for lamps and exterior lighting, but not great for kitchens and track lighting.

The last point is most significant to lighting fanatics like myself. To get really good lighting inside a house or business, you need focused, narrow beams of light which illuminate the highlights of a room, rather than just ceiling-mounted lightbulbs randomly scattering light in every direction. Think about the feel of an gallery, an expensive clothing store, the Whole Foods produce department, or an Apple computer store. These places use halogen track lights which provide a focused beam of bright white light. Now think about the feel of a Walmart or a Home Depot. Those ones use long fluorescent tubes or sodium lamps with no focus. It's the direct and high-contrast lighting in the nicer interiors that makes you say, "Ooh, nice".

"Ooh, nice" is an important goal, and not just for pleasing your own aesthetic senses. It translates directly into profit if you own a business with a space where customers visit, if you're a landlord hoping to increase demand for your apartments or houses, or even if you're a homeowner selling your place to move somewhere else, and want the house to sell quickly at a high price.

Check out the next few pictures to compare the effect:



[This track light with halogen bulbs in my basement staircase creates accent areas on the painting, walls and shelf to make a more interesting scene]

This sample scene in my testing area is lit up with the yellowy light of an incandescent bulb.

Here’s the same scene lit up with a “warm white” CFL bulb. Note the more reddish hue (which I find a bit nicer) and the continued wide light dispersion.

Here's the scene lit with a brand-new LED bulb (color temperature a slightly cooler 3000K, but still called "warm white"). Contrast and shadows are sharper, scene is classier.

So in my own house, I use Compact fluorescent bulbs whenever I can, but there are still about 20 halogen bulbs in strategic locations such as the kitchen where I like really good classy light. (I'd prefer to use halogen everywhere, but then my power bill would go through the roof).

These halogen bulbs, while better than plain old Incandescents, still burn a lot of power and generate waste heat. A typical halogen uses 50 watts of power, compared to the 13 watts of a CFL bulb.

Recently, however, a new type of light bulb has become available that offers the best of both worlds: the LED.

Five years ago, the first LED bulbs hit the stores. They promised very low power consumption, which they delivered. But this came at the price of a low light output that came out in a deeply eerie bluish color. I bought two light bulbs of this type in Costco at the time, and was immediately disappointed – they weren't nice enough to use in the kitchen or even an office. I relegated them to my upstairs staircase landing, a place we rarely hang out, and we call it "the Blue Zone".

Here's the oldschool LED bulb in my upper staircase – note the many individual LEDs and the bluish hue. Newer bulbs use just 1-10 kickass LEDs instead of dozens of weaker ones.

More recently, LED bulbs have advanced to be much brighter and with a nicer light color. This is why you see them being used in the headlamps of fancy cars, and they are even creeping into the art galleries and expensive stores. The better LED bulbs also appeared on the shelves of Lowe's and Home Depot, where I started tracking them two years ago. The price of the best ones started out at a punishing $80 per bulb and has now ticked its way down to $39.99 for the big "PAR38" reflectors, and $20 for the little "GU10" track light bulbs. Looking at demonstrations of these newest bulbs, I noticed they very closely approximate the quality of halogen lights. Finally! In the near future we can all have great light quality AND low power bills, combined with bulbs that are **dimmable**, and last an entire generation (they have a 25 year life expectancy based on regular service).

Update: *four years later, the prices have completed their amazing drop – amazing LED bulbs are now under $10 each and you can just upgrade your whole house and be done with it. For recessed lights, I highly recommend* *[these Hyperikon bulbs](#) at Amazon. With that update out of the way, you may now resume reading my outdated article on the technology.*

With the prices dropping so rapidly, I would normally hold out a couple more years before buying into a new technology. Although these bulbs save money compared to halogens, the annual price drop is still greater than the annual electricity savings, so it is better to keep wasting power with halogens (while continuing to use CFLs wherever possible) until the equation reverses.

But being Mr. Money Mustache, I now have the responsibility of reporting energy-saving developments to YOU. On top of that, this blog is now making a few bucks a day, enough to justify purchasing supplies for research projects like this one!

So I bought one of the big $40 PAR38 bulbs and brought it down to the MMLL for evaluation. That is of course the Money Mustache Lighting Laboratory, which is really just a desk in my basement where I set up a light fixture, a power consumption meter, and a light output meter that measures light intensity in Lux (equal to one Lumen per square meter). I took down a fleet of my existing incandescent, fluorescent and halogen lights for comparison with the new LED bulb (shown below), and here are the results.

Update! After publishing this article, I mentioned it on Twitter and it was in turn quoted by a Brooklyn, New York company called LED Waves. I looked these guys up and noticed they had pretty fancy LED bulbs as well, with the added twist of being manufactured right there in Brooklyn. I suggested that they send me a couple of their highest-end bulbs for evaluation and was pleasantly surprised to see that they did. So I'm now running a pair of their "New York" Dimmable LED PAR38 bulbs as part of the MMM family's living room, and I also added their results to the table below. Here's what those beauties look like:

I ordered the 8 degree beam angle, which is *much* narrower than anything offered in the big box stores. This concentrates the light in a smaller area, which is a nice effect in my own living room, because I have high recessed fixtures in a 9-foot-high ceiling. By the time the light from regular bulbs reaches the floor, it is quite diffuse. From these 8 degree angle bulbs, I get some nice contrasty sunshine patches on my floor, along with a still-good amount of scattered light out to the sides. You can see how that measures out in the "brightness at beam center" result below, which is over 3 times higher than other bulbs.

Power consumption was also a pleasant surprise. I measured these bulbs at only 10 watts, significantly lower than their 14 watt spec. But because of the focused beam, the usable amount of light is almost as much as the 24 watt LED bulb from EcoSmart, at least for my own purposes. The efficiency really shows up in the "lumens per watt" measurement. This bulb is almost doubling the efficiency of the other LED bulb, and of CFLs as well! The 14 watt savings works out to about 15 kWh/year ($1.50-ish) at 3 hour-per-day usage.

They also take their light quality much more seriously than other manufacturers – check out this detailed spec sheet on the New York bulb.

The only drawback? The price of the dimmable model is $99, and non-dimmable is $74. Would I pay the extra $34 for the better light quality? For the two most frequently used bulbs in my living room, I would probably say yes. For a big array lighting up my infrequently used basement rec room – no.

Bulb Type	Rated Output (Lumens)	Efficiency (Lumens per Watt)	Peak Brightness at beam center (LUX) @ 4ft distance	Light Quality
EcoSmart LED bulb (24 watt PAR38 shape for large in-ceiling recessed fixtures) ($40/bulb)	1300	54	1820	Sweet. Extremely bright and fairly focused beam.
LEDWaves New York LED Bulb	958	95	6000 (!)	Even better than the other LED bulb - subjectively, the hue was more sun-like, but that could also just be the more focused beam.
Compact Fluorescent Reflector bulb (24 watts, same shape) ($10/bulb)	1200	50	360	Not bad, but wide beam
PAR38 Halogen spotlight, 50 watts ($7/bulb)	850	17	1020	Super Sweet. Slightly more yellow than LED bulb. Similar focus

Bulb Type	Rated Output (Lumens)	Efficiency (Lumens per Watt)	Peak Brightness at beam center (LUX) @ 4ft distance	Light Quality
Cheap 65 watt builder-grade PAR30 incandescent reflector ($1/bulb)	580	8.92	230	Much more yellow than halogen, wide and unfocused beam. Similar quality to CFL above, but less bright.
Stupid 60-watt standard incandescent bulb	520	8.67	130	Dim and tragic light in all directions
13 watt CFL bulb	825	63	130	Slightly less yellow and more reddish light than standard bulb. Nicer, but still tragic compared to reflector options.

The things to note about these results are:

- Halogen lights are already almost twice as efficient as junky incandescent bulbs, even while delivering better light.
- CFL and LED bulbs are about **six** times more efficient than the incandescent bulbs, and four times better than halogens. (The higher-end LEDWaves bulb is even higher, in an efficiency class by itself.
- The brightness at the center of the beam, which is a key measure of lighting niceness, is much higher in halogens and LEDs than in the other types.
- If you care about light quality **and** power consumption, LEDs are the only choice.

- If you have recessed in-ceiling lights in your house right now and have never thought about your light bulb choices, you are probably using the "Cheap 65 watt builder-grade" bulbs above. These are an awful choice, because recessed lighting is often done with many fixtures. It's not uncommon to have 600-1200 watts of light burning into a single large room. Switch 'em out for CFLs for maximum savings, Halogens for medium savings and maximum light quality, or LEDs for the best of both worlds but with high upfront costs.

—

So there's my full report on this new technology, just in case you had never heard of it, or if you had and were curious about the performance. I feel that LED bulbs will completely replace compact fluorescent bulbs within the next ten years, since they are better in every way. Besides the reflector-style ones reviewed here, they also come in standard round shapes for lamp applications, as well as specialized ones for smaller lights and even car interior dome lights (so you can leave your interior light on accidentally for a month without running down the battery!).

But for now, they are only for the truly hardcore lighting enthusiast, since the prices are still dropping rapidly. My new 24 watt LED bulb will save me about $5.50 per year in electricity over an equivalent-brightness 75 watt halogen bulb. That's a 14% annual return on investment, which sounds good until you realize the price is dropping more than $5.50 per year. For maximum savings, it's best to stick with the alternatives listed in the bullet points above for another year or two. But keep your eye on these new beauties, since they will soon become affordable for all.

If you're already plenty wealthy and are looking for a fun MMM-approved way to spend a few hundred bucks, I give you permission go out and outfit your whole house with LED bulbs. If you select the "Warm White" color, and go for the highest lumen rating you can find of each shape, you'll be pleased with the results. And you'll be helping to save power and boost the industry to help bring the prices down for the rest of us. As I said, even at current prices, they're a roughly 14% annual return on investment*, which is better than a punch in the face.

*assuming a 3-hour per day run time and 10c/kWh electricity. You can then scale your own ROI directly if your numbers are higher or lower. For 6 hours or more per day, the LED is an even more obvious win, and it becomes cost effective to upgrade immediately.

Frugality: the New Fanciness

By Mr. Money Mustache

Wed, 07 Mar 2012 12:46:46 +0000

This is my fancy, homemade "construction radio". Booming bass, workplace toughness, extra plugs, 25 foot cord. Made almost entirely of stuff I got for free. Bonus: people tend to get a good laugh out of it.

I grew up in a pretty low-key family, financially speaking. We always had plenty of money for groceries and my parents never went into debt, but if you were one of the Joneses* living down the street from us, you'd be hard-pressed to notice any flashy spending.

This upbringing occurred in a pretty small town (we only got our second stoplight around the time I reached high school), and there wasn't a lot of wealth to be flaunted around there. The closest thing to riches was a *very* attractive girl in my class named Kim who got to drive her parents' brand new 1992 Mercury Cougar from the nicely-outfitted family farm to the high school every day.

This town was located in another country called "Canada", and we were known at the time for being less wealthy and flashy than our neighbours to the South. Hearty lumberjacks with big beards and plaid shirts were part of our iconography, even if my own area was a bit more clean-shaven.

And finally, all of this happened in the 1980s and 1990s, at a time when *all of us* had simpler and less flashy lives. The very first cell phones – the ones that were tethered with a coiled cord to a base unit as big as a car battery – were only things to ogle curiously and were priced at $1999 on the last page of the Radio Shack catalog.

Even in university I was barely aware of wealth. We Engineers are notorious for our lack of cash-flaunting (and status-detecting) skills, so I thought of all of us as equals. There were a few rare kids that had expensive mountain bikes or laptop computers at the time, but for the most part, we all paid our own tuition with money from crappy jobs working at Subway or Costco if you were lucky, and lived in cheap basement apartments.

So for most of my early life, I wasn't even *aware* that money was something that could be flaunted to others. I thought it was a tool for buying your groceries, or if your parents really did well, a back yard swimming pool.

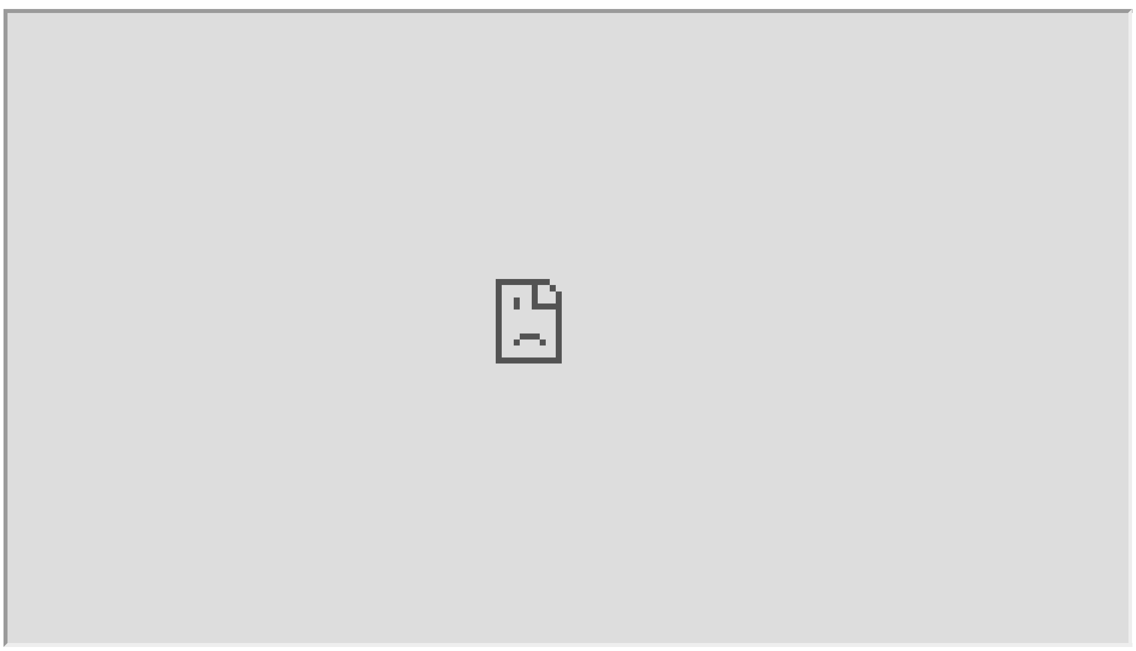
I think I experienced my first flaunting experience just after I had graduated and started working full-time in the software field. Some friends and I went on a summer trip to "Sherkston Beach", a low-budget Canadian version of what they call "Spring Break" here in the US.

Beers in hand, we walked along the shore to join the party. I noticed that a long line of very clean and shiny cars had been parked along the beach, and each was playing some sort of boo-tss-boo-tsss dancy music from an upgraded stereo system. The owners of the cars, invariably tanned and bare chested dudes with expensive sunglasses, frosted hair tips and their little muscles carefully flexed, were busily walking around their cars, tending to this or that, setting up beer coolers or polishing volleyballs or otherwise keeping themselves busy.

"What is going on here?", I wondered at first. "Why are their cars so clean? Why are they so well-groomed on a camping trip?.

"Oh… I think I get it … they are attempting to *show off their wealth for the benefit of all the fine ladies around here*."

The whole scene seemed a bit amusing and evolution-driven, like the complex bird mating dances in Madagascar that David Attenborough likes to teach you about:



At the time, I was finally working an "adult" software engineering job so I was probably making more money than any of the dancing bird boys. I even had a nicer car, since I had not yet learned of the folly of this type of purchase. I remember my car, dusty and parked over next to my tent, getting a bit of positive attention from men and women alike… and I admit it felt pretty nice at the time.

When I got older and moved to the USA, however, everything stepped up a few notches. I saw parking lots just casually filled with cars fancier than anything I had seen in my entire childhood. I learned about neighborhoods where people *engage in passionate gossip about* each other's wealth, and even enforce gardening and house painting standards upon each other to "preserve the property values."

I heard about "Golf Club Memberships", a bizarre concept where you pay thousands of dollars *in advance*, for the privilege of paying hundreds of additional dollars each time you play golf at certain courses.

And I learned that people consider it *prestigious* to spend money on these expensive things, even while they consider it a *hardship* to lead a life that does not include the expensive things.

When newcomers stumble across the Mr. Money Mustache blog, they are immediately excited by the idea of early retirement and a lifetime of freedom. But then they are immediately dismayed when they realize that to earn this freedom, they will need to spend much less money than they earn, for several years.

> **"Dammit!", they say. "I want the reward, but I really don't want that hardship and struggle that it takes to get there. I will be viewed as a *lesser person among my peers if I dare to embrace such frugality!"***

Well guess what? You can now drop your fears of looking like a loser, because things have changed. If you haven't heard the word, here it is:

Frugality is the New Fanciness.

Let me explain, for those still not convinced.

In the olden days, times were much tougher. Most of us struggled to keep food on the table and to keep the water from leaking through our roofs. The economic system was simple, based on slips of paper in bank vaults and file folders, and gold coins. The credit system was in its infancy so the average Joe couldn't just go out and borrow money to buy whatever he wanted.

In these conditions, it took real skill to get ahead. A man had to really master the system to pull himself up out of material scarcity. This meant studying financial concepts, understanding the emotions of fellow humans in order to rise into a position of leadership, and even conquering his own fear and lethargy to avoid the temptation to sit at home and do nothing all day.

Only after mastering these tasks, could someone start a successful business or earn a promotion to the top of an existing one, and only at that point would he have enough cash to buy a flashy house, or expensive artwork, or jewelry, or whatever else the status symbols of the day were.

So when the successful olden-days businessman walked down the street with these trappings of success, *it could* ***reasonably be deduced that he was actually somewhat badass***.

Of course, if he later passed on his wealth to children who would then flaunt the wealth without having earned it, the next generation could grow up with the option of fake flaunting. But for a moment, let's suppose that at least sometimes, the wealth being flaunted in the streets in early 20th century America was self-made.

Because of this, showing your wealth was a sign of status, as it was proof that you had taken a more difficult path and succeeded.

Now let's fast forward to the present day. Everything is fucking amazing – we all have touchscreen computers in our pockets that can listen to our voices and speak back, while accessing the sum total of humanity's knowledge instantaneously through invisible radio waves. We have cars that can shoot us across the country in climate-controlled comfort, yet they're cheap enough for teenagers to buy them on minimum wage.

And most significantly, credit is so widely available that anyone with a heartbeat can sign up for tens of thousands of dollars in debt. You can buy anything you want, even if you have no money at all. People buy houses with an 80% mortgage, and then get a second mortgage for the other 20%, and cars are bought with zero dollars down as well. And almost every single person does this.

In this environment, the *easy path* is to do what everyone else is doing. You see an ad for the iPad, or the Ford Expedition Extradouche Signature Edition, and you are excited by the power and the sleekness. You've got no money, but thanks to the advertising and peer pressure you've got plenty of desire. So you swipe a card or sign some paperwork, and now you too have the fancy stuff.

These days, it's *totally normal* for even the most indebted people to go out to enjoy acres of Sushi and lakes of Sake on Friday nights, laughing and having a grand old time without the smallest thought about the deepening grave of debt they are digging. It doesn't even strike them as a problem that they don't own their own houses and even their cars are borrowed.

> ***"This is socialization, it's important!"*, they rationalize. *"And besides, sushi is extremely yummy!"***

You too want to participate. You drive yourself to the restaurant in your own borrowed car and live "the good life".

It can be pleasant to indulge in these things, and it sure is easy. But there's another path available: **the more difficult yet far better one.**

Certain rare people live in the same society, and work the same jobs as the folks described above. But they're a little bit better at math, and they can think a little bit further into the future. They see that money is useful for spending, but even more useful as a tool for earning more money.

So they train themselves to master finance, and hard work, and self discipline. And they figure out how to have *just as much fun as the big spenders*, while being sure to do it in a way that allows them to save at least 50-75% of their income. It has already been proven that these people can meet or exceed the happiness levels of the more spendy group. The only difference is that they are able to spend less.

To top it all off, research comes in that the spenders are in fact consuming too much of the world's resources. Oil reserves, Ice caps, and Ecosystems are taking a huge hit. The spenders refuse to believe this, latching on to any information that justifies the continuance of their lifestyles. The companies that provide their consumables are only too happy to furnish this information. Only those with the ability to understand scientific research are able to see through the haze.

In this situation, which group is more badass, more skilled, and thus more worthy of social status? The spenders, or the savers?

See? **Frugality is, quite obviously, the new Fanciness.**

The only reason to maintain a non-frugal lifestyle in the face of all this evidence, is if you're too stubborn and stupid to accept it. Will you continue to fight against frugality, to show the world how stubborn and stupid you are? Or will you wise the hell right up right now and start showing your better side?

The only thing that has been missing for the rich world's Fancy Frugal people, has been a support community. When you're living a life that is so different from your neighbors, it can be hard to remain confident that you're doing the right thing, no matter how right it seems in your own heart.

But now the times are 'a' changin'. The Mustachian Nation has been born. Look around at the comments on these articles and in the Forum. These are real people, *tens of thousands of them*, who have collected here on a less-than-one-year-old website that does no advertising or promotion. These people were already out there, and they are growing in number every day as more people see the light.

A great thing about frugality is that it still allows you to show off in a hilarious and social way. In the olden days, the executives at the golf resort felt camaraderie as they showed off their Rolexes and BMWs and thousand-dollar titanium drivers. It wasn't the actual nature of these products that made the situation fun, it was the fact that they felt *close to each other* as they joked about their latest purchases.

When Mustachians gather, they show off the way they have modified their 30-year-old work trucks to work harder than brand new ones while burning less fuel. They bring their home-made radios to the campsite and share tales and tips of how it was made using entirely leftover materials. They discuss strategies on how to feed a family with peak nutrition and deliciousness, for less than $1 per person per meal.

And unlike those who compete to consume more, these people actually have something to be proud of – they are blazing the necessary path towards a sustainable life for everyone. Eventually, all humans will have to learn to live on what the planet can regenerate each year. When you use more than that, you're stealing resources from your own kids, and from the rest of the people you share the globe with. You don't have to feel guilty about this.. you just have to feel good when you stop doing it.

This appreciation for our badassity is still rare, but it's growing. If you adopt a frugal lifestyle, you may occasionally have to endure some misguided shit from clueless consumers around you. I took lots of it from the MSN readers back in January, although nobody has hassled me in real life so far. But you will also find you start getting some envying looks and respect from other people for your frugality skills. Eventually, just like the BMW-financing 21-year-old gets respect at Spring Break today, you will in due time become a hero in your own community for doing what's right.

But ironically, the same skills that will get you there, mean that you won't give a shit what they are thinking.

Onwards, my Fancy Frugal Friends!

**we really did live two doors down from the Jones family. But they didn't buy much of anything either.*

Housing Prices: Bargain of a Lifetime, or Much Further to Fall?

By Mr. Money Mustache

Fri, 09 Mar 2012 13:00:04 +0000

Back in November, I read an article in the Economist with the tagline “House of Horrors: the bursting of the global housing bubble is only halfway through”.

I usually pay close attention when the Economist calls a bubble, because unlike the daily rollercoaster of stock cheerleading and fear you read in most US newspapers, the writers over there have a sound understanding of, well, economics. Armed with just [that relatively simple knowledge](), you can usually call “bullshit” on many of the financial world’s most pronounced hissy fits, and rake in steady investment returns while your day-trading neighbors get crushed by a bear market.

In the article I read, the Economist pointed out that the housing market responded very differently around the world to the great financial crisis of 2008.

Here in the US, prices fell about 34% from peak to trough when measured on a nationwide basis. But this figure masks some even more brutal falls: in the most prosperous and supply-constrained areas like Manhattan and San Francisco, prices barely suffered a dent. In wilder and more speculatively-overbuilt areas like Phoenix, Las Vegas, and Miami, some neighborhoods went on sale to the tune of 75% off, with foreclosures making up over half of all property sales for several consecutive years.

In the UK, prices only dipped 10% before resuming their climb. (See this nice article on Monevator for more analysis on the UK/London side of it). And in Canada, just a canoe ride away from the brutally crushed market of Detroit, price rises have continued unabated and continue to set new records. Toronto residents usually fall unconscious when I tell them that they can currently buy a luxury 4-bedroom home with palm trees and mountain views, for less than the value of their one-car parking space.

So when you ask "are houses overvalued?", you need to qualify the question by specifying a city and country. The situation varies greatly by location. But how can you judge the true value of a home? A pad in New York City is surely worth more than an equally-sized unit in St. Louis, because the supply and demand situation is drastically different. But *how much* more is it worth?

Housing economists are the ones best qualified to make this call, and the way they do it is by measuring at least these two factors:

- The price-to-rent ratio
- The price-to-income ratio

When you look at those things, and compare them to the historical average ratios for your area, you can get a good idea of whether you're in a bubble, or a bust.

In the US, the price-to-income ratio took a huge 75% jump through the mid 2000s, but the subsequent crash brought it down lower than ever before. It now sits at least 20% below its historical average.

In Canada, on the other hand, the price-to-income ratio is at an all-time high, at least 29% above the average. In the UK, this overvalue ratio is at 20%.

Price-to-rent ratio is simply a measure of how much a house costs, versus the gross income it would collect if you rented it out. A common rule-of-thumb here is 20. If a house costs more than 20 times the annual rent, it's possible the prices are overheated in that area. In the foreclosure project, we picked up a house that cost about 10 times its annual rent after renovations – a good buy. In San Francisco, houses cost about 30 times their annual rent – a bad buy. Over time, these things tend to revert to their historical mean – prices will fall and/or rents will rise.

Price-to-income and Price-to-rent are cool ratios, but it's not always easy to find a big spreadsheet of the data for every city. If you just want the quick-and-dirty guideline, you can look at a chart of inflation-adjusted house prices. Why? Because both rents and incomes tend to rise roughly at the rate of inflation over time*, and so do house prices. If you see the house prices take off at a slope that is much faster than inflation, watch out for bubbles.

Being a big fan of economist Robert Shiller's book "Irrational Exuberance", I visited his website and downloaded the housing price spreadsheet, using it to generate this graph of inflation-adjusted US house prices from 1890 to late 2011:

Things got a little silly in the 2000s, but are starting to look quite reasonable now.

Dr. Shiller has been watching both stock prices and house prices for many years, so throughout the 2000s, he was calling "Bubble! Giant Stupid Bubble! Hello!? Is anyone listening? Stop buying houses and stocks! Look at my graphs!".

Most of us didn't listen to him, but the information has always been out there for those with the knowledge to keep an eye on it. An asset bubble forms when enough people collectively say, "This time it's different, and the [houses/stocks/gold bars/tulip bulbs] will forever be worth more than ever before. The bubble looks like a part of the graph that doesn't belong, suspiciously similar to what we see today with gold prices.

Nobody can predict the future with anything close 100% certainty. But using a good understanding of economics to make some educated guesses, you can occasionally spot an inefficiency in the herd mentality of the world, and avoid losing a bunch of your money in the stampede.

In today's case, the 'herd' is the stream of fearful young couples I hear from regularly, who say things like "I'd never want to buy a house – look how much the prices have dropped! And have you heard about what the Federal Reserve Toilet Paper is doing to the national debt and also how the European Debt Crisis caused that Carnival Cruise ship to sink and gold bars are the only safe ingredient for salad dressing these days?".

Back in 2006, the herd told me to "buy a 2-bedroom condo in Miami for $600,000 because it's one of the most desirable places on Earth and the prices have gone up at 30% per year, meaning it would be worth $1.2 million before the warranty on the new fridge even expired". (I'm only paraphrasing loosely from a few real estate brochures I read during a trip I took there at the time, but you get the idea).

So in the case of US housing, I feel confident in placing bets on its gradually improving strength. The current inventory of unsold homes has dropped to about 6 months of supply at the current sales pace (down from a peak of over 12 months in January 2009), the lowest level since the spring of 2006. As the supply continues to drop and the foreclosures gradually get gobbled up, the prices will rise again.

In my own city, I see solid returns on rental properties, and a cost of owning that is lower than the cost of renting. Equally significant, many homes are available at a price that is lower than the cost of building them, assuming a land cost of zero. By definition, no new houses will be built under this price condition, meaning that as long as my city's population continues to increase, house prices will have to rise as the supply of available houses falls.

In Toronto, however, I'd place a different bet. House prices there have risen much more quickly than income, leaving the most recent home buyers holding record levels of debt. People are competing with each other to buy houses at more than the asking price, on the fear that prices will be even higher tomorrow. Although the Canadian financial system is more stable than that of the US in 2008, any change in buyer enthusiasm, employment, or interest rates could cause a self-feeding loop of price drops which lead to more price drops, until the price ratios above revert to their historical norms. I could be wrong, but given an uncertain future, I'll make my bets based on my best estimation of the odds.

Your own course of action should depend on a level-headed assessment of your own country and city's housing market. Look at the historical prices and the price-to-rent ratios in both your own city, and other places you might like to live. Renting a house or apartment for now will seem like a less bleak choice if it saves you a load of money during your working years, and allows you to buy a less expensive house further down the road in a more liveable city. In the US, however, the time to buy might be within the next very few years.

** actually, I think economists would say that rents rise with inflation, while incomes rise with GDP growth, which is traditionally a few percent higher than inflation. But in theory, this would result in us spending less and less of our money on housing over time. Therefore, it's possible that rents and housing prices could be expected to rise slightly faster than inflation, while other products like food and durable goods rise more slowly, as we have seen over the past 100 years. But either way, I think my graph is still useful. Any economists want to weigh in?*

Get More From your Day, By Counting the Seconds

By Mr. Money Mustache

Mon, 12 Mar 2012 11:51:18 +0000

I've only got 59 minutes left to finish this article for you.

But I'm glad to have this time limitation, because it will keep me from going into my usual random sidetracks and wasteful web surfing that can easily end up burning half a day and leaving me with a stiff neck and a guilty sense of laziness.

Like everyone except the most glossy and accomplished self-help guru, I still struggle occasionally with trying to get the most out of my day. I have some days where I absolutely kick ass and get many useful things done, but still too many days where I bumble around and make excuses for why I'm not doing what I should be doing .

> Yeah, yeah.. I know I'm supposed to call to make that change to the house insurance policy, but I'm not in the mood to deal with telephone people right now. I think I'll just check my email instead, or clean the kitchen, or.. oh.. what's this flyer that just came in the mail? I think I'll dream about bike parts instead…

This tendency is even more powerful for those of us who are in an office, supposed to be getting work done on a computer. There's an important but boring or daunting task open in the foreground, but there are also several other tabs open in your web browser – I can see that one of them is Mr. Money Mustache, another one is the news website, another is Gmail, and then there is that YouTube video a friend forwarded to you that you'll sneak in when nobody is peeking into your cube. And Oh! An email from your friend just came in, let's read that one first, and by the time you reply it will be just about lunch time – Perfect!

Is it any wonder that we have productive and non-productive days, and that about 80% of the actual money earning results in brain-intensive industries are attained by the top 20% of the workers?

Getting a whole bunch of great work done in a short time is a worthwhile goal for any worker. Because as much as some like to deny it, good work gets noticed and on average over your lifetime, you will be paid for how much work you get done. But it's an even more worthwhile goal for your after-work time and your weekends, because your employer is not taking a big cut of the profits. In the Forums of this blog and in emails, I get to read some very happy stories about people who saved $400 on mortgage or insurance costs, with just an hour of work.

Even in my own life without a real job, I get great benefits from getting things done. The biggest one is happiness – I am simply happier at the end of a big day of accomplishment, than after a day of unguided computer fiddling. But how can I pack more into my days while limiting the time waste?

The solution I've been trying out recently with great success is simply **putting myself on the clock**, at least once a day. If I start a countdown timer on my phone, and put it right next to my computer with the seconds ticking away, I am instantly made aware of the passage of time. I suddenly have a goal to write this whole article, including adding the pictures and re-reading it a few times and editing it at the end, all within the span of an hour. That's a short time to write something (there are only 32 minutes left), so I'm sure as hell not going to take a break, open up a few more tabs in the browser, see what's going on in the comments section or the statistics section, or other such nonsense like I usually do.

When you get a task done in an efficient manner like that, you get the full reward of the accomplishment, with none of the extra non-rewarding guilt and time suck that comes along with procrastination.

Even more significantly over the long run, you have planted the seed of a new habit – being an efficient person. Over time, you can force this new habit to overtake the old bad habit of inefficiency. That is a pretty powerful thing when it comes to making money for yourself, since getting things done directly correlates with income.

I've also started using the timer for my weight training and crossfit-style workouts. In the olden days, I'd go down to my basement gym with just a vague goal, like "today I want to exercise the chest and back muscles". Now I write down something specific, like "One set of bench presses, one of pull-ups, one of box jumps – **and then repeat the cycle as many times as you can within 18 minutes!**

That simple change of going from "get something done", to "get as much done as you can within a fixed time limit with a counter" makes all the difference for me. I find I do more sets in an 18 minute time period than I would normally do in a 40 minute traditional workout, all with a much greater intensity due to an elevated heart rate. It's a competition against myself, which is my favorite type of contest.

So next time you have something that you need to get done, just try the experiment on yourself. Write down the goal on a piece of old-fashioned paper. Then put a countdown timer on top of the paper so both things are staring you in the face.

Then get to work.

And it looks looks like I'm done my own work day, with 3:02 to spare.

Happy Monday!

Why I am SO Not Buying an iPad 3

By Mr. Money Mustache

Wed, 14 Mar 2012 11:48:08 +0000

This is Mr. Money Mustache's computer. Look carefully, because this is how advanced the iPad 3 will look to you in just a few years.

Mustachians are a tech-savvy bunch. From what I've heard, engineers and other professionals are way over-represented in the audience compared to the general population. We may think we're pretty smart, but we are actually some of the biggest suckers out there when it comes to the unfortunate condition known as **gadget addiction.**

I'm right there with you. I am a recovering gadget addict, which is similar to a recovering alcoholic in the sense that you never really cure the addiction, you just learn not to indulge it. I have gone over a year since my last electronics purchase of any type, but if you put a Newegg catalog in front of me, my heart will speed up, a column of drool will start to hang from the corner of my mouth, and I will read and memorize every word of every product description in there, and fantasize about buying it. Thankfully, I will then proceed to buy nothing.

I wasn't always so successful in non-buying of electronics. As a six-year-old I used to string miles of colorful wires between a grid of bent-over nails stuck into a board and pretend they were an advanced computer. In 1984 I saved up $25 of cold hard cash and blew it all at the local Men's Accessories store on a big nerdy "calculator watch". Later I bought an AM radio watch at that same store and briefly entered Heaven when listening to a scratchy rendition of Toto's Africa on it late one night.

By age fifteen I had over a thousand dollars of stereo equipment piled up in my bedroom, and a couple of computers as well. I bought one of the world's first, and crappiest, digital cameras in 1997, and I've owned six more since then. Even after cutting my inventory, I still own at least eight pairs of speakers and four amplifiers. Parents and former roommates have commented to me that the most lasting memory of having me around is the cardboard boxes filled with wires and connectors that I seem to generate and then leave behind when I move. And we haven't even talked about computer upgrades yet.

So yeah, Lady Gadget and I have had our time together. But in the last few years, I have really gotten control of the situation. And it feels great. Even better than continuing to indulge the addiction.

This week, one of the most significant gadgets in history is being released for sale. The Apple iPad 3. It's a tablet computer that incorporates every electronic feature and technology that has ever been invented by the human race, all in a glossy and paper-thin case that is beautiful and sexy enough to wear as a bikini bottom.

I'm not going to pretend to you that I don't have an irrational desire to own one. I have had detailed fantasies which involve me kicking back on the couch and luxuriously fingering my way through fascinating novels with the feather-light device effortlessly palmed in my hand. Later I'd be hunched over the iPad at a bar table, surrounded by beers and friends, as we put the finishing touches on the world's best hip-hop track. At other times, it would be cradled in a home-made wooden stand on my kitchen table as I use a wireless bluetooth keyboard to write MMM blog postings like this one. Later that night, the Mrs. and I might fire up Netflix on it to watch a documentary in bed.

Would I enjoy it? Sure. Is it convenient? It seems so. Can I afford it? Definitely. Am I going to buy one? HELL NO!!!

Why? Because the iPad 3 is just another one of Lady Gadget's classic siren songs. It is the most advanced example yet of Hedonic Adaptation at work. While it may sound confusing to the more Junior Mustachians among us, I am not spending my days searching for immediate enjoyment, thrills or convenience. Instead, I am gunning for the much more elusive goal of **lifelong happiness.**

So when deciding whether I want an iPad 3, I don't ask myself if it would be fun or convenient. That's the wrong question. I ask myself, "will this thing really increase the level of my lifelong happiness?".

This is a very interesting question for me, because I am already super, duper, ridiculously goddamned happy these days. I've worked and studied hard to attain this happiness, so I have learned that for me it comes from freedom, my family and friends, hard work which features both mental and physical challenges, a chance to help others, and constant learning. I've also learned that my less happy days are the ones where I become addicted to playing with gadgets and computers, and I end up missing out on the things that make me really happy.

From what I can see, the iPad offers a compelling distraction, but it's not going to get me out on any more camping trips, and it also won't help me meet any more great people than I would otherwise meet. It would make my computer life better, and my real life worse.

I've also developed another trick to help ease the desire for new electronic toys: **I take out some of my obsolete electronic toys and look carefully at them**. Just a few years ago, these things were brand new and amazing. I wanted them just as much as I want the iPad. But now they are clunky and junky. Many of them broke after a very short service life, or didn't work as well as I had hoped.

My 2007 Asus EEE pc netbook lost the ability to type the letter "l" and the headphone jack cracked. My 2010 Nikon P100 digital camera has always taken awful outdoor pictures. My Black and Decker home energy consumption display was never accurate and it constantly drops its connection to the outdoor unit. After a lifetime of getting annoyed at obsolete and broken electronic things, I finally learned that the problem is not with the gadgets, it's with the guy buying them. So I stopped buying them.

For most of us, there's yet another reason to avoid buying the new iPad: **we already have stuff that does everything it does.** I have a desktop computer. I have a laptop computer too*. I even have a pocket computer (an Apple iPhone 4) that fills in the remaining small gap in functionality that the other two left unfilled.

Even with this antiquated set of devices, *I am a goddamed computing machine*. I can read, write, communicate, and take and edit pictures, movies, and sound from almost anywhere on Earth. If pressed, I could jack into a sound system as I whip out a virtual turntable on the telephone, and mix an impromptu rave for the entire population of Europe, who would dance below my podium on the main balcony of the Vatican. With only a few minutes' notice. *How much more gadgetry could I possibly need?*

And if I have this many options open to me with my 7-year-old computers and dusty previous-generation telephone, who the hell are these people who bought the iPad 1, the iPad 2, each of the iPhone versions, a couple of Kindles, and are now Jonesing to get their hands on the Three when it comes out on the 16th? (I actually know a person like this).

They are people who are deeply in need of a Punch in the Face from Mr. Money Mustache, if you ask me.

Sure, there are still a few groups of people for whom an iPad 3 purchase might be reasonable. If you don't own any other Apple stuff, and have only a big beige desktop computer with a squeaky fan: investing in a tablet might actually help you get more work done. If you're a wedding photographer and you need the full 2048×1536 resolution of the new iPad to tantalize high-end clients during your pitches to get celebrity wedding gigs, it might be reasonable as well.

But for the rest of us, I think a much better goal is to live with the *smallest number of gadgets* possible.

If you haven't even reached Financial Independence yet, the decision is really easy: you can't yet afford frivolous gadgets – get back to work, and save that money instead. It's Maximum Mustache March, for goodness sake!

But even if you are infinitely wealthy, dig deep into your soul, and make a list of what you want to do more of between now and the day you die. If one of those activities really is surfing the web even more than you do now, then go ahead and buy the iPad.

But if not, let go of your desire and let's go out for a bike ride instead. I can see it's a beautiful 72-degree day and I am closing up this very old computer right now.

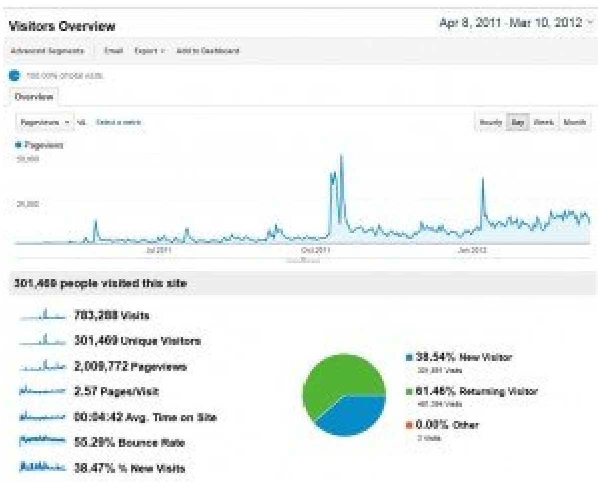
** Thanks to a generous MMM reader, I now have a functioning laptop computer again! My old one died last month, and I made a point of not buying a new one, figuring there were surely plenty of old, free ones that would do the job. The one she sent me is missing the letter "B**" (I have to press the rubber nub where the key used to be to get that letter), and it came with a few scratches, cracks, and even bread crumbs. Because of these flaws, it is an absolutely perfect way to get my work done with less risk of gadget addiction. Thanks again friend!*

** I will probably be gluing on a new letter "B" eventually, although I do like the idea of the word "Badassity" requiring some actual badassity from my index finger every time I type it.

Get Rich With: Blogging?

By Mr. Money Mustache

Fri, 16 Mar 2012 12:03:24 +0000



Well, there goes another million.

Sometime last week, this blog reached the "two million page views" milestone. It took less than three months to get that second million, compared to nine months for the first one, which I wrote about on December 10th. I remember we all thought we were pretty big business back then, but by any measure there are now more than **twice as many** Money Mustaches growing out there as there were when we blew past the first million mark!

Blogs that talk too much about blogging can get pretty boring, so don't worry, I'm not going to write an article like this for every million. But today I thought it would be worthwhile because there are several interesting lessons that I've learned from this writing hobby that I've wanted to tell you about. Hopefully they will be useful for the many other blog writers that hang around here, as well as for writers of other stripes and even regular Mustachians.

Lessons Learned:

1 – It's really hard to understand exponential growth.

Even though I occasionally like to write equations and draw graphs in my spare time, I still find that I have the natural human weakness of thinking in linear rather than exponential terms. When I check this website's statistics page each night, it looks like readers are just trickling in at a steady rate, like guests to a nice party. But when you look at a graph that spans several months and divide out the numbers, you can clearly see that an exponent is at work. The exponent always surprises you.

This has applications in any internet-related business or creative venture, since the pool of people on the internet is effectively infinite. If you can get something started that has a positive growth rate, that tends to grow all by itself (by word of mouth, or search engines, or viral-style-forwarding), you can end up with some very interesting results. The Honey Badger video that we all like to quote from is up to 40 million views. A friend's internet-based sales business is making tens of thousands of dollars per month in sales, just because of a bit of self-perpetuating exponential growth.

It also has applications in saving for early retirement. Beginner Mustachians are occasionally blown away by the numbers we throw around here. "Nobody could save *hundreds of thousands* of dollars!", they say, "I've only got a few *hundred* bucks and it was damned hard to save that much!".

I felt much the same way when I was younger. The problem is not with the numbers, it's just with that tricky exponential function again. Today's hundred-dollar-saver can invest his savings even as he improves his skills at efficient living and increases his employment income over his working career. When you combine all of these effects, you will see strong exponential growth in your savings. The hundreds of today can quite easily become many thousands per month in the future, until in the years just before retirement, many people are easily increasing their wealth by over $100,000 per year – sometimes more than their entire gross pay.

2 – People can actually make money with this blogging thing.

When I started writing these articles, I assumed I would only be entertaining myself and a few facebook friends until I ran out of stuff to say. The writing habit proved quite addictive, however, and the number of fun and enthusiastic readers grew. So I upgraded my goal slightly to "Saving the Entire Human Race from Destroying Itself". But even at that point, I never thought I'd earn much more than the cost of paying the web hosting fees.

But one day, I had a look around at some other personal finance blogs. It turns out that these things are serious business. Sites that rank in the top 20 on the Wisebread list are routinely bought by internet marketing companies, often for over a million bucks. One clever guy named Pat Flynn who runs smartpassiveincome.com is an expert at generating income from websites. Last year he raked in over $400,000 from his carefully designed portfolio of sites. Get Rich Slowly, possibly the biggest blog in this niche, sold over three years ago although the sale was a secret until recently.

The most surprising part is that MMM already has a larger amount of traffic than some of the big-name websites at their time of sale. I don't know exactly why this has happened, since we have done almost no promotion of the site. But I like to chalk it up to the fact that Frugality is the New Fanciness. This is an idea whose time has come.

In the right hands and with enough flashing credit card ads, a site this big could probably already earn more than my software job used to pay. You can tell from my feeble attempts at revenue-generation that income is not one of the main goals of this blog. But I will still proudly note that we earned $500 last month, and the income graph also has one of those sneaky exponents at work!

And don't worry, I am not even thinking about selling this thing. Someone did send me an unsolicited offer once for something like $10,000, and I thanked him for the information. But it seems unlikely that anyone would want to pay in the millions for a blog, with the condition that the author can continue to write (or not write) whatever he wants and quit at any time without notice.. with anti-consumerism, political incorrectness, and swearing being key parts of the message.

But I do love learning about this entirely new field, and I am pleased to see that writers now have a more democratic way of making a living than they did back in the old paper publisher days. Even big-time authors like Joe Konrath now publish exclusively in e-book formats, and they find they earn more money doing that then they could with big traditional book deals.

3 – It's Time for Mr. Money Mustache to Get Off His Ass and Write.

The biggest thing I have learned from this Two Million Views business is that we are onto something big here. If this blog really is one of the fastest-growing things in the entire personal finance blogosphere, then maybe I'd better start taking it a bit more seriously.

So I'm going to set a couple of goals. I'd like to increase the amount of time I spend working on this site. Not to the point of burnout, but I'd at least like to get a chance to write up more of the 100+ draft article ideas that keep piling up, and answer more of the emails that people send me. I'm going to talk to more people, take better pictures, start putting out the odd amusing educational video, do more science experiments.. stuff like that. I've even applied to be a speaker** at this year's "FinCon" (financial bloggers conference) since it's right down the road in Denver, and hey, I like talking.

I'd also like to set a goal of **having this writing gig pay for my whole family's living expenses**. That's about $2000 per month. Yeah yeah, we're already retired and all that, but I think it would be nice psychological boost to be able to say that I'm supporting a family just with writing, and more importantly to share my thoughts on how easy or difficult it is to do without any soul-selling.

In reality, since we already have our consumption covered from other income and we have no desire to spend even more money, that means that 100% of MMM proceeds will in some way, over time, be used to improve the world. I'm not sure exactly how yet, but I still like the idea. Plus, as blog writing increases, my carpentry income has to decrease, which eats into my safety margin. By making a point of having the blog earn just a little bit of income, I can regain this margin.

We Mustachians are still a brand-new family. Most of the world has barely even heard of us so far. Truly big websites get millions of page views per week, or even per day.

That's fine with me, since I'm here just to write to you and I have my own way of defining success. But if you do want to help out, here are a few ways to game the system a little bit:

Follow MMM on Twitter by clicking here.

Befriend MMM on Facebook by clicking here.

Become a RSS subscriber by clicking here. Even if you usually read on the website (which is the way I prefer to read blogs), this helps boost the still-important Feed Subscribers number, and you might learn a thing or two about the convenience of RSS reading as well.

Hardcore readers can install the Alexa Toolbar* which will boost this site's Alexa Rank.

Some generous people have actually *asked me if they could donate to this blog just to say thanks*. I have always said no in the past, but given the new goals above, I will now accept that generosity and see how it goes. This is of course fully optional.. if you just want to read for free, please continue to do so!

This Paypal Button

PayPal - The safer, easier way to pay online.

In the long run, the biggest fundraiser for this blog will probably be the MMM Recommends Page and the Commission-paying Rewards Credit Cards list. I like that method, because those things are tucked out of the way, useful, and non-spammy.

That's enough of this behind-the-scenes stuff, it's time to get back to the real world. Thanks again for reading and I'm looking forward to taking it all up several notches as the blog begins its second year of existence in just a few weeks.

Yee Haw!!

**The Alexa Toolbar is a browser add-on which displays the ranking of any site you visit in a tiny bar graph at the top of the browser. The toolbar sends anonymous stats to the Alexa web ranking company, which in turn determine the popularity of that website. The only weird part is, only bloggers actually use that toolbar, so your Alexa rank is really a measure of how popular your site is with bloggers. But yet many people haven't caught onto this weakness, so your Alexa rank influences your rankings in the various top 100 blogs lists as well as how much you get paid for advertising spots. If a significant number of readers could be enticed to run the toolbar… hoohoo, that would be funny. There are already blogger networks which do a good job of exploiting this loophole, although MMM is not a member of any, hence my less-good current rank.*

Boxed Wine: Not Just for Your Alcoholic Aunt Anymore

By Mr. Money Mustache

Sat, 17 Mar 2012 11:57:55 +0000

fancy Adirondack chair for her own patio. After we finished our work, she insisted on paying me with a huge pan of some delicious homemade dinner, and a box of wine.

The food was a major score, since this girl can cook like a demon. But the box of wine turned out to be even more profitable, because she had opened my eyes to a whole new world of wine buying that has saved me hundreds of dollars since then. And now I am pleased to pass those profits on to you.

The wine she brought to me was called a "Bota Box". As you can see from the picture, it comes in a stylish and hipster-friendly box made of unbleached recycled cardboard. The most interesting part of the box is that picture of FOUR wine bottles down in the corner. That's right – one of these boxes, which is shorter and easier to carry than a single wine bottle, contains an equal amount of the good stuff to four 750mL bottles.

The benefits are many, and there are no drawbacks. This Bota Box wine, as well as several of its competitors like my current favorite "Banrock Station", is some really good stuff. The quality is comparable to what you'd find in $10-$15-per-bottle wine in my own area, which translates to what Antimustachians would pay about $35-45 per bottle for in a restaurant.

I'm not a wine snob, as that is a highly unprofitable affliction to develop. But I can still appreciate the difference between the very cheapest bottles and the midrange stuff most of us buy. (As you might expect, I have also experimented in the ultra-cheap zone, but unfortunately the sheer badness at that end of the spectrum forced to move back up a little).

But the Bota Box costs about $20 per box, which translates to $5/bottle. Banrock has been on sale in my area recently, so I picked up a couple boxes at $13 each (regular price $18, which means I am getting great wine at $3.25/bottle*.

This is a significant find for party people. I know of many young couples who consume a bottle a week between them at $10 a shot. Using my usual rule of compounding (multiply a weekly expense by 752), this burns up $7520 every ten years. Switching to the boxes at my current sale price saves them $5076 of that amount. In other words, you could cut your wine bill by almost 70%, even without having to cut down your drinking!

Having the wine in a box also adds novelty to a party. You set it up on a shelf, and when you're ready for a refill you push the red button and watch wine rapidly flow into your glass. There are no downer moments when you realize the bottle is empty after just one round, and there is no forced extra drinking to "Kill the Bottle". It's like having great red wine permanently on tap.

The other benefits are practical as well: These boxes stack efficiently and don't have the extra weight of glass, so they are ideal for road and camping trips. You can whip one out even in a public park where glass is prohibited. The container lasts forever when left closed, and still over a month at room temperature after opening, because the wine is stored in a vacuum-packed foil bag so it is never exposed to oxygen.

And finally you save a good percentage of the natural resources normally used to melt, form, ship, and recycle four glass bottles. At the end of your drinking, you're left with an ounce or two of recyclable cardboard and a very tiny quantity of collapsible plastic.

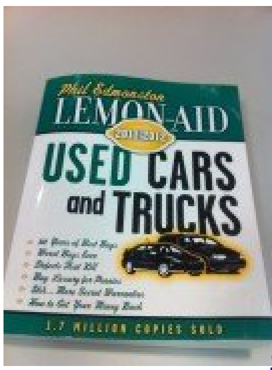
It has been over a year since my friend showed me this new trick, and I haven't felt the need to buy a single glass bottle of wine since then. I hope it enhances your weekends as much as it has mine!

** Only people with access to Trader Joe's can beat this level of value, and alas, TJ's does not yet exist in Colorado. Also, we haven't fixed our liquor laws to allow alcohol sales in standard food stores yet. Biggest drawback of the state, in my opinion. But at least there are still nice privately-owned liquor and wine stores everywhere.*

Top 10 Cars for Smart People

By Mr. Money Mustache

Mon, 19 Mar 2012 12:00:03 +0000



discussions on the matter in the Money Mustache Forum.

I find myself typing out the same list of recommendations over and over again, so I thought the best strategy would be to dig in, do some up-to-date research, and lay down the law on exactly which cars are most worth owning.

There are two things that matter above all else in car selection these days: Fuel economy, and passenger/cargo space. Depending on your personal taste, you can then sort the winners based on things like acceleration, ground clearance, color, smell, style, NHTSA safety test results, or other things. But the important thing to note is that all of these traits are available even in fuel-efficient cars, so all gas hogs can immediately be ruled out. Note that I didn't mention "price", because thankfully, the fuel-efficient cars are usually the less expensive ones anyway, so you automatically win by prioritizing efficiency.

"But what about reliability?" you are asking. "My uncle had a Ford F-150 that lasted him 46 years, but my cousin had a Honda Civic that was always breaking down. So I only buy Ford Trucks now".

The key to finding a reliable car is to throw away all the anecdotal personal stories that you might have heard, and look to a source that actually collects this data from thousands of people. The two best places to get this information are Consumer Reports magazine, and Phil Edmonston's Lemon-Aid Used Car guide. Both of these are useful publications, and for this article I have consulted both and done my best to combine the results.

At my local library, I found a copy of the latest edition of Phil's book. I was pleased to note that he has become even more crotchety and demanding of cars in the decade since I last read his stuff, which is exactly what you want in a car reviewer.

Lemon-aid guide collects reliability data from its millions of readers and also from government agencies. Since Phil Edmonston lives in Canada, much of his research is done there. That country is an ideal testing ground for cars, since the demanding driving conditions really bring out any reliability problems. The book then sorts the cars into five categories: Recommended, Above Average, Average, Below Average and Not Recommended.

The vehicles are further broken into classes like "Small, Midsize, Large, SUV, Sports Cars, Pickups". Since these are North American classifications, where even a "Small" car is big enough to fit five of me comfortably (just over 6'0″ and 180 lbs), the Small category is the only one a sane person could rationally consider except in the case of very large families, physical disabilities, or business use such as construction or delivery. (If you need more cargo space occasionally, just add it temporarily).

To add a second perspective, I bought you a subscription to the Consumer Reports website (consumerreports.org), and read all of the used car guide articles there. Consumer reports is a great organization, but they are still a bit too "Consumer" oriented for my tastes. Most notably, they only have reliability data on the most recent 10 model years of cars, while for many Mustachians, the *newest* car they would consider is more than 10 years old. I mean come on, it's 2012 now, meaning a 10-year-old car is a 2003 model year. I consider that to be "almost brand new".

They also fail to point out the fact that all but the smallest cars (and virtually all trucks) are stupid choices for the average person. A car is not a luxurious salon for you to lounge in while you flaunt yourself to the world. It's a handy machine that helps you get to very distant places on those rare occasions that you are too much of a wussypants to bike there. Over time, these occasions will become more and more rare, meaning you will be using a car less and less as you get your life in order. If you choose wisely, your next car might be the last gas-powered vehicle you need in your life!

But boiling it all down, the following list contains the fairly recent used cars that best combine reliability, fuel efficiency, cost, and hauling and handling performance.

There are some real shockers on this list – for example, I never would have guessed that the Hyundai Elantra would score above the Honda Civic in statistical reliability, and many people don't realize that Volkswagens are some of the most trouble-prone cars around in the pre-2006 model years likely to be considered by readers here. Read through the list and then I'll try to calm you down and dry your tears afterwards.

Recommended

Honda Fit (2009+)

This is a jack-of-all-trades car that combines fancy style, high cargo and passenger space, and a 35MPG highway rating. The latest model is pretty new, however, so it's one of the most expensive options here (about $12,000 for a 2009 with 36k miles).

Hyundai Elantra Touring (2007-2009)
The Elantra Touring is a nice choice for those who need an even bigger wagon. It delivers at least 31MPG highway, is available with a manual transmission, and a 2009 model can be had on the used market with low mileage for about $11k.

Mazda3 (2006-2009) Similar to the Honda Fit, but available a few years older which saves some cash. A 2006 is worth about $7900 with 60,000 miles.

Suzuki Sx4(2007-2009) Useful for those who drive mostly on steep snowy/dirt roads since this car has a cool driver-selectable all-wheel-drive system. With 24MPG city/30MPG highway, you definitely pay for the all-wheel-drive, although it's still better than Subaru's mileage ratings. Should be $7900 for a 2007 with about 65k miles.

Toyota Echo (2000-2005) This car is a dorkier looking mechanical cousin of both the Toyota Yaris and the Scion Xa Hatchback that I own. All are solid, versatile cars (although the hatchback design available with Yaris and Scion is more useful). A 2005 with 75k miles is worth about $6400 for the Scion, $5200 for the Echo.

Toyota Yaris (all years)

Yeah! It's the Mustachemobile!

Scion xA/xB/tC/xD (all years) – Scions are great cars. Designed right down to the last detail for funky usability, they are built by Toyota, but with 95% less High-Waisted-Pants-Grandma attitude. My 2005 has displayed 100% reliability for me over the past four years.. but oops, that's another one of those anecdotal stories you should ignore.

Above Average

Honda Fit (2007-2008) – same as above, but there was an earlier model available during these years which isn't quite as advanced. Still a great car, and the lower price makes up for the lack of bling compared to the 2009+ models.

Toyota Prius (2004-present) – a roomy and practical hybrid that is good at almost everything. For heavy commuting, the approximately 50MPG fuel economy justifies paying a bit more for this car, but the premium on the used models is surprisingly small – 2004 models with under 100k miles go for around $7500 these days.

Ford Focus (2005-2009) This one's an interesting hack on autobuying. The Ford Focus Wagon was not a popular seller in the US, but the Focus line as a whole was the world's best-selling car for some time including in Europe, which definitely says something. The wagon is absolutely cavernous inside – my Mum has one of these and I used it to carry a six-foot-long soaker bathtub, in its shipping crate, plus some assorted lumber and pipes home from Home Depot and I was even able to close the rear hatch. Handling is nimble and fuel economy is about 35MPG highway. Manual transmission available if you search carefully. A 2005 with 75k miles can be had for under 5k on the used market. It also comes in a smaller hatchback form (more common and thus easier to find if you don't need the extra length of the wagon) and a sedan format (why bother, might as well get the hatchback in case you ever have to carry bikes, boxes, etc).

Hyundai Accent (2006-2009) – I had one as a rental once. A solid car, although not as useful as some of the others here. However, low resale value means it may be available at a great price.

Toyota Matrix/Pontiac Vibe (2003-2009) – I love this car. It's a snappy and practical tall wagon with a 37MPG highway rating. Consumer report claims the engine "drones loudly and performs poorly" but I don't know what they are smoking. This is a quiet and fast car that is built like a swiss watch. Just avoid the automatic-transmission AWD models that are out there – slower and thirstier than the front-drivers with manual.

Honda Civic (1999-2009) – everyone loves the Civic. However, with no 5-door hatchback or wagon available in recent years, it is not as useful as other cars, unless you never need to carry large things in the back (and if you don't, you might as well use a scooter instead!).

Mazda Protege (1999-2003) – This is a nice car, now getting very cheap on the used market due to its age. There was a Protege5 wagon available which is fairly useful.

Nissan Sentra (2007-2009)

Nissan Versa (2007+) – Another large-capacity hatchback with good all-around usefulness. A bit larger and quieter than some of the other choices.

Subaru Forester (2003-2009) – A tall SUV-style car with serious offroad capability. Thirsty though.

Hyundai Elantra (1999-2006)

Mazda3 (2004-2005)

Mazda5 (2006-2009) – This is actually a 6-passenger minivan (which still qualifies as a "Small car" by Lemon Aid's standards!?). A 2006 is worth about $6800 used, and you can even get it with a manual transmission which is a great improvement on the standard American Minivan concept. At 22/27 MPG, it is not as efficient as a car, but still considerably better than the beast vans that most people get when they have kids.

Subaru Legacy, Outback (1999-2009) The MMM family owned a 2004 Impreza wagon for a few years. It was trouble-free and sporty with a good roomy cargo hatch, but it drank way too much fuel for a 4-cylinder hatchback. EPA economy rating was 22/28MPG and I rarely exceeded 30MPG even with careful driving. That's why I ended up selling it in favor of the current Scion, which usually exceeds 40.

Suzuki Aerio (2003-2007) – Here's an interesting choice. You can get a 2003 Aerio Wagon for about $2500 on the used market. It's efficient, roomy, reliable, and cheap. Sure, it looks just a tad dorkier than the competition, but that's just a way of flaunting your badassity to the world. I'd show up for Spring Break driving this yellow Aerio any day, and the volleyball game would stop and people would come

running because it would be obvious that Mr. Money Mustache had arrived. Yeah baby!

Toyota Corolla (1997-2009) – this car's name is almost synonymous with practical reliability, although surprisingly it is not at the top of the list. Still a great buy if you can find one at a reasonable price – but there's no hatchback version available (actually there is, but it is styled differently and called the Toyota Matrix).

Average:

Mini Cooper (2008-2009), Chrysler Neon (2004-2005), Hyundai Accent(2004-2005), Kia Rio, Spectra (2009), Nissan Cube (2009), Nissan Sentra (2001-2006), Nissan Versa (2007-2009), Subaru Forester (1999-2002), Subaru Impreza (1999-2009), Suzuki Esteem (1999-2002), Suzuki Verona (2004-2006)

Below Average:

BMW Mini Cooper (2002-2007), Chrysler Neon (2001-2003), GM Aveo (2004-2009), Hyundai Accent (2001-2003), Kia Rio and Spectra (2006-2008), Mercedes Smart Fortwo (2009), All Volkswagen Models including Diesels (1999-2006)

Not Recommended:

Dodge Caliber, Daewoo/GM Lanos and Optra, Ford Focus (2000-2004), all GM Saturn models (1999-2007), Kia Rio and Spectra (2000-2005), Smart ForTwo (2005-2008), Subaru WRX/STI (2002-2009), Volkswagen Diesel models (2007-2009).

Surely many of us have experienced results that don't match what is listed above. Don't take that as an insult to your car, and even the lowest-ranking cars can deliver good results when cared for properly. These are simply the collected results of thousands of drivers telling us which cars have experienced the most failures in real life. From very reliable sources. So if you're shopping for a replacement car some day in the future, you should be able to use these statistics in your favor.

There are many other smart options out there, especially among older cars such as the 1992-1994 Honda Accord Wagon. But the people who shop in those older car ranges usually are experienced enough not to need an article like this one in the first place.

This list is intended a quick-and-dirty guide to help save people who might otherwise find themselves buying a $20,000+ new car on credit because they don't know which used cars are reliable.

Shop well, and you can join the Top 10% – those of us who laugh at the other 90% of Americans who impoverish themselves daily with their tragic vehicular choices.

MMM Forum discussion on efficient used cars for families.

Another one where people are considering whether 3 kids in bulky car seats can fit in the back of various vehicles (aka "3 across seating").

Toyota Prius – Ass Kicker, or Trouble Maker?

By Mr. Money Mustache

Tue, 20 Mar 2012 12:00:31 +0000

Cash-Efficient Cars.

There seems to be widespread confusion about the value of hybrid cars like the Toyota Prius. Are they worth the extra cost? Are they reliable? Do they explode when they crash or actually have a higher environmental footprint than a Hummer?

In the comments to Monday's article about cars, I heard the most extreme claim yet: "Prius batteries only last about 7 years, and after that you have to scrap the entire car".

That pushed me over the edge. It's time to dispel the many stupid rumors that seem to coagulate around this rather amazing car, so Mustachians can consider it on its merits, rather than on the Foxnewsy hearsay that has polluted the public's mind

To get the most up-to-date facts, I interviewed Paul Guzyk, one of the owners of Boulder Hybrid Conversions, an independent company which services the Prius. They also convert the cars to full-fledged Electric Vehicles that you can charge in your own garage and then drive up to 40 miles on electricity alone, before the existing gas engine needs to kick in.

That conversions stuff is exciting enough to get its own article in the near future. For now, let's just destroy the myths:

> "The Prius batteries don't last very long, and when they die, your car is toast". **WRONG.**

This myth may have come from the problems that existed with the earlier version of Prius that was sold in the US from 2001-2003. That car had a smaller battery pack with some design flaws that reduced reliability. Some owners of that generation are now having to replace the battery pack.

In 2004, the next generation of Prius was born, with greatly improved reliability. How long does this battery pack last? We don't even know, because after nine years on the road, very few of them have failed so far. On the short end of the spectrum, Paul told me of one Colorado resident who had his pack fail after only 200,000 miles. On the higher end, I read of a taxi driver in Vancouver who got his first 600,000 km (372,000 miles) out of the first pack, before installing a second one to get to one million clicks on a 2004 Prius. The Colorado resident lives in Denver and works in Evergreen, several thousand feet higher. The long daily climb may be the cause of the shorter service life, since the pack becomes fully depleted each day and left in that condition during the climb, something that doesn't happen in less extreme use (batteries hate rapid discharge cycles, and they hate being left empty).

> "The batteries cost thousands of dollars to replace". **It Depends.**

If you take your second-generation Prius to a Toyota dealer and ask for a new battery, you'll go home about $3000 poorer. If you take it to an independent mechanic who specializes in that type of service, it will be about a grand. The most cost-effective repair comes from buying a lightly-used battery pack from a salvage yard (there are enough of these cars on the road that some get crashed fairly young, providing a great supply of replacement batteries). It takes a mechanic 2-4 hours of labor to do the swap.

A thousand dollars sounds like a lot of money, but when you consider the maintenance that many cars require every 250,000 miles (timing belt, transmission, etc.), it's actually a pretty routine expense. To offset the cost, the Prius uses a lifelong timing chain, rarely if ever needs brake service because of the magnetic regenerative brake assist, and is an unusually reliable car in most other ways as well. And that's before you even factor in the fuel savings.

"The car explodes" **Nope.**

If you really think batteries are explosive, take a cordless drill battery and drop it off of a skyscraper. Now go down to the sidewalk and look at the wreckage. You'll see some broken plastic and some dented metal. Gasoline, on the other hand, is a troublemaker in crashes. The less of it you're carrying around, the better!

"They have a larger environmental footprint than a Hummer" **No.**

A hybrid car uses about the same amount of metal and plastic as a regular car. On top of that, the battery uses a lot of nickel and other mined minerals. You can estimate the environmental impact as proportional to the CO_2 produced when making this battery. Toyota has calculated it to be about 9000 pounds.

You produce 9000 pounds of CO_2 every time you burn 473 gallons of gas. That's about three months worth of driving in a Hummer, or a year in a Prius. In other words, the environmental impact of the battery is negligible compared to the fuel savings it provides. On top of that, Toyota recycles more than 90% of the metals in those batteries when they wear out, further reducing the cost.

"So do hybrid cars save money, or not?"

It depends mostly on the amount of driving you do annually. Since this is the Mr. Money Mustache blog, I'm assuming that you've learned by now that buying a new car is **never** a wise financial move. Thus, we can ignore the fact that a 2012 Prius costs $24,000 while a 2012 Honda Fit is only $16,000. You'd need to drive 27,000 miles per year to get that price difference back over five years, which would be effing insane.

But when we look at used pricing, the picture improves. You can pick up an $8000 Prius from 2004 or 2005. This is comparable to a $6000 Scion or Toyota from the same year. The $2000 price difference only requires about 7,000 miles of driving per year to pay for itself in a reasonable time frame, meaning that buying a Prius in this age range is often a good idea.

But don’t tell anyone else – these battery rumors and other unfounded fears are surely some of the things that are driving down the cost of the used Prius to the current bargain levels. Five dollar gasoline will probably exert the opposite effect whenever it arrives, so get ’em while the getting is good.

Selling the Dream – How to Make your Spouse Love Frugality

By Mr. Money Mustache

Thu, 22 Mar 2012 11:55:24 +0000

Dear Mr. Money Mustache,

I've done it! I have lit the fire of Mustachianism in my own heart, and can suddenly see what should have been obvious from the start: the entire basis for most of the modern US lifestyle is complete bullshit, we are all wasting almost all of our money every day, and we could all be vastly better off if we just stopped doing it. I want to be free, and happy, and rich, and I want it NOW!

There's just one problem. I have a spouse who is still deeply cocooned in the system. He (or she) still loves the fancy shoes, massages at the spa, video game systems, the $2500 bikes, the Apple-brand computers, or the Porsche Cayenne Turbo S minivan for carrying around our 10-pound baby. I love her, but I can't seem to get through to her. I'm shouting through the 8-inch-thick foggy shell of hardened Consumer Mucus that has formed over her entire body, and I can see those eyes I fell in love with staring back at me from deep within that shell. But I can't seem to break her out of it. How can I do it?

Many people are wondering the same thing. I read the question in emails, in the MMM Forums, in newspapers, and I hear the same lament from friends in real life. So I thought this would be a good time to step back and review everything we've learned so far, and put it into the form of a strategy for healing those you love from the disease of Consumerism.

This is Part One of a two part series. This first article deals with the preparatory stages of planting a positive idea of frugality, efficiency, and financial independence into the mind of someone who doesn't yet have it.

Step 1: Realize that your Good News will initially feel like a Punch in the Face

When you're a Mustachian, you know you're on to something. All of life's worst problems have melted away, by the simple act of changing your perspective on life and starting to live it in a better way.

But most people who are still stuck in The System will not see it that way. They have been raised from birth to believe that buying things is the way to solve problems, that buying more expensive things is a source of greater happiness, and that not buying things leads to less happiness. They are taught that there are no consequences to this buying, so the natural response is to maximize the activity: striving to earn more money to be able to buy more. Buying a bigger house to be able to store more of the items. Seeking out the most luxurious experience in every aspect of life. Any unhappiness is assumed to be a byproduct of not having enough money for the right level of luxury purchasing. And any happiness is assumed to be caused by successful purchases that *have* been made.

When you announce to this person that their entire complete framework for happiness is COMPLETE BULLSHIT, they are bound to feel at least a little annoyed at you. So be sure to break it to them gently, focusing on the positive rather than the negative.

Step 2: Paint a Picture of the Destination

Almost everybody likes the idea of never being forced to work. Either not working at all, or having the freedom to work how, where, and when they choose. But almost nobody currently has this freedom. They work because there are bills to be paid, they commute in the dark at obscene times in the morning because that's when you're supposed to get to the office. If you can get this person to imagine their life with a civilized and leisurely breakfast each morning, unlimited time off whenever they feel the need, and bills that automatically pay themselves, you will have found **a point of agreement**, which is the seed from which any true partnership must grow.

Step 3: Use the Emotions of Child Raising to your Advantage

Not everyone plans to start a family. But everyone who does, wants to do the best job they can of raising their kids. They want happiness and success for their present and future children, and they want fulfillment for themselves from the act of raising them. They are willing to sacrifice almost anything to do what they feel is best.

When people are following the Consumer model described in step 1, the natural response is to maximize the purchasing they do for their kids. But here, the model can easily be flipped on its head, because even consumers still realize that kids benefit from time with their parents. Time to read books, play outside, get tucked in at night by both parents. Even the traditional notion of successful children – high academic achievement – has been shown to be most strongly influenced by something that costs nothing to do: *reading lots of books to your young children – every day.*

If you can get across the point that the best thing for kids is time, which costs nothing but requires you to spend a bit less time away from home earning money, a certain level of frugality will start to seem appealing.

Step 4: Show why Money is Even More Useful when you Don't Spend it

> "You only live once, so you might as well spend all your money!"
> "You can't take it with you when you die!"
> "What's the point of money, if you're not going to spend it on the things you love?"

"I'm a big boy and I work hard, so I deserve to treat myself when I see fit."

All of those slogans sound so *sensible,* don't they? But they only make sense until you know the *real* value of money.

The slogans above represent the anthems of the poor and middle-class. But the Rich people know that the thing money is most useful for is ***making more money for you automatically***. A rich person never wants to spend money that they actually earned through work. They prefer to wait until their money starts printing more of itself – and that is the cash they spend.

To most consumers, this concept is a vague and fuzzy one. You're holding up a tablet with Egyptian Hieroglyphics on it, and they are squinting uneasily as they try to read it. If you're lucky, you'll get a response such as,

"You mean, like, the stock market and stuff?"

YES!! Like the stock market and stuff! But don't burden the beginner Mustachian with the specifics at this point. Just point out some very simple rules of thumb. Things like this:

"You can spend $100 right now, and it will be gone forever. Or you can set it aside right now, and it will give you $5 every year, forever."

Which can be followed up like this:

"If we owned our own house with no mortgage right now, we'd have an extra $1500 per month to keep for ourselves – FOREVER. That's equivalent to your boss giving you an extra 26 weeks per year of vacation in your job, with no pay cut. Forever."

If you really want to get advanced, you could say this:

"If we owned the house across the street with no mortgage, we could rent that out, and also get *another* $1500 per month to keep for ourselves – FOREVER!. You could quit your job entirely, and we could still have the same amount of spending money."

Whether your eventual cashflow comes from owning houses or owning businesses (stocks) makes no difference. And you don't have to read a bunch of stock market or real estate books to understand that money pays you money if you don't spend it. But you *must* plant the idea that money is something productive that always works for you, until you give it away by spending it. Otherwise your partner will have no reason to want to hold on to those little employees.

Step 5: Bust out the Real-World Examples

Before blogs like this one came along, there wasn't much to aspire to. You've got your Michael Jordans and your Julia Robertses, who are rich enough to do whatever they want. Then you've got everyone you know in real life: workers who run the 9-to-5-until-65, struggle to stay afloat, and instantly crash and burn the moment the cruel economy does something to them like taking away their jobs. The average person cannot see a connection between these two lifestyles.

But FINALLY, the secret has been broken. A normal man and his wife have retired before even having their first kid – with no basketball skills, unusual good looks, or lottery winnings. They are over six years into the gig and everything is going fine. They're healthy, happy, and the kid is adorable and bright. And what the hell, they even have a nice house and go on trips? And they are telling us that we can do it too, it's just a matter of some very simple math?

Since there is at least one person doing it, it must be possible, right? And wait, it turns out there have been people doing it all along without telling us. This old book from 1993 talks about the same thing, this guy did it on a low single income, this other guy is about to do it sometime next year, and most of the millionaires of the world got there by doing the same thing.

There are very few examples of financial independence among average wage earners, and it's because our culture is built on extracting all of the earnings of the lower class, for the benefit of the upper class. It's just plain old advertising, and sure, we're all immune to it, right? But if you're not yet financially independent, chances are that it is because of the role that advertising has played in sucking away most of what you've ever earned, and probably that of your parents as well. Without advertising, we'd still buy food and shelter, but the rest of our cash would tend to just build up and we'd rapidly have enough for retirement. **Find those few examples, and learn from them!**

We've now covered the preparatory stages of the conversion. This is the mental groundwork you lay for a period of several weeks, or even months. Once the person begins to be at least somewhat excited about the financial independence (and an optional early retirement), you're ready to move on to the next post, where some actual action begins to occur.

Maximum Mustache March – Update

By Mr. Money Mustache

Sat, 24 Mar 2012 12:00:40 +0000

Hiking the Dunes

Wow, this special month of ours is really zooming past.

By the time you read this, the Money Mustache Family will be deep in the high desert of Southern Colorado, camping out at the Great Sand Dunes National Monument.

But I thought it would be handy to share some thoughts on the hardcore savings challenge some of us have embarked upon this month.
The best part of the challenge is simply seeing people excited about hacking their own lifestyle to bring themselves greater efficiency, and having fun in the process. Check out this recent comment from a reader:

> There's still a week left in March, but I'm doing so well! Turns out that by bringing in my lunch every day (why stop at 3-4 times a week?), the frugality seeped into other areas of my life as well – I've gone out for dinner just once per week, and I've done absolutely no extraneous shopping. The results? I'm going to be saving close to 60% of my take home pay this month! I guess saving "at least half" wasn't an ambitious enough goal!

> Next on my list: I'm going to see if I can get my phone moved over to the company plan (fingers crossed!), and then I'm going to break the news to my cats that we're living a frugal lifestyle now and they'll have to make do with slightly cheaper food.

Nice.. very nice. Now I not only have consumer products companies, husbands, and wives begrudging my frugality-spreading ways, but cats as well. I should probably stop publishing my picture all over the place soon.

The MMM family has embraced the challenge as well, with the following points of success:

- The car has only been used three times this month (two for hiking trips just outside of town, one trip to the store for building materials)
- Grocery spending is down, due to more vegetarian home cooking, some tweaks to the menu (food planning article still in the works), and reduced impulse shopping on my part for things like dark chocolate and various organic foo-foo food temptations.
- I made a plan to accept one day of paid work, but it ballooned into about four partial days for various people, yielding at least $600 in extra income for the month.
- We scaled down our road trip – the original plan was to get all the way out to Vegas and even the Grand Canyon, but once we plotted out the days of our young lad's spring break, we realized we could stay plenty busy and have fun without traveling so far. And save a bundle in the process.
- Both Mr. and Mrs. MM. did exactly zero lunches and dinners out, and made zero purchases other than groceries (excepting of course the supplies I bought for my work days, which were billed to clients). This seems to happen pretty often, actually – we already have so much stuff that shopping is only necessary in the rare months that something wears out.

The final thing I did, just to put the Maximum in MMMarch, was signing up for another one of those ridiculously-high-cash-bonus credit cards in order to get the $500 signing bonus. A couple of months ago, I did an article on a $400 business card I signed up for. I was a bit skeptical, but the transaction did go through, I collected the bonus, and I ended up keeping the card and just abandoning my previous business card.

When setting up the credit card referrals page for this blog, I found a $500 Visa card in the mix, so I applied for that one as well. In theory, I will actually get a commission for signing up for a card from my own website, plus the bonus. Now THAT is maximizing the mustache. I promise myself that I won't spend all my free time doing stunts like that, but just this month I thought it would be fun. This is the card I used , in case you decide to try the same thing*.

When you add up all of these efforts, I estimate that I earned or saved about $1900 more than I would have if the challenge had not been thrown down. With so much already chopped out of our spending compared to the average middle classers, I find that income boosting has a bigger effect than spending cuts for our family. But for people with fixed salaries and high expenses, the opposite will be true. Either way, I'm excited to invest my $1900 to further boost the stream of lifelong investment income. (At 5%, it translates to an extra $100 per year for as long as I live!).

Regardless of the specific actions we're all taking for MMMarch, I am hoping that the overall experience turns out to be like the one in the quote above. Setting short-term challenges and making things a game for yourself can be a powerful way to trick yourself into acquiring new habits that actually stick.

In our household, we've created permanent improvements in our eating habits, just from trying a few new recipes this month and finding that they were easy to make and rather yummy. I've really been sticking to my workout regime and expanding on it, and while it seemed like hard work the first week, it now seems like an easy habit to follow from our vantage point here at the end of the month.

I hope you have had a great month as well. What have YOU discovered about frugal living and even extra income this month?

Editorial note: The camping trip has us out until Monday night. Unpredictable writing schedule until then. Try the Random Article Selector above whenever you want to pretend there are new articles.

**Be warned that this blog will get a ridiculously nice commission if you do get the card through my link, so if you don't want that to happen, you can also apply directly on the Chase website.*

Selling the Dream of Financial Independence – Part 2

By Mr. Money Mustache

Tue, 27 Mar 2012 11:46:03 +0000

first post of this series, we laid the groundwork for tempting a spendy spouse into a more frugal future. It was my attempt at combining the necessary logic and psychology that are required to slowly but surely allow someone to change their mind about the connection between spending and lifetime happiness.

In this post, we will move on to some *action* to go with all the talking and book-reading assignments that were part of the first article.

Step 6: Personally Demonstrate Each Change Without Forcing Participation

This should go without saying, but I'm going to say it anyway. If you want to create change, you must first *be* the change you want to see in the world. You want your spouse to start riding his bike to work, so you will start riding your bike to work and demonstrating how easily it can be done. You can take on the grocery shopping and start cooking more at home. You can plan social events for your friends to help create healthier traditions. The former "Beer and wings Happy Hour" can turn into "Bike to work Friday" followed by a cookout at a location that rotates through the houses of various friends. Before expecting your Mustachian Trainee counterpart to take part in these things, you must first master them, so you can serve as a coach.

Step 7: Point out that the Benefits Begin Immediately

"OK, I'll admit that the Money Mustache family has it pretty good, but according to the math you showed me it will still take us 17 years to reach retirement. I don't want to suffer for 17 years, I want to live my life now!"

To understand this argument, imagine a dangerously unhealthy person who is addicted to eating ice cream on the couch. "Sure, I know I could be active and muscular 1-2 years if I stopped doing this and went outside", the person says, "but I don't want to deprive myself of ice cream!".

You would see right through that argument immediately, right? The unhealthy person starts to benefit the very second he puts down the ice cream bowl. He might not feel the benefit immediately – he just feels the craving. But when he goes outside and starts walking, his body starts to rebuild its lost muscle tissue, to suck away the stored fat, and every single thing about his lot in life starts to improve. The trick is getting your spouse to understand that he or she is really making the Ice Cream Addict's excuse.

Explain to them that it has been known for decades that buying things does not make you happy, and enjoying life while spending less money is a skill that develops just like a muscle, as opposed to a permanent state of deprivation. Point out that every dollar you 'stash away is one step further you have moved from the edge of disaster. Every purchase you skip is going directly into a bank of leisure time that you can enjoy at any point you choose. Having greater savings and lower expenses, also known as "Fuck You Money", directly results in lower stress in your life, and increased freedom.

That's right: FREEDOM. What is more worth buying, than Freedom itself? Why would you buy much of anything at all, when you haven't even bought your own freedom yet? Freedom is something that can be bought one chunk at a time and savored. You'll become addicted when you get your first taste. And thus, the benefits begin immediately.

Step 8: Start with Baby Steps

When I first moved to Boulder Colorado in 1999, I was invited by my new Boulder-bred coworkers to go out for a bike ride at lunch time.

"Sure", I thought "I've been riding bikes for years, I'm sure I can roll with these guys".
"Don't worry", they said, "We're really mellow when we ride at lunch, everyone is just out to have a good time.

30 minutes later, we were already 10 miles outside of town, racing up a steep rocky incline under the searing hot sun. "The trail starts just up ahead!" one of them called out, as I coughed out a bleeding lung and shamefully turned my bike to begin the thousand foot descent back toward the city limits alone. "Uhh.. that's enough for me, I'll catch you guys back at work".

The casual lunchtime ride of these experienced cyclists was much more extreme than even my biggest bike expedition before that point.

And so I know that Mr. Money Mustache can seem extreme to people who come across him for the first time. It's because I'm old now, and I've been doing this "buying less shit" shit for a while. The natural path of any enthusiast is to get a bit more hardcore over time, so that the Enthusiast's "normal" normal is the average person's "Insane Cuckoo Bird". I don't think I'm weird to pull 100 pounds of groceries home on a bike trailer through a blizzard on a winter night, but I must also acknowledge that a non-biker is better off starting out by just riding their bike to the library on a warm Sunday in April.

That's a lot of biking analogies, but this isn't really about biking. I'm talking about *any* lifestyle change. Choosing more appropriate housing. Changing your eating. Reducing your gadget buying. Not watching television. All of these things have a beginner stage, followed by a continuum that leads up into hardcore territory. On this blog, I talk about a moderately hardcore level of lifestyle changes – the type that allows my own family to live on $700 per person per month. You don't have to start at exactly this level. You just have to know it's there, waiting for you to eventually reach. And then perhaps surpass me so you can mock my wasteful lifestyle as other senior Mustachians do in the comments section.

Step 9: Budgets and Allowances are Baby Steps too.

In the realm of Frugality, the equivalent of the slow April bike ride is **the budget.** My long-term goal is to have you enjoy frugality for its own sake, without requiring a budget to keep yourself from overspending. I've never used a budget in my life, because I like to control my spending consciously instead – it can go down if there's ever a need. But for beginners, starting with a budget or a monthly "fun stuff" allowance can be a good set of training wheels.

A beginner consumer is like an alcoholic who has a vodka dispenser in his kitchen, connected to a pipeline that runs directly to Russia. His consumption is limited only by his ability to stay conscious. If you take away his tap and replace it with a vodka dispensing machine that plunks out one 750mL bottle every 24 hours, which he desperately downs as soon as it shoots out, you HAVE improved his life somewhat. But he's still not going to be happy about it. He needs to keep developing his self-control, until he realizes that he's got better things to do with his life than drinking vodka at all.

Similarly, a weekly allowance to blow on massages, lattes, and plastic trinkets from Target is a good start. But it's not a great lifelong solution. The ideal solution is having *an unlimited budget*, but finding that you get more pleasure out of not spending it, than you do from spending it.

When I proposed a similar concept in an old article called "How Much is That Bitch Costin' Ya?", I took some heat in the comments. *"I get an allowance because DW can not only squeeze the eagle until it shits, she can also snap its neck and reach in and crush its heart"*, is how one University professor expressed his take on the benefits of budgeting.

I can definitely see the point and the benefits of the personal fun allowance. But I can also see what life feels like *beyond the allowance*, and I can tell you that it is a liberating place. Mrs. Money Mustache and I have an effectively unlimited fun budget. We have virtually unlimited savings, no rules, and we don't consciously watch each other's spending. Yet we still end up buying very little each month. It's because we've *solved the wants themselves* rather than just setting a limit on how much of our wants we're allowed to indulge.

The important part is to realize that you can always go further. You are always a wimp, and there is always someone more badass than you. Within badassity lies the key to happiness, and I think everyone has a certain respect for awesomeness in its various forms. The key is to make the mental connection between frugality and being awesome. This will become easier over time as the entire world starts doing it, now that I have revealed that Frugality is the new Fanciness.

Step 10: Keep it Fresh with Challenges

The habit of living efficiently definitely feels good. But just like with any sport, you can increase your performance by making a game out of it.

When you issue a challenge to (or accept one from) another person on the financial independence track, you increase your own motivation. All through this month of March, I felt the eyes of the MMM readers upon me, searching for weakness or fraud, and this improved my behavior considerably. In the Forum of this blog, we even have a section called "Throw Down The Gauntlet" for people to trade ideas and challenges. Even for the more introverted personality types most found reading financial independence blogs, this silly competitive stuff works.

When living with another person, finding ways to induce competition is especially powerful.

Last Step: Build the Good Type of Addiction – with Tracking

Spending less money exerts a calming force on your life. But to build your motivation, sometimes you need excitement rather than calmness. For people on the path to riches, some of the excitement can come in the form of tracking your results. Memorize the logins and passwords to your key accounts for both investments and debts, so you can see real change each month. Keep a "net worth" spreadsheet, fiddle around with retirement calculators, and use any other financial software that you find enjoyable. Watch your index funds on finance.google.com. I'm still happily using the free web-based Mint to do all of the above, frequently reviewing my monthly spending and saving as well as graphing changes in net worth.

If YOU are already a saver, and you want to convert a spouse, you must get him or her hooked on seeing her own wealth. When she saves, it grows. When she spends, the growth stops. Every three months, the dividend payments come in. When the stock market crashes, she gets excited about getting more shares at a lower price. Try to build the idea that the *number of shares* and the *dividends* are the part that matters, because you don't want to breed a fearful anti-investor who feels like selling shares instead of buying them, when the prices go down.

Final Words:

We've covered ten important steps to creating a newly frugal person. We've combined psychology and action. But although these are the steps that have helped me persuade various people, there is no perfect recipe for everyone. The biggest tips of all are to be patient, be positive, and **be persistent.**

Not everyone has the same reason for wanting to embrace frugality – if you love your job, you might not be motivated by the idea of quitting. If you're already rich, you might not even be motivated by becoming financially independent. But I strongly believe that *everyone* can find a better life for themselves by minimizing their material wants and needs, and instead maximizing the learning they do about themselves and about life itself. You've got a real shot at having a great life here – as long as you don't let consumer culture distract you from the true goal of living well.

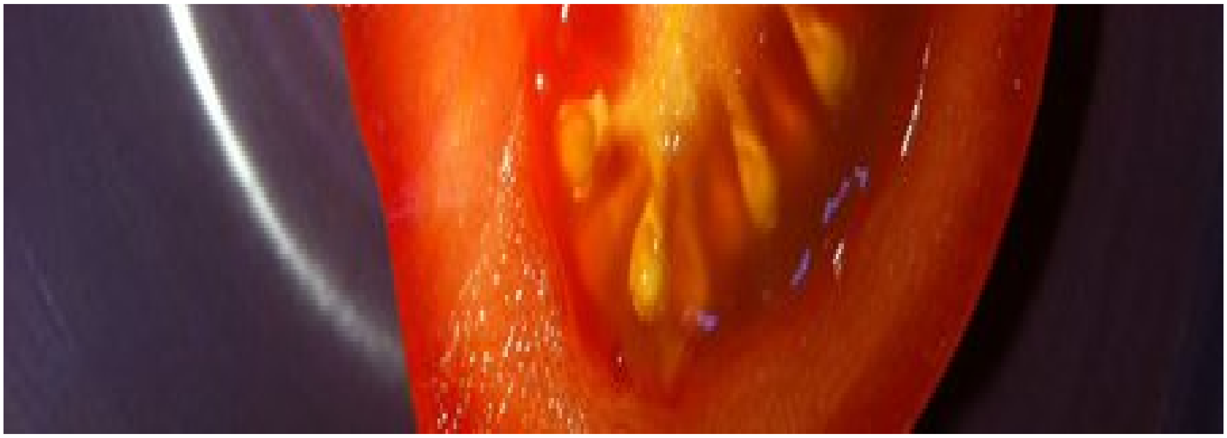
And for those who are not yet attached – be yourself, and don't be afraid to show your independence. While inappropriate and misguided cheapness won't get you laid, true badassity and a desire to not to be wasteful is *sexy*. Live that example, and you will be rewarded with a mate that is as sexy as you, perhaps saving you the effort of working through these ten steps the next time you hook up.

Epilogue: About a year later, my financial blogger friend The Mad Fientist published this inspiring post on the same topic:

Killing your $1000 Grocery Bill

By Mr. Money Mustache

Thu, 29 Mar 2012 12:26:38 +0000



A few years ago, I was at a party eating some amazing food at the potluck buffet. In my area, there seems to be a friendly competition among the thirtysomething outdoorsy tech worker crowd, of trying to out-chef each other. It's a contest I heartily approve of and I am happy to be both an underdog competitor and a judge.

Anyway, the topic turned to how good we have it in our lives, with such plentiful food that we can afford to spend hours combining exotic ingredients just for the sake of overfilling our bellies.

"Yeah… I know it's a bit over the top", I said, *"but we probably spend 80 bucks a week on good groceries. I think it's worth it if you can afford it"*.

"Eighty dollars a week on food for the three of you? That's IT??", said a friend, *"We spend more than three times that amount!!"*

"Whoa", I replied, *"I guess I'm not as spendy as I thought"*.

Of course, the person telling me about her high food bill was more of a typical high-income spender in many ways. Her family also took out loans to buy new cars, had at least one $2500 carbon fiber road bike gleaming in the garage, and hired out the household chores to allow them to conveniently work a double-career-with-kids while still taking plenty of short vacations involving air travel. Looking back, I probably could have predicted a non-Mustachian grocery bill.

But the experience still reminded me of the amazing variety of spending levels we all have available to us here in the United States. It is simultaneously one of the cheapest industrialized countries in the world to live in, *and the most expensive*. It all depends on the choices you make in your shopping, because everything in the world is available right here for your buying convenience.

When you look it up, the average food cost for a family of four in the US is way up there at the level of my friends, at $944 per month. But to call it "food cost" makes it sound like it's out of your control. I would call this the average food *spending*. Just like the average family's *transportation cost* is not some fixed punishment that the cruel world imposes on them… it's a measure of the *amount of driving* that they have designed into their lives, multiplied by the level of inefficiency of the vehicles they have chosen for themselves.

Instead of shooting for the average, you can design your own food spending.

Let's say a family of four wants to spend only $365 per month on groceries, saving them $579 per month over that USDA average family in the link above. Investing this savings would compound into about **$102,483.00 every ten years**, which would obviously make a pretty big improvement in the financial health of the average young family.

To hit a monthly grocery spending target like that, you first have to understand what you are buying. There are four mouths to feed, each consuming three meals a day or 91.25 meals per month. Let's say they all need adult levels of calories, so about 2000 per day.

To meet this level of grocery spending, each meal needs average out to about $1.00 per person, and provide about 667 calories. Of course, there can be plenty of variation in the cost and calories, and you might eat 6 smaller meals and snacks instead of three big 667 calorie blasters. But these are the fundamental numbers we'd need to hit.

Can it be done? Coincidentally, this is about the level of my own grocery spending when I'm in semi-frugal mode (if you scale it down to 3 people and $273/month), and in the non-frugal mode mode we currently shop in, we spend closer to $365/month for three people, resulting in a cost per meal of $1.33. So the answer is a definite **Yes.**

All of us eat very well, with a fair amount of luxury spending thrown into that amount – the grocery spending includes gourmet coffee every day, a lot of organic and gluten-free specialties, food for parties, and other things that you buy when you're not worried about cashflow at all. Plus I consume far more than my share of calories due to all-bike transportation and physical labor, my son is growing about six inches a year, and Mrs. Money Mustache does crossfit workouts three times a week, increasing her food needs as well.

"But damn, a buck for a whole meal?", you might say. *"That's the price of a shitty Burger King dollar menu mini burger on a soggy white bun – BEFORE TAX!"*

Luckily, I don't eat at Burger King, and neither should you. But let's see how much it costs for 667 calories of some actual food staples that *should* be part of your diet:

Cost per 667 calorie "Meal" of common foods:
Basmati Rice: 25 cents
California Almonds: 80 cents
Organic Extra Virgin Olive Oil: 57 cents
Spaghetti noodles: 28 cents
Black beans (uncooked): 49 cents
Natural (peanuts only) Peanut Butter: 53.36 cents
Bananas: 92 cents
Potatoes: 57 cents

Canola Oil: 14.38 cents
Cheddar cheese: $1.09
Apples: $2.79
Organic cage-free eggs: $2.85
Organic boneless skinless chicken breast: $8.00

Aha.. now things are sounding much better. Although not all of the foods above cost less than $1 per meal, they can certainly average out to less than that, depending on how you combine them. And when planning your menu to meet a certain budget, averaging out is exactly your goal. You still want to be able to eat apples, organic chicken breast, or whatever your heart desires. You just have to not eat *entirely* those most expensive foods.

And remember, this $1.00 target is just something I picked out of a hat for an example – you're allowed to spend whatever works for you.

Whole oils are the ultimate example. They are packed with tasty, slow-metabolizing calories, extremely good for you, and easy to mix into your diet. Using olive oil as an example, you can one third of a day worth of calories for 57 cents. Every time you dump these oils into a frying pan, or mix them into a recipe or a salad dressing, you're lowering your food cost – the oil provides calories that your body might otherwise get from cans of Coke, Filet Mignon, or Burger King dollar menu burgers.

And contrary to the 1990s low-fat-diet fad, the human body *loves* oil. It's yummy, clean-burning, good for a giant range of body functions, and it is satisfying to eat too. I eat a fairly high-fat/low-carb diet these days, yet I'm leaner than ever, because the oily food doesn't cause spikes of fake appetite like bread does. I've even been known to bring containers of herb-infused olive oil on road trips, supplementing every meal with this supercharger nutrient, especially when it's time for an extreme hike or a high-energy work day.

See Article: The Amazing Waist-Slimming, Wallet-Fattening Nutrient

Similarly, you can mix other foods from the under-$1.00 list into meals, freeing up space for expensive garnishes. Chicken and rice recipes with oils, spices, and vegetables are delicious and can be made in many different styles (Asian, Mediterranean, Indian, Mexican) while still coming in at under $1/meal.

For snacking, I usually eat handfuls of roasted almonds and other mixed nuts, combined with fresh fruits and vegetables. The nuts provide most of the calories, while the fruits provide the various nutrients and healthy stuff.

But What about Protein?

These days, the high-protein diet is back in style, especially among followers of the "Paleo" diet/religion. I am also a big fan of the nutrient, since it's handy as part of strength training and exercise. Unfortunately, most people equate "protein" with "meat", which is the most expensive way to get protein by any measure.

An average person might want to shoot for about 75 grams of protein per day, while an athlete might consume 150 grams. As a fairly regular weightlifter and manual-laborer, I go for the higher number myself.

When you eat beans and rice in the same meal, you're getting complete protein at virtually no cost. Nuts and especially peanut butter are also a good way to mix high calories with built-in protein. **Eggs** contain the highest quality complete protein of all (6 grams per egg), so I enjoy three of them every day.

Protein from high-quality meat and fish costs about 4 cents per gram, which would already put the Paleo-eating athlete over $6.00 per day just for his meat intake. Eggs come in around the same protein cost, although at lower environmental cost and with a lot of good calories and other nutrients as a side benefit. But plain old milk, or whey protein powder from Costco, Sam's Club or an online source like Swanson Vitamins provides protein at about 2.5 cents/gram – cutting the bill by 40%. So to hit my own 150 grams during a period of heavier training, I include the eggs, nuts, cheese, a lunch or dinner that includes some meat or fish, and throw in a mid-morning protein shake (banana, milk, yogurt, whey protein powder, pure cocoa and maybe some ground flax or whatever is lying around) for an extra 40 grams of protein.

The key is to look at the protein content already in your basic staples before deciding how much you need to supplement it, and then do so intelligently based on your own activity level. The average American diet is actually quite oversupplied with protein, due to the fact that most people eat meat with every meal, even while most are not competitive weight-training athletes. The opportunity for savings is enormous.

Where to Get your Food

Not Here

To research this article, I biked over to the health food store in my town, a place called Natural Grocers that attempts to imitate Whole Foods. It seemed like a friendly place, where the customers are unusually slim, the bike rack sees frequent use, and everyone brings their own cloth grocery bags.

But Holy Shit, were the prices ever ridiculous there! In one quick tour of the store, I observed a package of four "Bison hotdogs" priced at $11.85, a two-pound bag of plain Tilapia filets at $25.00, and jugs of organic milk at $11.00 per gallon.

All of these prices are more than double the levels of the nearest Costco, which is one of the best places to shop for your calories and protein, unless you have even better options in your area. The prices I quoted in my $1.00 meals table above were Costco prices, and unless you already have unlimited money, you should stay miles away from Whole Foods or any of its cousins.

At a more community-oriented level, there are also good deals to be had in Mexican, Indian and Chinese grocery stores, Community-supported agriculture groups (CSAs), farmer's markets, your own vegetable garden, and other old-fashioned sources. When the parking lot is not full of hybrids, there are international phone cards on display in the window, and the cashiers also stock their own shelves and do not speak much English, you are probably onto something good.

What to Eat

Finally, the fun part! As the wise people of India have proven beyond all other cultures*, amazing food is all about preparation and spices, rather than starting with costly ingredients. Once you know which ingredients make good staples, you can easily poke around on the Internet or in any cookbook to find an infinite number of good recipes that use them.

At the simplest "bachelor" level, you've got recipes like:

Fancy home fries:

Slice up about five big potatoes into thick french fry shapes, mix them around in a giant bowl along with a huge amount of canola or olive oil (maybe 1/3 cup), garlic, black pepper, cayenne pepper, paprika, and/or any spices you like (even curry!). Cook at 400F for 25 minutes on a metal tray.

Ding! You've got thousands of calories of deliciousness to use as a side dish, snack, or even combine with a salad to make a simple main meal.

At the next level, you can move up to I have been making regularly for years now:

Thai Curry and Coconut Butternut Squash Soup:

1 large butternut squash, about 2.5 pounds
1 tbsp oil
1/2 an onion, chopped up very small
1 tbsp freshly grated ginger
4 cloves garlic
2-3 tsp Thai Red Curry paste
4 cups chicken broth
1 13-14 oz can unsweetened coconut milk
1 tsp salt
2 tbsp freshly squeezed lime juice

Fancy optional things:
Some toasted coconut for garnish
A few kaffir lime leaves, chopped up a bit

Cut the squash in half, take out the seeds, brush it with oil, and bake it for an hour at 400°F. Then scoop out the soft squash with a spoon when it's done.

Fry the onion, ginger and garlic in some oil for a few minutes. Add the curry paste and cook for a few more minutes. Stir in the chicken broth, coconut milk, salt, squash and shredded lime leaves. Simmer for 15 minutes. Remove from heat and stir in the lime juice.

Finally, blend up the contents of the pan in a blender or a bowl with a hand mixer. Serve in colorful bowls with the garnishes.

This soup is extremely filling due to the deliciously high fat content of coconut milk, and so good you will not believe it came from your own kitchen. It also stores well in the fridge and freezer, and can be brought to work or on road trips and reheated anywhere.

Those are just two simple recipes. The key to frugal eating is to have at least ten good things you know how to make.

There are many chefs among the readers. Maybe we will get to hear some of their best low-cost and easy-to-make creations in the comments section below?

Further Reading:
Grocery Shopping with your Middle Finger – an old MMM classic on this same topic, where I first started thinking about cost per calorie. But there I was dealing with food stockups and sales rather than thinking of it on a per-meal or per-month basis.

** According to the strong opinion of my own taste buds*

Guest Post: Why is it So Hard to Downshift?

By Mr. Money Mustache

Sat, 31 Mar 2012 12:00:06 +0000

Today I'd like to share a guest post from an interesting new reader to the blog. This guy, Jason, showed up here from some random Twitter surfing, and had this to say to me:

> I would like to write a guest post for your readers. As far as I know, there hasn't been too much written about the emotional hangups that you have to get over when adjusting to a more frugal lifestyle. Everyone says "Just Do It! Just sell all your unnecessary things, cut your bills, and just live simply! Come on! It's Easy!"
>
> And yet, as far as I know, no one has done an adequate job of tackling the emotional "HOW" that this sort of transformation takes. Bloggers just assume, "Hey… you're here. You must already have it under control…"
>
> I understand it because I've been living a huge emotional down-shift for the past two years, and I've had the freedom and time to understand it. It's been excruciatingly detailed for me. I've had to tackle every emotional hangup headlong I had that was keeping me

poor and hopelessly unsuccessful. Now, I'm able to see the same problems in others that I once had.

I want to write such a post for your readers so that maybe it can help them clear the 'imaginary' hurdles they may not know they have.

WHY IS IT SO HARD TO DOWNSHIFT?

Perhaps you need a new clutch… or perhaps you simply posses an unimpressive Money Mustache and would like that to change. In the latter case, it's likely that your life is overly conceptualized. Now what does that mean? It means that growing up in the modern school system you were probably treated to a concentrated barrage of ideas that were intended to get you to idealize life slightly more than is healthy—all with the hope that you would one day grow up and cure cancer. Have you cured cancer yet? No? In that case, let's examine the emotional obstacles you may face while aspiring to Badassity:

ENTERTAINMENT ADDICTION
The urge to be entertained every waking second will be the first hurdle you will need to clear. It's like when your parents chided you for staying up past your bedtime because you "were afraid someone might fart and you wouldn't get the chance to smell it." Your brain has been conditioned to grow from exposure to near constant stimulation. If you're not doing something, you feel like you're wasting your life.

Entertainment addiction rears its ugly head whenever you watch something you've already seen, hang out with friends you don't like, "go out" on a habitual basis or aimlessly browse the internet. The addiction often stems from the concern that you will be left behind.

But watching the newest episode of Grey's Anatomy or the latest kitten video on Youtube doesn't promote you to the next grade level in the adult world. It just makes you less of a real person and actually sort of dull. Once you begin cutting back on your entertainment over-indulgence, plan on the next menace to rear its ugly head; namely Boredom…

BOREDOM

Now that you've stopped drugging yourself with constant mindless stimulation, you have a whole bunch of free time. Great. That's when Boredom sets in. Boredom used to have a different name back when people primarily worked with their hands. It was called "REST".

With the decline of physical labor jobs, those who make a living with their mind muscle have begun to put in all kinds of ridiculous work hours that normal people with bodies wouldn't even dream of. Think about it… You wouldn't dig ditches for 80+ hours/ week, so why would you work on demanding legal cases for that long?

You can be emotionally drained just as easily as you can be physically drained. We've simply found a whole host of creative ways to ignore our emotional needs (*cough* *entertainment!* *cough*). If you regularly feel stressed, chances are you need emotional rest, and lots of it.

But what about when you don't feel tired anymore, yet still have plenty of free time on your hands? No, it's NOT time to go back to entertainment. It's time to get to know your best friend in the whole world…

YOUR BEST FRIEND

Besides a well groomed 'Stash, your best friend in the entire world is none other than: yourself. Who's always been there for you? That's right; <u>you</u> have.

And you haven't been treating your best friend very kindly. If you're like most people, you've probably even been downright neglecting her. Why is your best friend so easy to ignore? Because she's shy and only feels compelled to talk when it's quiet and there's plenty of time.

ALL of your problems with developing a superb cash-hoard lie within your best friend's quiet lips. And she'll only tell you why your life is such a mess if you give her the time. SO NOW IT'S TIME TO TAKE ACTION!!!!!!

ACTION!!! ARGHHH!!!!

… by simply doing nothing. Now that you've removed the entertainment that's been keeping you anaesthetized to life, you've rested, and finally decided it's time to understand how your life got so messed up in the first place.

It's time to just sit silently and listen — for a good long while. Angry things may begin to come up. You'll begin to think about all the horrible emotions you've squashed back down into your neck-hole because they weren't convenient or comfortable at the time. You'll remember the time you made your mother cry. You'll remember that little boy you couldn't help. You'll remember all the feelings of fear and hatred and self-doubt and guilt and loathing that have ever refused to leave your body.

You may feel nervous, doubtful, agitated or anxious. It might all rush out like a geyser, but that's okay. You must let it all come out. Don't suppress or hold onto any of it. Acknowledge and release every bit. Eventually it will all slow to a trickle and something amazing will happen: silence. Real Silence…

SILENCE
Suddenly you'll be alone with yourself, and there will be no one else there. Nothing will exist but your thoughts. Lingering thoughts tend to be agitated thoughts, so hopefully even these will drift away. This nothingness can be rather scary initially because it's your original state—the real you. Finally, it's time to ask yourself some important questions.

Ask yourself:

"Why do I desire a Starbucks Grande mocha-latte-chino-frappe-ding-dong every morning before work?"
"I think it's because they taste good."

"Why do I desire a Starbucks Grande mocha-latte-chino-frappe-ding-dong every morning before work?"
"Maybe it's because the caffeine makes me feel peppy in the morning?"

"Why do I desire a Starbucks Grande mocha-latte-chino-frappe-ding-dong every morning before work?"
"It's because my parents were abusive when I was young, and before I had a chance to fully express myself as an individual I had children of my own.

So I feel the need to treat myself from time to time because it hurts that I never had a chance get to know myself. It's also the reason why I waste cash buying my children lavish gifts they neither need nor want, at every opportunity."

Ask yourself:

"What do I really need to be happy?"
"I need a huge house in the hills and a car and a boat and $100k salary."

"What do I really need to be happy?"
"I need lots of friends and family; to be utterly surrounded by people who love and adore me."

"What do I really need to be happy?"
"I'm happy right now."

You get the idea. Ask any and all questions that stand between you and financial independence.

GLORIOUS MONEY MUSTACHE SEEDS
Something happens when you are able to recognize and give a voice to the reasons for your afflictions: they go away. These were the weeds that plagued your barren savings garden.

Once you understand and acknowledge the reasons why you do the things you do, bad habits tend to get released on their own. You must be careful, though. This powerful technique of Mustache-Foo comes with risks of its own. It should not be used as another method of escapism! Don't just sit around doing nothing because now its time for… wait for it… ACTION!!!!!

ACTION!!! GRRRR!!!!
Once you've successfully cleared away the dark things that had made nests in your soul, you'll want to begin the process of transferring that silence you found inside of yourself out into everyday life. Keep in mind: that was the real you. Bring this silence into your daily chores and you will begin the process of making yourself whole once more. To do so turns reality into its own pleasure.

Do only one thing at a time. Wake up early one morning. Make tea for yourself and slowly eat a bowl of oatmeal — without sugar. Enjoy everything you possibly can at face value, from within your own personal silence. It's all you'll ever really have, but it's enough.

MMM Note: You can follow more of Jason's philosophical thoughts on Twitter if you want to follow him at https://twitter.com/#!/Jsn_Br

What Would You Do with WAY MORE Money?

By Mr. Money Mustache

Mon, 02 Apr 2012 12:00:04 +0000

One of the things that happens when you get older, living in an affluent area of a rich country, is that the concept of gigantic amounts of money becomes commonplace. There are wealthy people sprinkled all over the Boulder County of Colorado where I live, and to a certain extent, this wealth is contagious.

People with high incomes and consumer habits will gladly fork over great sums of money for luxury products and services, enriching the owners of landscaping companies or car dealerships or salon/massage/spa outlets. Entrepreneur-minded wealthy people and companies will fork over top dollar to hire talented people to work for them, in hopes of growing their own businesses, creating even more wealthy people in the process. And wealthy families will dump buckets of cash this way and that in the hope of ensuring successful upbringings for their children and grandchildren.

Living in such an area, and being retired from what I consider to be the cushy field of software engineering work, Mrs. Money Mustache and I have occasionally had brushes with the opportunity to amass one to two additional shitloads of money for what sounded like not very much work.

Several years after she quit her job, her company called her back, eagerly suggesting that she return to a position several levels up the ladder that would have paid twice her previous salary. It was a very exciting and tempting offer, but she was still able to quickly decline it. When I quit my own job, I gave up an estimated $900,000 of salary and stock option proceeds over the next five years. Since then, I've passed up job opportunities that would have paid even more. Even now, the autotuned pop song of the Extreme Cash Goblin is playing in the background, with fantasies of million-dollar-real estate deals, or hell, why not, blogging empire proceeds that would blow away all past earnings.

I'm not going to lie to you. My *name* is Mr. Money Mustache, so you can tell that I find the topic of money to be pretty interesting. So whenever one of the opportunities comes up, I get a little fidgety and excited, and my heart beats faster. "Ohmigod! I could be a super-multi-millionaire! I could earn and save so much more if I took this job, that I'd have a WAY higher retirement income for the rest of my life after I finished it. I'd have so much money that I would… ummm.."

Do absolutely nothing differently.

Strangely enough, even though the money sounds exciting in my fantasies, they always end up back in the same place – with me tucking away all the extra cash somewhere useful and then going right back to exactly the lifestyle the MMM family is currently enjoying.

In the olden days, I would have had a much better answer for you. There would have been seaside compounds in Hawaii, fleets of Teslas plugged in to the 26-car garages in my mansions in all of the world's hotspots. Air travel via the Gulfstream G650, Playboy Mansion Grotto areas beside every pool, and whatever else money could buy. The fantasies were fun to indulge in.

So when I noticed over the past few years that my fantasies had disappeared, and now I couldn't even rake up the desire for a 2010 Prius in response to my imaginary millions, I felt a little bit empty and cheated. "What good is several more shitloads of money, if you don't even have any desire to spend it?", I found myself asking.

"Aha!"

The answer was of course that when it comes to buying additional treats for myself, the extra money is in fact *no good at all*. And that was a very liberating thing to figure out. I have completely lost the desire for any more of the things money can buy than I already have, which means I have completely lost any form of envy, any sense of deprivation, or any sense of missing out on *anything* – no matter how many rap videos I watch or over-the-top houses I visit.

Some people would question this assertion. "Sure, Mr. Money Mustache claims to be happy living on $2000 a month, but that's just because he's good at fooling himself. He doesn't even go out to restaurants several times a week! If this guy could see my new Jeep Wrangler Unlimited and cruise the beach strip a few times, I could shake him out of it. I think it takes WAY MORE MONEY to be truly happy."

But after punching that guy in the face, I'd question his questioning. As one form of proof, I'd offer the fact that I actually *do* have way more money than the amount required to sustain our lifestyle while never running out, and I'm still perfectly happy not spending it on myself. We actually want to find ways to need even less over time, just because it feels like the right thing to do, and the *happier* thing to do.

What could be the explanation for this unusual lack of wanting? How is it possible that almost everyone in this country, even people much wealthier than me, wants more money, but a small minority of us are more than content with what we have?

I think it's a combination of two things.

Logic: I put a lot of effort into figuring out how to have the maximum possible amount of fun in any given day and week. **The availability of time is always the limiting factor**, not the number of amazing activities to choose between. Spending more money can only broaden my list of options even further, without giving me more time. It would be like adding another fifty pages to the menu at the Cheesecake Factory restaurant. There are already more choices than you can even read before the waiter grows impatient with you. Just pick something and start eating already.

Practice: in order to attain early retirement in the first place, you need to spend much less than you earn. This process, far from being a temporary deprivation, actually cures your want for many things, so that even when you can afford them, the needy want is no longer there.

The ideas above will sound cuckoo-bird to the most junior Mustachians, and "well, duh" to the most advanced ones. And really, that's as it should be, because this article is a bit of a test for you.

If your goals for the extra money involve simply paying off the rest of your debts and living the financially independent life you were already planning before I gave you this extra $5-$10 million, then you've passed the test – you'll do well in the uncharted and very adult world of complete freedom.

On the other hand, if you started adding just a few niceties, like a second house up by the ski resorts for those family gatherings, and maybe just one new SUV to get back and forth to it, and oh, maybe just a bit more four-star-resort international travel, because hey, with $10 million, you could easily afford those things… I'd say you're not completely free yet.

Your personal freedom grows with each material desire that you grow out of.

If this sounds a little bit too bleak and Buddhist to you, don't worry, there is still hope. Even after you lose your material desires, there's still plenty of fun to be had with money, in the form of trying to do some good. I'm a real beginner in this area, with little fantasies of fixing up my own neighborhood, helping the school, buying up the crappy vacant lots in the middle of the city and turning them into public orchards, and things like that. Over time, hopefully this can grow to something bigger in scope.

There's always work to be done, so never fear that all the energy you're putting into your day job will go to waste if you decide you no longer need the earnings it provides.

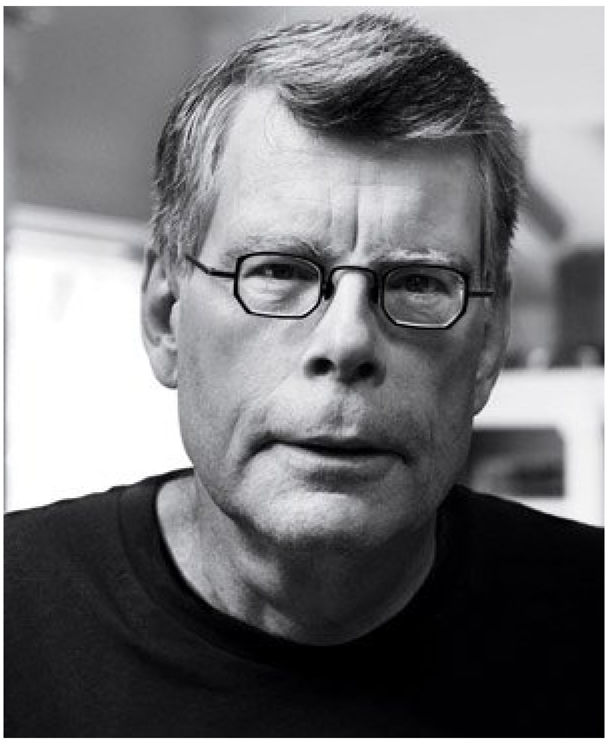
But for now, just keep note of your desires and see if you can detect them fading away over time. It may sound strange, but they really will start to slip away from you.. and you won't miss them when they're gone.

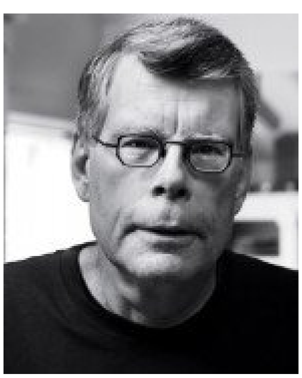
Further Reading: coincidentally, a blogging friend named G.E. Miller happened to post this alternate take on the concept at almost exactly the same time as this article came out: http://20somethingfinance.com/mega-millions/

Reader Case Study: Working a Crappy Job – for Nothing

By Mr. Money Mustache

Wed, 04 Apr 2012 12:00:14 +0000





Stephen King can

afford to drive a
Murano. You
cannot.

Dear Mr. M.,

My wife and I have been reading your blog, and slowly feeling some of the free-spending ways of our past slipping away from us. But it's a slow process, and while my wife takes after her frugal immigrant parents, I am not sure if I am quite ready to step up to the plate for MMM-level badassity. I like my toys and my microbrews!

But we have an incentive to get there: two beautiful little boys, ages 1 and 4. The wife and I both work, and we are able to cover our bills with just a little bit to spare each month.

The issue is that while I love my own job (I'm an elementary school principal), she hates hers (marketing department of a midsized firm). I believe her dislike for the job is well-founded: both her boss and her coworkers all sound like they're training for the world Douchebag Olympics.

She'd love to stay home with the kids, but when we do the math, it looks like we'd fall short of what we need to live on, if we lost her salary. Maybe you could have a look at the details and see if we're missing anything:

Income:
Me: $80k/year (roughly $5,000/month after taxes)
Wife: $40k/year ($2800/month)
Also, we're both contributing to employer-assisted 401k plans which leaves our net take-home pay at about $5800

Expenses:
Mortgage Principal+Interest+Property tax+Insurance: $2000 (Mortgage balance $250k at 5%, fairly high taxes, insurance is $70/mo)
Utilities: $150/month

Mobile Phones/Internet/Cable: $200/month
Car payments and insurance, oil changes and other maintenance (2009 Nissan Murano and 2008 Honda Accord, about half paid-off): $900
Gas: $250/month (The school where I work is only 1.5 miles from home (yay!), wife's job is 25 miles (40 minutes mostly highway) away (boo!))
Child Care: $1500/month (which is actually a great deal in my area for two kids, full-time)
Groceries: $400/month (after reading your latest article, I noticed we eat very similarly to you)
Miscellaneous: clothes, entertainment, other: $300

Total: $5700

What we're seeing is that even after subtracting child care, we'd be in the red if my wife quit her job as she wants to do. But our food and entertainment spending is already pretty low. We don't go shopping. There's no vacation budget. Where's the money going?

Principal S.

Dear Principal S,

I've got some bad news and some good news. The bad news is, your wife has been slaving away at her awful job at a ridiculously far-away office building, enduring those frequent Showers of Douchery, and missing out on raising her own children, **for VIRTUALLY NO PAY!** The good news is, she can bring a big cardboard cut-out of a middle finger to work with her TOMORROW, and duct-tape it to her boss's desk, because she is done with that joint. Here's why:

First of all, her driving is absolutely ridiculous. At 50 miles per day x 250 workdays each year, she's spending at least $6250 of her after-tax money per year ($521/month) on the mileage costs alone, budgeting at 50 cents per mile. And that's on top of the insane **22,500 minutes per year** of high-speed life-risking driving time she takes out of her life to get there.

Secondly, your vehicle fleet is off-the-hook. What the hell do you need a 2009 Nissan Murano for!? Bought on CREDIT!!?? If you're Stephen King, and your $15 million compound in Maine sits atop a 1500 foot cliff with a 45-degree rocky slope of a driveway that is snowbound for four months of the year, THEN maybe that's a valid vehicle choice. But for the rest of us, the Murano is strictly for comedy relief, as it's such an impractical vehicle.

So here's your prescription:

1. Sell the Murano (book value: about $16,000). Use the surplus cash to pay off the remaining balance on the Accord. If you don't have enough cash for that, sell the Accord too (value $11,000) it and buy a less costly car like a 2003 Matrix or something else from the MMM Cars for Smart People List. NO CAR LOANS ALLOWED! **Monthly Cashflow Improvement: $700**
2. That's right, now you only have one car. But that's OK – your days of driving to work are DONE. 1.5 miles? That's ridiculous! You can walk it, or if you're in a rush, bike it. No exceptions here. Hey, what do you know, *neither of you* will be driving to work anymore. Let's set your gas budget to $50/month just so you have some fuel for random errand running. **Additional Savings: $200**
3. No More Childcare! This is the part you already knew about. That $1500 goes straight into your pocket. **Additional Savings: $1500**
4. Refinance that mortgage! Damn, brother, what are you doing still paying 5% in this day and age? Don't you know that three is the new five? You should easily be able to get close to 3.5% with no out-of-pocket costs. Also, if you shop around for homeowners insurance, and get the highest deductible your mortgage company allows, you might save at least $250/year based on the moderate cost of your house. Additional Savings from mortgage interest reduction and insurance: **$250**
5. Drop your cable TV, and get a per-minute cell phone plan, or at least share a family plan. No MMM reader is allowed to pay for cable TV. Life's too short to spend it absorbing passive and ad-laden entertainment every day. Shop around for internet access if your bill is over $50/month. You may use Netflix, Hulu, or the Amazon pay-per-

view movie service. You can probably cut $75 off of your current bills in this area in total. **Savings: $75**

Total Savings so far: **$2725 per month**

So, mostly because of her insane cost of commuting, plus the child care, your wife was effectively working incredibly long hours, missing her little boys, and risking death every day, for approximately zero dollars per month.

By cutting that out, and making the other changes relating to your home ownership costs, she can quit immediately with virtually no effect on your family's cashflow.

Even if some of my suggestions above don't fly, you can surely find others that are just as valuable. For example, your lower household income might qualify you for more tax deductions after she quits, effectively increasing your own paycheck since some benefits are scaled back as household income increases.

You can comb over your groceries and consider some changes or Costco runs. Look into that $300/month mystery fund. Will it drop now that your wife does not need work clothes or lunches out with coworkers? Your car insurance might drop drastically if you get the same discount as I do from Geico for having low annual mileage and no commutes.

You'll still be pretty close to the edge financially, but there is room for more improvement over time. During naps or school days, the lady might feel like flexing her marketing muscles in a freelance way from home, bringing in extra income. Your salary might rise as you continue your career in education, or you might be able to build up a side hustle of your own. And depending on your area, you might be able to find a less costly house that still meets your needs. An $80k salary is enough for a great family life in the US and Canada, as long as your housing cost doesn't eat up too much of it (I'd suggest going for $1500/month or less if possible given your income and family size).

And remember that kids don't stay young forever. Even if you sacrifice a higher savings rate right now by spending time with them, there will be plenty of time later to crank things up and get Mustachian to get the savings you need for early retirement, helping them with their educations, etc. Once they're firmly established in grade school, you'll get your days back, allowing more working time without the need to pay for child care.

In the long run, you'll do fine – as long as you get out of the consumer borrowing habit and start doing the math before making decisions about where to live and work in the future. Good luck!

Get Rich With: Nature

By Mr. Money Mustache

Fri, 06 Apr 2012 12:00:06 +0000

Little MMM, enjoying the ultimate toy

I've got yet another secret to share with you today, that could further destroy our economic system if it got out beyond the confines of this blog.

You know the office building or house you're sitting in right now? With all the accessories and products and painted walls and carpeted floors? And the rooms you have with extra stuff, like toys for yourself and other toys for your kids, and the garage filled with other things?

All of those things you've bought are pretty awesome. I'm not going to deny it, because I have an equal number of cool things myself. When you put all of our things together, they surely cost quite a pretty penny. And they're worth it.

But the secret is, there is *even more awesome stuff* outside your house, and *even more of it* way over yonder beyond the edge of your town. This additional stuff is so amazing, that even the smallest speck of it is even more complicated and sophisticated than an iPad 3. But the weird part is, all of the even more awesome stuff is *free*.

It gets even weirder: we Humans, rather than just living in a network of large cities connected by airports, actually live on an enormous ball of rock and water, three billion trillion tons of it, racing laps around the Sun at 67,000 miles an hour. The ball is really a giant spaceship, carrying its own life support systems and collecting energy from the Sun, and it actually *made* every living thing on itself – including you. That's right, the earth *made you*, even more than your mother made you, because it made her first. It made all of us – from scratch.

So it's pretty effing amazing. The entire surface of this Earth thingy, 130 billion acres of it, is teeming with really interesting creatures, sights, sounds, and smells. In the many areas not yet paved over by Humans, you can find steamy jungles filled with cackling birds and breathtaking fjords with waterfalls gushing down their sides in slow-motion. Or even just a big shady oak tree in your own back yard with a trunk too big to reach around, muscular roots reaching deep down beneath the surface, and a million little green photosynthesis factories rustling around in the spring breeze above you, as you lie with the back of your head in the soil, looking straight up into the canopy and into the blue sky beyond. Into SPACE.

It's easy to forget about Nature when you lead a modern life. And when you forget about it, you slip into a pattern of spending your whole life trying to figure out what's missing. Driving around, buying things, watching sports on TV, going out to entertainment establishments. Those things are all fun, just like our stuff. But most of the needs they fill are just replacing things that we were already getting for free, from Nature, for thousands of generations before they were invented.

Luckily, each generation is born anew, with a fresh instinctive appreciation of Nature pre-wired right into its little baby brain. As soon as a very young child is exposed to the natural world, she'll immediately start harvesting twigs, piling up leaves, climbing trees, and digging in the mud and sand. It doesn't matter how plasticized and commercialized her parents might be. Given the chance, kids will find more fun in Nature than they could ever find with manufactured toys and TV shows.

I like to think of that as a little joke the Earth is playing on us, because as much as we might raid her resources and ignore her, she is saying "Oh No, you AIN'T gonna ignore ME. … I MADE you, Sukka!". You can train a generation of humans to live without Nature, but their children will still be born right back where they're supposed to be.

> " This observation of children is touching and meaningful", I can hear you saying, "but what does it have to do with me? I'm an Adult, and I'm working on getting rich at the moment. No time for sand castles."

But that's just the thing! You DO have time for sand castles. You've got time for any natural adventure that you care to set your mind to, and almost any natural option you choose will make you richer in every way possible.

Learning to appreciate Nature is one of the most Mustachian skills you can build. Nature is a hub that pulls in the good aspects from every corner of life and combines them for you automatically. You get healthier, because the fresh air and great physical effort that are part of being outside are exactly what your body has been craving. This leads to a draining away of your stress and worry. You are challenged more often, because Nature is full of puzzles. The weather is not constant, the light changes, the ground is not flat, and there is water and air spraying in every direction at various times. Challenge, far from being something to avoid, is also one of the biggest sources of happiness. All of this makes you stronger and more productive and feeds back into the start of the cycle as you step outside at the start of the next day.

You gain a deeper appreciation and understanding life itself, as you realize that every living thing on the Earth is actually very closely related. And even just watching and soaking up the shapes and patterns and texture of Nature is calming in a way that indoor activities cannot compete with.

The Human Race survived and evolved by studying and mastering its own natural environment. Because this was such a successful strategy, we evolved a love of nature right into our DNA, to ensure that the curiosity would be passed on to each new generation. So when you're spending time outside, you're pressing your own evolutionary happiness buttons by doing what you were designed to do.

To put it into more motherly terms, The Earth made you to learn from her. And we're always happiest when we are doing what we were *made to do*.

There are obvious monetary benefits to doing things the natural way as well. Walking and biking are far more natural activities than car-driving. And they also come with enormous financial and health benefits. Nature-based leisure activities often come with a very low price tag, especially when done close to home. When you're planning your own free time, you should *start* with the natural activities, like just walking somewhere, having lunch in the park, reading a book down by the creek, and biking around town to get things done. Only after these basic, satisfying things are accomplished, do you even *need* to think about doing anything else with your time. There's already so much to be done out there!

And get this: the areas with the largest amount of Nature available, are often the areas with the lowest cost of living! Big cities are great for young people still getting ahead in fancy careers. And even the biggest ones still offer public parks, trees, and occasional rivers. But as you move out to a smaller city (like the one I live in), the greenery grows even as the property prices shrink. And yet a convenient, bikeable lifestyle remains.

At the extreme end of the spectrum, some of us live in self-sustaining homes overlooking thousands of acres of remote foothills and forests. Land out there can be purchased for the spare change in your wallet, and yet it serves up more Nature every day before breakfast than most city dwellers get to see in a decade. The choices are vast and it's up to you – Nature is not expensive.

Your lesson, then, is to keep a little picture of Nature on your fridge, to remind you to <u>look to her first</u> whenever you have needs. As your skill grows, you'll find that she offers the answer to more and more of your questions. You'll suddenly find that you have less need for money than ever before, and yet more resources than ever. In short, you will be Rich.

What if Everyone Became Frugal?

By Mr. Money Mustache

Mon, 09 Apr 2012 12:00:34 +0000

In the ongoing debate over early retirement, frugality, investing, and simple living, one point is often brought up by our detractors. It usually goes something like this:

> Well, maybe spending less and investing more works for you, but if everybody did it, society would collapse! Our economy is driven by consumers – without them, we are nothing!

And from our own side of the wealth divide, I often get half-joking notes like this:

> Don’t get too popular, MMM. I need those millions of consumer drones out there to continue mindlessly consuming so my stock investments in America’s largest companies can continue to pay me reliable dividends.

I can see the point that both sides are making, and on a superficial and short-term level, they are right.

But in the long run, I believe the picture is much brighter: society as a whole will be much better off once we manage to convert them all to a huge army of Badass Mustachians. And here is why:

Newspaper reporters often repeat the phrase that *consumers are the engine of economic growth* in the United States. They say it so often that most people believe it, as witnessed by the quotes above. But when you read books written by economists (who in general know more about economics than newspaper reporters), they tell you that consumers are not the *engine* of economic growth. They are actually the *caboose*.

What is the engine of growth, then? It is the savers and investors. Only by sacrificing current consumption, can people put money into banks or share offerings, which end up in the hands of new and existing businesses who can then use that money to create new technology, factories, or human capital, allowing them to increase their productivity. Capital creates productivity, and productivity is the driver of our standard of living.

To express the same ideas on a smaller scale: Imagine an ancient fisherman who catches five fish per day with a spear. If he eats all the fish each day, he is saving and investing none. But if he can survive on four, and use the body of the fifth one to invent a fishing hook (or trade it with someone else in exchange for a net), he has invested in capital instead of current consumption – this builds his future productivity.

As it works for the fisherman, so it works for the whole country: investment is good for building a nation's productivity. A shortage of national investment (collectively called the "national savings rate") can lead to a complicated spiral of international trade conditions much like the ones we are seeing now: a current account deficit, a trade deficit, and eventually a gigantic depreciation of the value of a country's currency, and some say hyperinflation as well.

The details of that are interesting (I'm currently reading a hyperbolic book on the subject called "Crash Proof 2.0 " by a grumpy news commentator named Peter Schiff). But they're not necessary for our discussion here. Suffice it to say that "Saving and investment are GOOD for a country, not bad".

This brings up the next question: "But if we're so productive, and yet we're not buying very much stuff, what will we do with all the stuff we make?"

It turns out that's a great problem to have. Through the natural action of free markets, we'd end up doing a mixture of two things:
a) Exporting way more stuff and importing less
b) Choosing to work less and having shorter working hours.

To understand why that would happen, you just have to look at the actions of individuals again. If you're working alone on an island, you only need to produce whatever you want to consume. If an entire society gradually decides that it wants to consume less, then it needs to produce less as well.

If there is less stuff that needs to be produced, then people don't have to work as many hours to create it. That's perfect, because many people will be dropping out of the workforce much earlier as they finish earning the money they need to get going on their early retirement. The shortage of available work will be balanced by the reduced number of people willing to do that work.

The last issue is, "but how will they pay for their early retirement, when all stock investments have collapsed due to the shrinking economy?"

I believe that's just a misunderstanding of the effects of market forces. When a society decides it needs to earn less money, it can happen in a mixture of two ways:
1) people can work shorter work weeks, but similar career lengths
2) people can continue to work long work weeks, but save and invest the extra income for earlier retirement

Either way, there will always be young people looking to get ahead quickly and companies looking for cash to finance productivity improvements – these people will still need loans to start and fund companies. Similarly, there will always be mobile people in need of housing – and so real estate (just another form of capital) will continue to provide returns in the form of rent payments. Capital will always have some value, and thus the concept of investment will remain valid.

So, frugality as a whole would work very well for society. We'd produce less, and we'd earn less, but that is perfect since we would consume less as well.

With the basic economics out of the way, now we can get really idealistic. This growing group of newly-frugal people probably wouldn't just sit around and gaze into the oak trees all day. A certain portion of them would actually be even more motivated to produce new things than they were when under forced employment.

So, they'd start working again. But without much demand for consumer products, society would probably value different things. Some people would be willing to spend more to buy all-renewable energy. This would create market opportunities to build more of the stuff. And it turns out that there are many trillions of dollars of work to be done in that area. Other people might be willing to spend on better health developments, building up developing countries, or improved educational opportunities.

If you check in on what Bill and Melinda Gates are up to these days, you'll see a perfect example in large scale: people who no longer need to work for money, keep on working with the goal of helping the world instead. I want *you* to do the same thing once we're finished getting rich together here.

All of these new desires would create more market demand, pulling workers into new fields and causing further growth of humankind's capital. The free market would do its usual job of allocating resources efficiently, and it would feel much like it does today.

So you see, there is really no magic to the fact that we are currently buying and throwing away a lot of junk. Far from being a boon to our society, it's really an enormous tax we place on ourselves, because it diverts our energy away from more beneficial efforts like the ones noted above.

In the short term, a massive switch to frugality would cause an economic depression, as the free market struggled to reallocate everything. Many people would suffer. But by creating a small and constant shift to a new way of living, the system will have time to adjust gracefully over time.

Luckily, there are only a few tens of thousands of Mustachians so far. The world isn't in a rush to bend to our ways. But together we'll get this thing fixed, if we just keep the pressure on, slow and steady, until the job is done.

Get Rich With: Good Old-Fashioned Honesty

By Mr. Money Mustache

Wed, 11 Apr 2012 12:00:20 +0000

Just a few minutes ago, I was at the grocery store bagging up a few last-minute purchases for a dinner party we're hosting tonight. I was enjoying a bit of small talk with the young lady running the register, when suddenly she transformed into a zombie and started rapidly muttering some nonsense that had nothing to do with our conversation:

> Okay Mr. Mustache, you saved $3.12 today which is 15%, your fuel bonus is up to 120 points, and you are eligible to participate in a store survey at the URL provided on your receipt. Would you like any help out today sir?

I wasn't overly surprised, because she had briefly run the same zombie script a minute earlier when the customer ahead of me was checking out. But I felt sympathy for her: here was an otherwise-intelligent college student being forced to recite a series of selling points that were dreamed up by a team of lame-brained marketing executives somewhere far off in Safeway headquarters. I knew her plight, because I was often scolded in my own minimum-wage jobs for *not* delivering the prescribed annoying marketing speeches when I thought the boss wasn't watching.

The executives surely had their on-staff statistical analysts run some numbers, which indicated that customer conversions from grocery to fuel sales increased by 3.12% in the 90-day period after adding the fuel points reminder, and that Safeway discount card usage increased 5.55% due to the reminders about the fake savings. These executives surely congratulated themselves – “We’re making a killing just by forcing our young, powerless employees to recite our targeted messages a few hundred times each day!” Just as factory farms make a killing by pumping antibiotics, hormones, steroids, antidepressants, and even ibuprofen into their caged animals to increase growth speed while decreasing handling costs, and just as tobacco companies have made killings in the past by actively distorting evidence that their products are in fact killers.

Companies who run their business like that are indeed making a killing. In the short term, they’re generating killer profits. In the long run, they’re killing the goodwill of their customers, employees, and society as a whole. Because while they think they’ve thought of everything by running the numbers, they have actually forgotten to capitalize on the biggest advantage of all.

This advantage is often overlooked, because it is almost impossible to measure, but it’s still there. The name of this incredible long-term strategic tactic? **Good Old-Fashioned Honesty.**

The neat thing about honesty is that it can be adopted by large companies and individuals alike. In fact, it’s much easier to adopt it yourself, because in large groups the political jockeying often allows less honest characters to rise into power, where they are able to force a “shortcuts-only” methodology on the rest of the group.

To the untrained person, the benefits of honesty can be counter-intuitive and hard to grasp. On the surface, almost every business and personal decision can be optimized by being a little bit sneaky. The Safeway executives are certainly happy to increase gasoline sales. The plumber can definitely make a few extra dollars by exaggerating the number of hours worked on his customers’ projects. The tourist-trap operators have a good cackle when they count their profits from $78.00-per-adult admission prices and selling people overpriced photographs of themselves on the roller coaster.

Even I have been encouraged to be sneaky, by some of the companies that provide referral fees for this blog. "If you just write an article promoting this new credit card or that product, you'll surely see your commission numbers go through the roof! No, it doesn't matter if you actually use the product yourself – just write the articles and you will see!"

But there's another way to do it, which is to turn down all the short cuts and try honesty instead. The bizarre thing about honesty, is that it *actually makes you much richer than sneakiness, even while making you feel better about your work!*

When the plumber or the tourist trap operator or the online writer turns down opportunities to sell out, they sacrifice some short-term profits, but they get something much more valuable (although not measurable) in exchange. The good will of their customers. At first, this good will is invisible. That's the difficult period that loses most potential honest people. Then it might turn up in the form of a compliment or a smile occasionally. Gradually, it will manifest itself as repeat business from customers and referrals, or job promotions, and companies competing to hire you for increasingly desirable positions.

But after many decades of relentless honesty, the result will be nothing short of a small cult following. You'll have an army of friends and colleagues who would trust you with their life, or their life savings. You'll have the respect of your family. Most importantly, you'll have the respect of yourself, which will be there for you whenever the external world takes one of its inevitable dumps upon your head. When you eventually expire, the story of your honest life will be your most valued legacy, as one MMM reader shared in Eulogy to a Great Dad.

Being honest with yourself can boost your productivity as well. The dishonest person is always in self-denial, blaming the world for his or her problems. "I can't save more money and become financially independent, or physically fit, or happy, because the world has inflicted me with this or that problem, or it has forced me to live in this area far from my job, or it just has a grudge on me."

There's no doubt that not everyone is born with or given the same advantages. But there's also no doubt that many people, with fewer advantages than you, have overcome them to achieve much greater things than you. So to be honest with yourself, you need to say, "I currently SUCK, compared to these more badass people. Sure, I've done some great things in my life, and I'm proud of them. But I still suck, which means I have an opportunity for improvement".

The day you stop believing that you currently suck compared to your true potential, is the day you start blaming the rest of the world for not reaching it.

An honest company develops a cult following among its customers. They come back far more often, spend more, and spread the word much wider, than they do when they sense they are being duped. These companies tend to last for several generations, remaining highly profitable throughout the years, and close down only when the owners or their descendants decide to retire.

Meanwhile, I now avoid Safeway whenever I can, and mock it on this blog regularly – just because they have always had the big-company dishonesty about them. Besides the constant sales pitches, I'll never forget the time they tricked me into paying $3.99 for a single red pepper by doubling the price overnight. That move may have brought Safeway an extra $2.00 of profit in the short term, but it will cost them many thousands over the long run.

Although his fame has brought him a few critics, one of the most prominent honest people I've ever studied is Warren Buffett. Calmly and through many decades, he has simply told the truth, and avoided sellouts and shortcuts while practicing his natural talent of investing in and managing companies. Despite constant understatements of his own abilities and cautious downplaying of the future performance of his company Berkshire Hathaway, he has consistently blown the doors off of his less honest competition, in both company performance and in respect.

The honesty has created such a snowball of credibility that his words alone can save or destroy companies. A series of relatively small investments he made during the 2008 financial crisis helped to stabilize the entire world economy, simply by lending his credibility to the financial system.

Imagine being so well respected, that even your symbolic gestures can s*ave the whole fuckin' world**. That is the utmost expression of the power of Compounded Honesty.

Although the examples above can be intimidating, getting started in riches through honesty is easy. You just have to stop caring at all about short term gain, and develop the ability to downplay, rather than exaggerate your own abilities.

> "Although I'd enjoy building this $25,000 kitchen for you, Mrs. Smith, I'd still suggest you consider some other options as well. You might get just as much functionality by just adding an island to your existing kitchen. And be sure to get quotes from other contractors as well – I've bid this one a bit high, since some of the work is new to me and will take me longer. Other carpenters may be able to beat my price if they are more experienced in this area".

> "I'm sorry about the bug in the latest software release – that was totally my fault because I failed to catch it when designing my test cases. I've now got it fixed – and a big part of that came from the help that Rakesh provided me late on Thursday night.

Once you adopt the policy of honesty, it is hard to go back. The reduction of stress you will experiencing from dropping all pretense and salesmanship will provide an immediate boost in your effectiveness. And far from being expensive, it's actually one of the the most profitable habits you can develop.

** My use of the F-bomb in this sentence represents my best effort at being honest as well. I was initially tempted to censor it, thinking, "Hmm.. Honesty is also a common religious value, and who knows, this article might get forwarded widely among churchgoers if the Internet decides it shall be so. But swearing would very much decrease its popularity among* *that group. Should I use a different word? No. Fuck it. The sentence sounds better with the wonderful expletive so I must be true to the Mustachians.*

Early Retirement: It's Not as Risky as you Think

By Mr. Money Mustache

Thu, 12 Apr 2012 21:49:41 +0000

MMM vs. Financial Samurai!

Breaking News!

Mr. Money Mustache has just made another one of those online Road Trips – this time to the home of the Financial Samurai.

I wrote a guest posting there, in response to a little battle that had been brewing between the Samurai and myself. The goal was to set the record straight about how the Mustache family survived the 2008-2009 Great Financial Crash, without having our retirement savings destroyed.

Critical to my point was the fact that while US stock prices dropped about 52% during that period, the dividend payments made by those same companies only dropped by 21% – and then rapidly recovered. Similarly, while house prices were cut by 10-30% in my own city, rental rates actually increased. In other words, early retirees don't need to worry about stock market crashes, unless they are stock speculators.

Here's the post, as I originally wrote it to appear on his site:

Early Retirement: It's Not as Risky as You Think

Like you, I've been inspired by the teachings of the Financial Samurai for some time now. I enjoy his constantly bullish take on life, his flame-breathing enthusiasm for hard work, and his interesting tales involving large sums of money and rental houses.

But there's one place we seem to disagree, and that is in the area of Early Retirement. For those that don't know me, I'm a big proponent of that lifestyle, and I write about it frequently on my own blog. My wife and I quit our own cushy corporate jobs over six years ago in order to raise our little kid, and we haven't looked back since then.

The Samurai, on the other hand, occasionally likes to poke fun at the idea of early retirement. I've collected a few quotes from him on the matter.

Let's be honest, writing about retiring in your 20's and 30's is a gimmick. Apparently, there are people in this world who actually work 40 hours a week or less and complain why they can't get ahead!

I love to work and the ideal amount is 2 to 4 hours. I think if everybody were able to work less hours a day, they'd probably love their jobs that much more and last that much longer too.

On top of that, I've seen the Samurai speculate that several million dollars in net worth would be required to retire, and I've read case studies on this site suggesting that people might not want to walk away from their $250k jobs, even after they've been working them for 16 years.
"That's cool", I always say, "to each his own". The MMM family is still happy with our own early retirement and the party goes on.

But recently there have been some challenges thrown down between our two camps. Financial Samurai has been popping up around the web, saying things like "The best thing about Mr. Money Mustache is how he was able to show investment gains even during the 2008 meltdown! He should be a hedge fund manager!".

I know a friendly ribbing when I see it, and I think the Samurai is really challenging me to answer this question: "How can you retire at age 30, with a family, on less than a million bucks, and still live a good life and even survive gigantic financial turmoil like we've seen?".

So here's the answer: Very Easily! To illustrate, allow me to tell you this little story:

I didn't know much about retirement when I set out to become financially independent. I was only 21 years old when I got started, and I hadn't yet learned about retirement planning, savings rates, or even the basics of stock investing. The only things I understood were how to earn more money (working hard at my job), and how to spend less than I earned (buying less stuff than my friends did).

As time went on, I learned more things. I read about a hundred books on economics, finance, and investing over the years. I learned how to renovate my own house and take care of my own cars. I even read about health and fitness, nutrition and cooking. I got married and my wife learned a bunch of skills too. In addition to her main job in software project management, she got her real estate license and became a badass web developer. We moved to the US together and learned about the new culture in this great and business-friendly country. Most importantly, we had plenty of fun and met lots of people in our new hometown – people with many additional skills that were happy to share them.

As the years passed, the habit of stashing away cash and the new skills started to mix in interesting ways. I was able to move from my first house, which I had renovated from a 1978 junkpile into something trendy and modern, and rent it out at a profit. This paid our mortgage on a second house, which I also renovated. The hobbies of fitness and biking paid off in the form of being able to share one older car instead of two newer ones, saving thousands per year. These savings could then be profitably invested in stocks due to the better investment knowledge. Weird synergies like these continued.

Eventually, we realized we had built up enough passive income from stock dividends and rental houses to sustain our low-cost lifestyle, so we quit our office jobs and had a baby.

But just like the Financial Samurai, we both still love to get things done occasionally. We took up part-time jobs doing things we enjoyed, from home. She would occasionally help a friend buy a house and earn a real estate commission, and I would occasionally do some carpentry in my garage or around the neighborhood. At other times, when family duties or long vacations called, we would not work.

Things didn't always go smoothly. The Great Financial crisis hit in 2008, and caused the worst recession since the Great Depression. The value of my retirement savings in stocks was sliced in half. I was also stuck with an extra house I couldn't sell. We had been blindsided by something we never could have predicted a few years earlier.

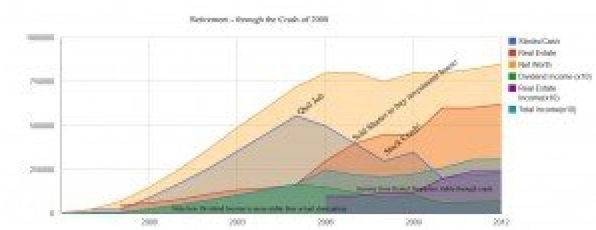
Were our early retirement dreams shattered?

Amazingly enough, they barely took a hit! Most US companies continued to make their dividend payments at a barely-reduced level throughout 2008 and 2009. The rental market remained strong enough to keep properties from sitting vacant. Sure, the stock prices were down, but who cares about stock prices when you're not selling them?

We dialed back our spending for a year or two, continued to rent out the un-sellable house, and I even made a point of doing some extra work so I could afford to buy some of the stocks that had been beaten down to bargain levels.

Eventually, the economy recovered. Stocks rebounded, my rental income went up and I started working less again. Meanwhile, my little boy has made it to six years old now, and hanging out and learning with him continues to be my biggest job by far, just as it has been since he was born.

What does all this look like on a graph? I put my best estimate of the numbers into the chart below for your review:



This chart is based on the numbers from an old article on my own blog called "a brief history of the 'Stash" . The key thing to note is that while stock prices and real estate values fluctuate wildly, dividend and rental income barely changes with a recession.

That's a long story, but it's supposed to be a lesson too. I am trying to show my more fearful friends that Early Retirement is not a risky or scary proposition. It's pretty much just the same as a regular working life, except you have much more flexibility. This flexibility lets you adapt to any changes that might happen – financial, health, or otherwise – and continue to lead a good and happy life. The more flexible you are, the greater your chance of being happy, wherever your life takes you.

A big part of this flexibility comes from having a bunch of complimentary skills. Imagine a workaholic double-career family who are so busy earning (and spending) $300k per year that they don't even have time to clean their own house or cook their own dinner. These people feel "security" from their high-income jobs, but they are also locked into two expensive cars that they depend on even to get to the grocery store 2 miles away, a gigantic mortgage, $900 per month in extracurricular activities for their kids on top of the $3,000 in childcare or private school tuition expenses, and the list goes on…

This family is secure only as long as they both maintain their high-income jobs. Even a few months of job loss would leave them deep underwater with no hope of rescue. If an industry evolves and their skills become obsolete, they could be stuck forever, with bills they can never pay. If their roof leaks or the car breaks or the lawn needs mowing, these people don't have the skills to solve their own problems without spending a ton of money. So they will always be dependent on earning ton after ton of money.

Let's contrast that to the early retirees. With the mortgage paid off and no debt of any sort, these people have very minimal monthly bills (mine are only about $2,000 per month, and that includes raising a young child and living in a rather large house). They have savings equal to at least 25 years of living expenses, which are invested to provide enough cashflow for the expenses, with plenty held back to keep up with inflation. They have the ability to cut their spending much further if hard times ever hit. Plus they have skills and personal connections that would allow them to earn income if it were ever needed. On top of that, they actually do earn occasional income, and save 100% of it, further growing the nest egg.

When you really think about the two lifestyles, does it really seem that early retirement is risky at all? I feel safer now than I ever have in my life. And the freedom is useful in motivating me to try things that I wouldn't otherwise have time to do – like starting some low-key businesses in areas that interest me, and of course, a blog about early retirement!

So for those pondering early retirement, I'd like to offer some advice: if you do the hard work required to save for it, chances are you'll automatically develop the skills to thrive once you are there. You don't have to worry about what it will be like – just start the journey and let your life skills grow even as your cash does.

I hope I have helped to slice through another one of life's financial mysteries!

love,

Mr. Money Mustache

Guest Posting: Annuities – a Solution for the Cautious Retiree?

By Mr. Money Mustache

Sat, 14 Apr 2012 20:09:42 +0000

The Following is a guest article submitted by a long-time Mustachian named Gerard. In the past, he has worked in the annuities department of a financial firm, but now he's a university professor on Canada's East coast in a completely different field. Many thanks for the free lesson, Gerard!

Get possibly slightly less poor with… Annuities

Mustachians often deal with our nemesis, Complainy Pants, but less with CP's sibling Scaredy Pants. CP says "I can't," while SP asks, "What if?" Many of us probably have more sympathy for SP, as our courage and optimism is tempered by some caution. We are planners, after all.

Today I'd like to borrow a little room to talk about two SP what-ifs that might be more relevant to MMM readers than to other people:

“What if the so-called Safe Withdrawal Rate doesn’t hold up for me?” After all, the classic safe-withdrawal models are based on making your money last for thirty years, and many of us are looking at far longer “retirement” spans than that. The longer the span, the greater the odds of a really bad spell that leaves us in a pinch. In our earlier years, we’ll have greater opportunities to make up the difference with extra work or mobility, but that option declines as we do.

“What if I live for a very very very long time?” Same concern, really: a longer retirement span than people usually plan for. There are an awful lot of long-lived cyclists and dancers and nature-lovers and gardeners and healthy eaters and optimists out there. People like us. Again, we need our money to last and last… or we might, at any rate.

The simple answer to this two-headed question, of course, is to save a whole lot more money and aim for a lower withdrawal rate. This is the money equivalent of over-engineering, when you reinforce buildings for the strongest possible winds, or build levees for the highest possible hurricane waves.

The problem with this simple answer is that it isn’t easy, and perhaps not even sensible. It puts us back in the “I need millions to retire” category, and financial independence then moves farther out of reach of many lower- and middle-income people.

Another solution would be to spread the risk. It’s foolish for every one of us to save far more than we’ll likely need, just in case we live to be 110. One or two of us might, but all of us won’t. What if we pooled our savings? We could then each take a higher percent of our money out of the pool every month. Over time, some of us would die, thus reducing the amount withdrawn. Eventually there’d be only a couple of us left, but there’d be enough money left too. We’d all die broke, but we’d never live broke.

Ideally, we’d figure out our safe withdrawal rate by having our combined likely lifespan calculated by somebody with experience at that. An insurance company, maybe. These actuarial calculations let defined benefit pension plans make reasonable payouts despite smallish contributions. What we need is the equivalent for private citizens.

Of course, such products already exist, and they're called annuities. You give insurers a pile of cash; they invest it; every month, they pay you much of the earnings and some principal. They hope you die soon; you hope you don't. Basically, it's life insurance in reverse (in fact, insurance companies sell annuities to offset some of the risks of life insurance). Because their risk is spread across many recipients, and because they're basically giving you back your own money, annuity issuers can afford to give you more per month. Right now, a 65-year-old Canadian male would get about 7% returns…. taxed at a very low rate, as some of the money is yours anyway. This is not great, but it's much better than current returns from other super-guaranteed sources of passive income. If you plan well, you buy annuities during times of higher interest rates, and get high rates of return locked in for the rest of your life.

For 70-year-olds, it's about 8%, for 75-year-olds, it's about 9.5%. Historically, I don't know, but the Telegraph says rates are at a 20-year low: http://www.telegraph.co.uk/finance/personalfinance/pensions/7827237/Pensioners-hit-as-annuity-rates-tumble-to-20-year-low.html

…and that returns would have been about 15% in the 1990s.

So, should everybody reading this jump into annuities? Probably not. In fact, some people probably aren't even reading this paragraph, because they've jumped to the end to comment on how bad these things are. For the rest of you, let's look at some problems:

1. Annuities are often sold by high-pressure sleazebags. Well, yes. Just like whole life insurance. In fact, it's the same sleazebags! But that doesn't mean that nobody needs insurance. Shop carefully. Research your potential providers. Different jurisdictions have different legal requirements for issuers. Remember, you're talking about handing over a huge whack of your money.

2. The house always wins. In other words, the issuer is very good at calculating your likely life expectancy, then scraping off a generous profit and paying you the rest. This is presumably true… unless you win and live for a very long time, which you might remember is the problem that brought us here in the first place. Issuers may ask you about pre-existing

health conditions and smoking history before giving you a quote, but they don't know that you've spent decades cycling 150 miles a week and playing with your family and breathing clean air and avoiding workplace stress. This is your one chance to really stick it to an insurance company without dying or cheating.

3. I'm not 65. This is a major issue. Annuities, after all, are designed as income for the great majority of people who retire late. It's hard to get an annuity to pay out if you're younger than about 55, and your return will suck. As it should – even extremely unhealthy people are likely to live well past that age, and the issuer can't be doling out big gobs of your principal for that many years. Young retirees should almost certainly avoid annuities. But once you hit an age where you don't really want to head back to work if things go wrong, annuities start to make more sense.

4. I'm very smart. Mustachians are by nature researchers. Many of us know a lot about how to get reasonable returns on our capital. And we're rational and contrarian enough to be willing to buy when stuff is cheap and people are scared. That high-dividend stock or rental-worthy house we bought when we were thirty is going to be paying crazy returns after 40 years or so. Probably. On the other hand, we may hit the point where we don't want to be dealing with tenants, or we can't manage our own affairs all that well, and we need something that's completely idiot-proof. Especially when we're 110. The very old clueless know-it-all landlord is a menace to society and often to himself.

So really, most MMM readers shouldn't be rushing out to buy one of these things tomorrow. But there will come a time when that might change. (Funnily enough, planning for later life seems to be a blind spot for many in the Financial Independence / Retire Early community. Many of us are too young to want to think about those years, and once we've re-imagined retirement as an active, agentive thing, it's hard to remember that we'll also need to account for the Depends years.)

With a little extra work or frugality to cover a lean year or two, your little green employees should get you through the first long stage of your retired life. But then they might need to ease back a little, too. That's when annuities start to make sense.

* Reference materials: these numbers were pulled from Canadian-based annuity quote-finding websites like http://www.lifeannuities.com/articles/2012/annuity-rates-canada-2012.html, but the same principles apply in most other countries as well.

Unlock your Inner Mr. T – by Mastering Metal

By Mr. Money Mustache

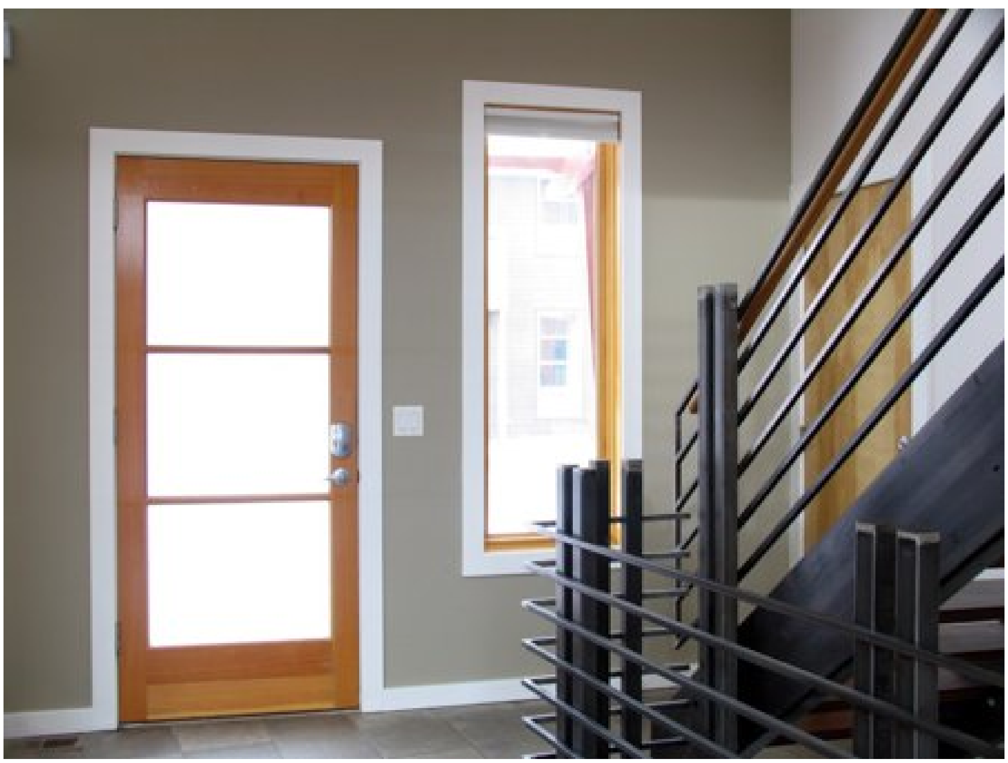
Mon, 16 Apr 2012 11:41:51 +0000

As a kid, I occasionally had the pleasure of catching episodes of The A-Team when I was allowed to stay up late. The show had plenty of action and comedy, at a level ideal for a ten-year-old boy. But my favorite part was always the inevitable scene where the team would harvest a bunch of scrap metal parts or an old van, and start cutting, grinding and welding them together into a new contraption. Cut in the form of a montage with the A-team theme song playing in the background, Mr. T and his teammates would send showers of sparks and precise beams of flame shooting around their workshop as they brilliantly created some new weapon or vehicle that was critical to succeeding in their mission.

Since then, I've always wanted to gain the magical Power over Metal that the A-team had. But even as my woodworking experience grew, my metalworking skills did not advance beyond using a hacksaw to cut the odd long bolt down to size. Metal was a forbidden material – unknown, too hard to cut and too fussy to join together to allow for practical use.

That all changed in the year 2005, when I was building my first custom house. It was a modernist design in a new urban neighborhood, and the architect I had hired took advantage of that freedom to plan some really cool details into the place. Exposed steel railings, bolts, and brackets were to be blended in next to loads of wood and natural stone, highlighting the airy and sun-filled living spaces. It all sounded great, until I sent the design over to a Boulder-based metalworking contractor, and he sent me back a quote for $15800.00, about four times my budget of $4000 for that part of the project.

“Damn!”, I said, “If this guy is billing out his metalworking time at $75.00 an hour, that’s a sign that I need to finally learn the craft myself. How hard can it be?”



Here’s some of that staircase metalwork

So began my saga of metalworking, and in the years since then I have profited immensely from the new skill. Tens of thousands of dollars have been saved and earned, and many interesting things have been invented that I never could have created from wood alone.

After building the steel staircase railing systems at that house, I was immediately recruited to do a similar railing system for someone's rooftop patio. Then I started creating garden accents like steel gates and unusual plant holders. I used the expanded set of ideas to design even more metal architectural details into my second custom house project. Then I went on to more relaxing projects: welding up an enormous steel lumber rack and permanently attaching it to a 1984 Nissan pickup truck, creating structural parts to help straighten up the sagging foundations and floors of historic houses, making signs for Mrs. Money Mustache's real estate sales business, building some of my own workout equipment, and even making a custom shower curtain rod for the new shower in the Foreclosure Project house. Right in the middle of making this article, my garage door opener ripped its attachment bracket in half due to improper installation, and I was able to fix it with.. welding!

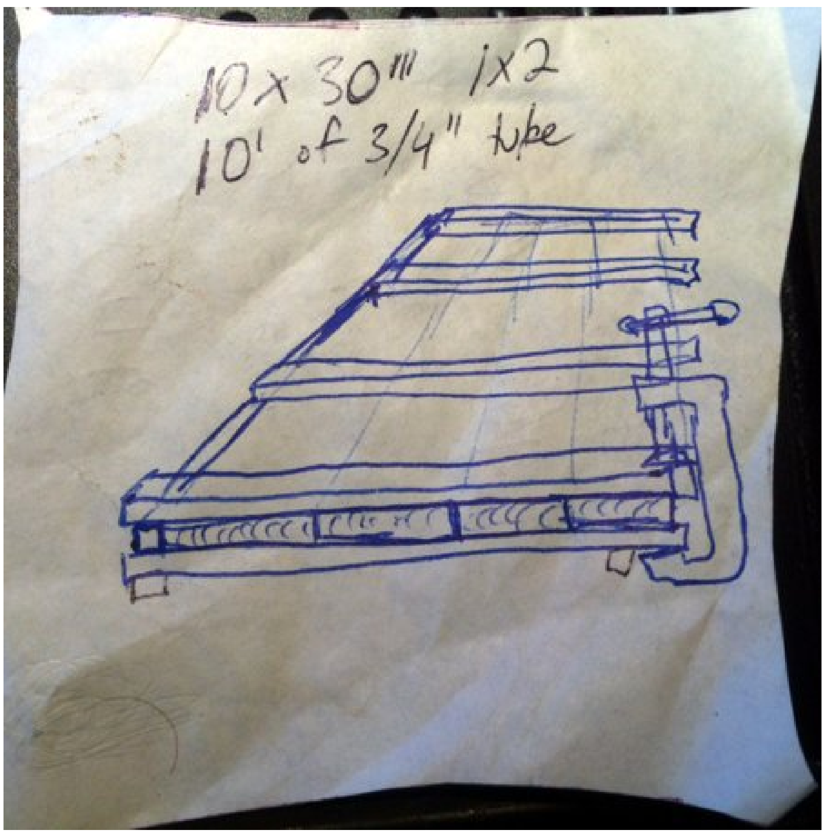
Besides being an enjoyable skill to learn, welding and metalworking gives you an aura of mystery due to the fact that hardly anyone knows how to do it these days. I could barely spark up my welding machine when working in the posh custom home neighborhood without catching the attention of passers by who would walk over and say, "You're a WELDER?? Could I have your business card? Because I have a project I'd love you to take a look at." Another one of my work crew with welding skills was recruited away from underneath me, to spend the winter on a Florida Key, crafting an elaborate balcony and patio system for a financial tycoon's new seaside mansion.

Because of this shortage and appeal to high-end clients, I believe that metalworking would make an ideal side-hustle for a person who already enjoys building things. It would also make a great business for a younger person who wants to earn enough between college semesters to get out of school debt-free. Heck, with the right business skills, metalworking is a way of getting a professional-level income without the need for a college degree. Higher hourly rates, sparse competition, and interesting projects all seem to be common among self-employed welders. And with very little training and no licensing required, it's easy to pick up.

So just in case this appeals you, now or sometime in the future, I'm going to plant a Welding Recipe in your head. You can use it today, or you can file it away for later when you quit your day job.

Stuff You Need:

Just as I summarized in an earlier article on getting started in carpentry, the basics of creating cool things from steel are the identical for those in woodworking: Design, measure, cut, attach.

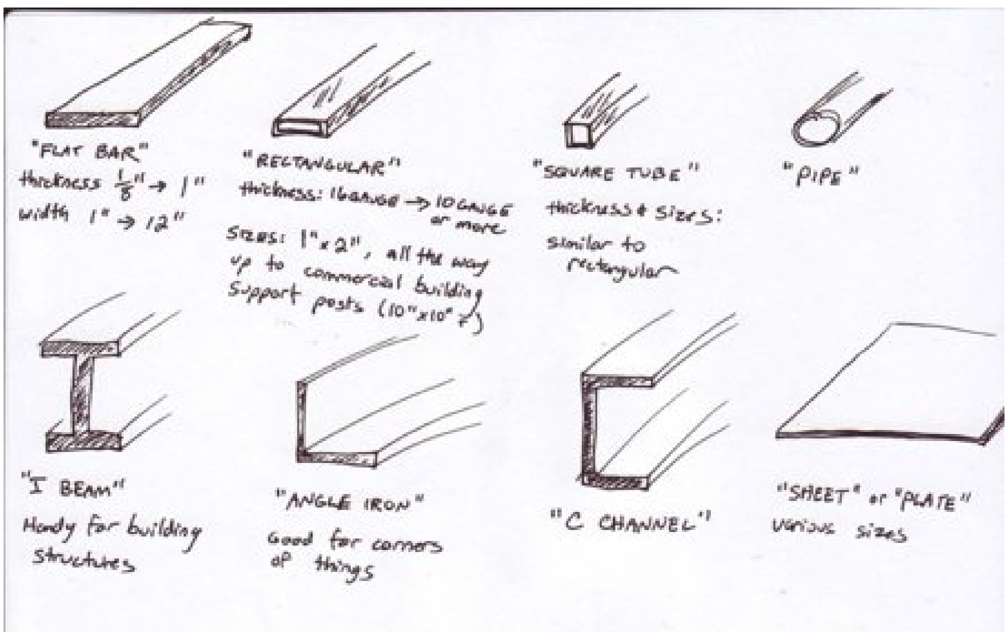


Here's a hasty design sketch I made for a metal table for clamping together long boards to speed the process of gluing them into large sheets for furnituremaking. I ended up building this thing, picture later in this article.

The design stage for steel is slightly different, just because you don't have as much freedom to carve and trim things on a table saw like you do with wood. So you focus on mostly straight stock widths, cross-cut at various angles, and attached together in simple arrangements. With basic metalworking tools, you won't be making yourself a curvaceous supercar. But you CAN certainly make a nice Mad-Max-style dune buggy, go-kart, or even a bike or trailer.

In exchange for the reduced cutting flexibility, you get enormously greater strength: you can zap two 1/8″ thick inch pieces of steel plate together for 15 seconds on the welder, and the resulting joint will already be strong enough to support a small truck.

With steel, you buy long tubes of the material by specifying wall thickness, shape, and size. I drew this sketch for you of the most common types:



Some standard formats of available steel

The crappier the building, the better the source of fresh steel

A few basic metal pieces can be found right in the hardware section of Home Depot and Lowe's. But for serious projects, you'll want to find a metal shop. Look up "welding" in your local business directory, and you'll end up at a friendly old sheetmetal building in the industrial section of town where the guys have grease on their cheeks and awkwardly peck away on a beige 486 running Windows 95 to ring up your order. There you'll probably find the best prices on steel, and will be available in lengths of up to 24 feet. I get my raw materials at "Mountain View Welding", shown at left.

With knowledge of design and materials, the last step is the tools. They're surprisingly simple:

A Grinder:

My grinder has the concrete-cutting blade on it in this picture, metal

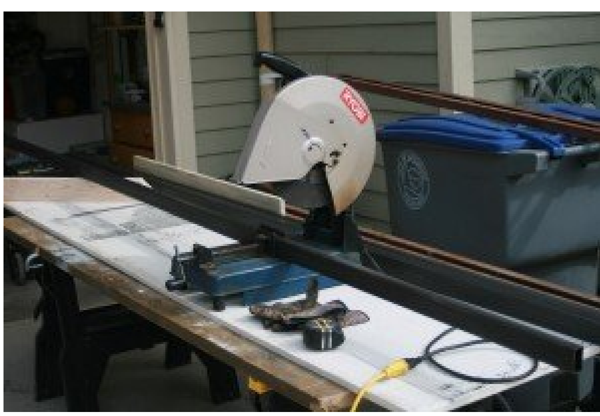
cutting is lower left, sanding wheel is
lower right.

This is the official Mr. T. tool. Its a dead-simple handheld rotary tool that simply spins a 4.5″ disc around extremely fast (about 11,000 RPM). The disc has rough parts that hit the steel at high speed and cause it to break off in dust-sized pieces. Because of the energy involved in each tiny collision, the broken fragments are instantly heated to white-hot temperature, so they appear as a glorious shower of sparks that shoots across your workshop, lighting it up like a KISS show. The sparks aren't as dangerous as they look – they will bounce off a flannel shirt and extinguish themselves before they even hit the floor. But you still don't want to grind steel in the presence of exposed gasoline or other flammable things. Also, don't use your grinder with the blade guard and side handle detached like I do. It's much more dangerous like that.

By fitting different discs to the grinder, you can cut, smooth, and polish steel. You can also throw on a diamond blade and cut through rocks, tile, and concrete as if they were butter. Or a sanding wheel to destroy any thickness of old paint on wood within seconds. So it's a versatile tool. Dangerous too – keep those fingers away from the 11,000 RPM.

Cost: $30 – $75 … Harbor Freight Tools Example, Home Depot Example

A Metal Chop Saw:



Like a single-purpose stationary grinder with a massive 14″ cutting wheel, this low-tech behemoth can make rapid and fairly clean cuts across the pieces of tube steel shown in my diagram above. It clamps the tube in place, and you lower the cutting head down to make the chop. There is an angle setting, allowing you to make corner joints and other useful cuts.

Cost: $100-$200 … HFT Example, HD Example

A Welder:

This is my welder – looking pretty beat up after six years of heavy use, but still fully functional

The king of your metalworking kit is of course the welder. There are many types available, and I agonized over them for quite a while before deciding. But I'll save you the hassle and just tell you the best type for high rewards and low effort: a 120 volt wire-feed flux core welder.

The way this welder works is that a thin wire of special metal alloy is slowly fed through the gun-style handle that you hold in your hand when you squeeze the trigger. Simultaneously, a giant (but very low voltage) electric current is passed through the tip of the metal alloy and forced to jump into the piece of metal you want to weld. The electricity jumps across the gap, creating a spark that is hot enough to melt steel, and then a tiny pool of liquid metal forms at the junction of the two pieces you are joining. It's a mixture of the metal of the two pieces, plus a bit of your alloy, plus some "flux" in the wire which helps keep the reaction smooth.

Cost: $200-$450 … HFT Example , Lowe's Example

Safety Equipment:

Welding with this type of equipment creates a bunch of jumping hot sparks. They burn for longer than the grinder sparks, so you need to do it on a non-flammable surface like a concrete patio or a piece of metal or cement-based tile backerboard set up on sawhorses to form a **convenient work bench**.

You also need a pair of puffy **heatproof welding gloves** to protect your hands from the sparks and ultraviolet light from the welding spark (I actually got a mild sunburn after welding all day once with some exposed skin).

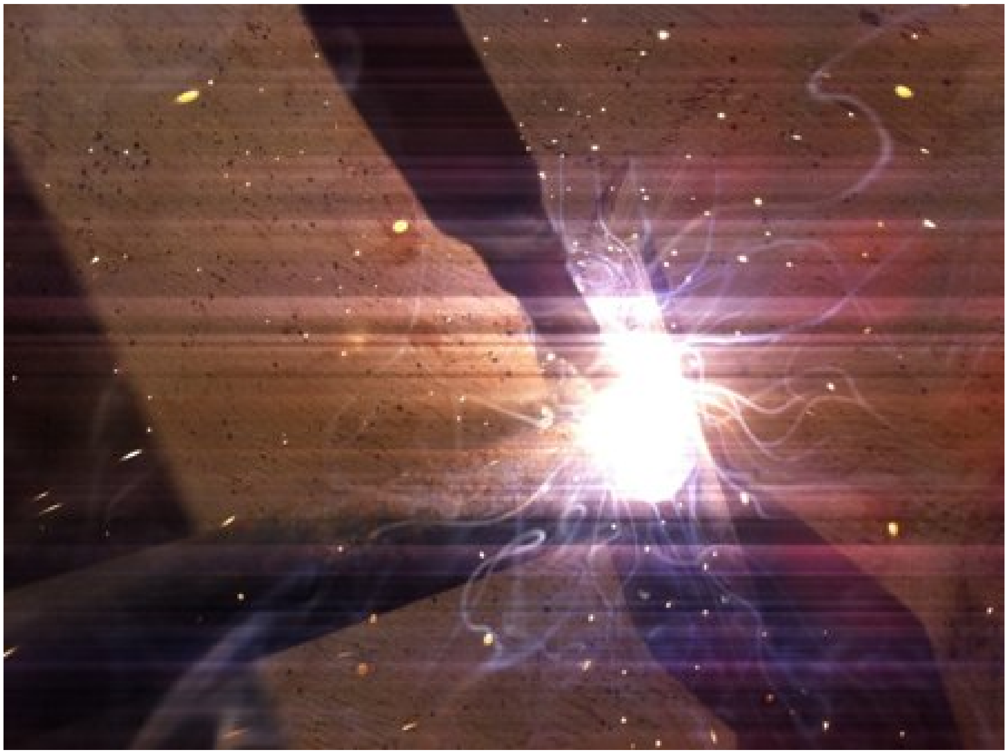
And most importantly a **welding visor**. This is simply a plastic shield that keeps sparks off off your face, which has a lens as dark as about 20 pairs of sunglasses stacked together. The dark lens allows you to look at the welding spark and the molten steel (about as bright as staring directly into the Sun), comfortably, to control your work easily. In the olden days, these visors were permanently dark, meaning you couldn't see your work until you actually started the welding spark. Nowadays, the visors are "auto-darkening", which means the glass is clear until it detects bright light. At that point, a liquid crystal layer in the glass is instantly charged, turning it black so your eyes do not even notice an instant of brightness. When you stop the bright spark, the glass instantly lightens again.

Cost: about $60 – HFT Welding Visor, Gloves

And of course, these things can usually be found on Craigslist as well – I just provide the new product links for comparison so you know the base value.

Technique:

We'll leave the details of designing a specific metal thing for another article, but let's just focus on how to join two pieces of steel together.



1. Clamp ’em – you want your pieces to be locked into exactly their final angle, since as soon as you weld them, they will be joined forever. So you set them in the appropriate positions on your work table, and clamp them down, using spacers and blocks of wood or metal as needed to get the right position.
2. Connect the neutral wire somewhere – welding requires you to form a complete electrical circuit from the machine, through your work, and back to the machine again. So you clamp its alligator clip to part of your work.
3. Lower your visor, position the gun, brace yourself and squeeze the trigger. You’re welding! Sparks are flying, a quiet sparkling firecracker sound emerges from your work, and a small amount of hot smoke is swirling about. You see the small orange pool of molten steel forming at the tip of your gun. You keep squeezing, and slowly move the gun, which makes the pool of liquid metal spread along the joint. The area you left behind rapidly cools, and becomes a strong bond. The more slowly and accurately you control your liquid pool, the better the quality of your welding.

After your joint is complete, it will need quite a few minutes to cool back down before it's safe to touch (since you had it at over 2000 degrees F while welding). But even before cooling, the joints can be smoothed with an abrasive wheel on the grinder, or buffed to a nice shine with a spinning wire wheel brush (on grinder or cordless drill). Here's an example of a rough joint just after I welded it, and the same joint after a minute or two with the grinder:

Berore: Ugly. After: Ready to Admire (or Paint!)

After the welder and grinder work is complete, metal projects can be painted just like a car – with automotive primer in spray or brush-on form, and then any sort of finish. Or, they can just be left to form their own protective layer of rust, a look that is deliberately cultivated in many modern outdoor steel projects.

Nature's Casket". Note the 1″x2" rectangular tube steel.

After understanding these fundamentals, there are finer points that can be polished up by searching around on YouTube. But as with many of my introductory articles, my goal here is to show you that this new skill is fun, relatively easy and inexpensive to get started with, and for the right people, a profitable addition to a self-sufficient lifestyle.

News Flash: Your Debt is an Emergency!!

By Mr. Money Mustache

Wed, 18 Apr 2012 12:00:35 +0000

EMERGENCY Moustaches
SPINNING
Includes
'6' Moustache styles
'Cowboy'
'Rusty Brush'
'Italian Plumber'
'Oil baron'

I like to think of Mr. Money Mustache as an *advanced* personal finance blog.

We don't talk about cutting up our credit cards, or clipping coupons to save $5.00 on the newest Swiffer mop, or making a budget that forces us to save 10% of our income while we devote the rest to "guilt-free spending".

I don't talk about my own personal battle with consumer debt and how much I struggled to get out of it, because come on, I am Mr. Effing Money Mustache. I was cleaning and ironing my five dollar bills and storing them meticulously in a photo album at age ten*, *obviously* I was never going to go out and spend so much on my credit card that I couldn't pay it back at the end of the month!

This unique history and perspective allows me to see some things that are not immediately obvious to people who have been raised in the current consumer/debt society. And for all the Beginner Mustachians in attendance today, I would like to share one of these observations:

Your Debt is not something you "work on".

It is a HUGE, FLAMING EMERGENCY!!!

Let's illustrate what I mean with a few examples:

One time, I lent money to a friend so he could pay his university tuition. The cash came right out of my own bank account, and since I had already paid my own tuition, I had just enough left to cover my groceries and other expenses for the school year. After the loan, that left pretty much nothing, but I assumed that my friend would have the balance paid back within just a few paychecks.

I was therefore surprised when the friend proceeded to live a normal university life of partying and eating out, even during the delayed repayment process.

Everything worked out fine in the end, since this was an honorable friend, but I still learned something about society's differing opinions about debt.

On another occasion I was visiting some friends – a married couple. The guy was showing me his new TV and video game system. As we battled on the Nintendo Wii, the wife came home from working at the part-time second job she had boldly taken to accelerate the paydown of some old personal debts.

On the way home from work, she had picked up a bottle of wine and purchased a DVD containing some episodes of a popular TV show.

This may sound like a normal Friday night to most people, but note that *the* ***purchasing of expensive beverages, DVDs, and video games was put at a higher priority than paying off the debt***.

The girl thought she was taking a second job to pay down debt, but in reality her second job was going towards those wine, DVDs, and video games.

And finally, nowadays I receive emails from people who are working on developing their own Money Mustaches. They often detail income, spending, and debt situations. Often, there is a category for credit card debt. Yet these budget sketches also include amounts for entertainment, cable TV, and multiple cars.

The final straw was when I ventured out to poke around on some other personal finance sites last week. I found one that had a post from *one of the authors*, containing a table like this:

Mortgage: $75,000 @ 4.5% interest
Bank of America credit card: $4500 @11.9 interest
Wells Fargo credit card: $17500 @ 18.9% interest (<-we HATE this debt!)
Citibank credit card: $2900 @ 14.5% interest
We've really cut down on our dinners out and Brad has even started biking to work once a week to save gas in his 15MPG F-150 truck…

Do you see the glaring problems in these stories? If not, you have not yet developed the appropriate hatred for unnecessary debt. So let me spell it out for you.

The correct response to this sort of debt is,

"AAAAAUUUUUUGGGHHHH!!!!

THERE IS A CLOUD OF KILLER BEES COVERING EVERY SQUARE INCH OF MY BODY AND STINGING ME CONSTANTLY!!!!

I NEED TO STOP IT BEFORE I AM KILLED!!!"

Go back and imagine this person about one month after they got that first Bank of America credit card. They went out for dinner a few times a week and bought some shoes and a few tanks of gas in that first month, and eventually the bill came in the mail for $1125. They realized that they only had $600 in the bank, but that was OK, since the "minimum payment' was only $75.

In the absolute worst case, it is **at this moment** that the emergency bell should sound, for anyone in the world. The response should be:

SHIT!!!

I just totally blew it and spent more money than I earned!

I need to fix this immediately, so obviously **all** spending beyond food, and getting to and from work in the cheapest way possible, is now suspended.

No, I don't need a budget to pay back my debt, and I certainly don't need two more credit cards.

I simply need to do zero extra spending until my debt is corrected.

Logically, it follows that even if you only wake up several credit cards later and realize that you have fucked up, the emergency applies to an even greater degree.

If you borrow even one dollar for anything other than your primary house or a profitable investment, the *very next dollar you can get your hands on* should go to paying that back.

You don't space it out all nice and casual with "monthly payments", and you don't have a "budget", "entertainment allowance", or any other such nonsense. You don't start a family or get yourself a dog, and you don't go out for drinks and dinner with your friends.

There will be plenty of time for these things later, and they will feel much better when they are not set against the backdrop of Incorrect Debt Due to Error.

Don't worry, there is nothing wrong with making errors. They are actually good things, since they help you to learn. But you learn by fixing them, rather than letting them ride.

"Sure Mr. Money Mustache", some beginners will now say. *"Of course you would say that, but I'm still less practiced than you. I still need my Starbucks Lattes and my husband likes TV sports so I can't cancel cable. Can you please stop punching me in the face and let me adjust my consumption gradually instead of suddenly?"*

Wrong Attitude!

Even if you are an absolute Beginner Consumer Sucka and your goal is still to consume the maximum amount of luxury products, you are **still** cheating yourself out of stuff just by running a consumer debt balance.

Every dollar you pay in interest to the credit card company is **stealing** dollars away that you could be using for more luxury purchases for yourself.

Those dollars are gone forever, and you've permanently lowered your ability to consume luxury products, for the rest of your life. Since you *need* those luxury products so much, you'd better get out of debt quickly so you can afford to buy more, right?

The credit card debts above are eating up over $4000 per year of your after-tax salary just due to interest payments. That's hundreds of lattes, several pairs of shoes, thousands of miles worth of gasoline for your SUV, and even some massages at the spa and a couple of cross-country flights that you are foregoing every year.

Or, of course, once you start your Money Mustache, the interest savings could also be used to shave **decades** off of your mandatory working career..

And there is more good news, since this is an Advanced blog:

Your Debts Are Tiny.

I always have a little chuckle when people talk about a $10,000 debt, or even a $70,000 or $200,000 one as if it is insurmountable.

Sure, these sums of money are big when measured against the cost of groceries, and they are not sums of money to be wasted.

But this is an *early retirement* blog. Here we are learning how to rake together much larger sums of money to allow us to live our lives free from mandatory work. For most of us, that means somewhere between $400,000 and $1.5 million.

Beginners to Mustachianism find these sums unimaginable, but after a few years, the same people find their net worth spreadsheets increasing at over **$100,000 per year** due to investment returns and reduced spending.

Getting rich really is an exponential process, a concept that is hard to grasp until you realize that your money can work harder than you can. Once this higher level of financial skill is reached, you will realize that the debts of your youth were indeed small potatoes.

How do you get this elusive financial skill? If you're still in debt, you get it by getting much more bold about wiping it out. Sure, you can do it slowly, just as you can lose 100 pounds by lifting a 5-pound dumbell a few times each day while you sit on the couch and watch Oprah.

But I recommend the more efficient path: put on your walking shoes and start walking as much as you can. Eight hours a day. Go straight to the most healthy and balanced eating regime and never deviate. Stay on it and let the forward progress accelerate your progress each day. Consumer debt and excessive amounts of body fat have a lot in common.

The more vigorous method has multiple exponential benefits: every dollar of debt you pay off creates a compounding snowball of savings that continue for a lifetime. And every dollar you manage not to waste, builds your skill at saving money and learning to spend it more efficiently. These skills stick with you for life as well.

So if you still have a car loan, credit card, department store or even a student loan debt, you should destroy that as a prerequisite to beginning the more relaxed stage of saving for financial independence.

At the later stages, you can start to take it easy, but right now is the time for some hard work. Depending on your life situation, you might decide to go car-free, live with roommates, eat a vegetarian diet, take on extra jobs, delay parenthood, enjoy only local travel, and do any number of other things to get the job done. This stage will be short and effective.

Then I'll see you at the next stage, which is really where this more advanced blog begins.

Further Reading: one man's description of what it feels like to escape from over $100k of student loan debt in less than a year – by treating it like an emergency and applying some real effort to it:

* This is actually true

Nearly Free Kids Toys that Keep On Giving

By Mr. Money Mustache

Fri, 20 Apr 2012 12:00:48 +0000

Although I talk quite a bit about things like frugality, investing, bicycling, cars, and the ridiculousness of our society, it's not actually what I think about for most of the day. Mrs. M. and I still consider our main task to simply be child-raising, since it takes more time and energy than the rest of life's activities combined.

Since I'm sure many of the readers with kids of their own would agree, I thought it would be fun to share some thoughts on the most successful toys that we've ever stumbled across, just in case you and your young kids haven't already discover these things yourselves.

In our household, finding engrossing activities for the little boy is a highly valuable thing: with no TV to turn on for automatic babysitting and a kid who likes a lot of attention, we appreciate the times he gets seriously hooked into some healthy independent play. We already covered the ultimate outdoor toy (Nature), but there's still a lot of time spent inside the house that needs to be accounted for. After six years of observing his growth, certain toys and activities have shone above all others so far:

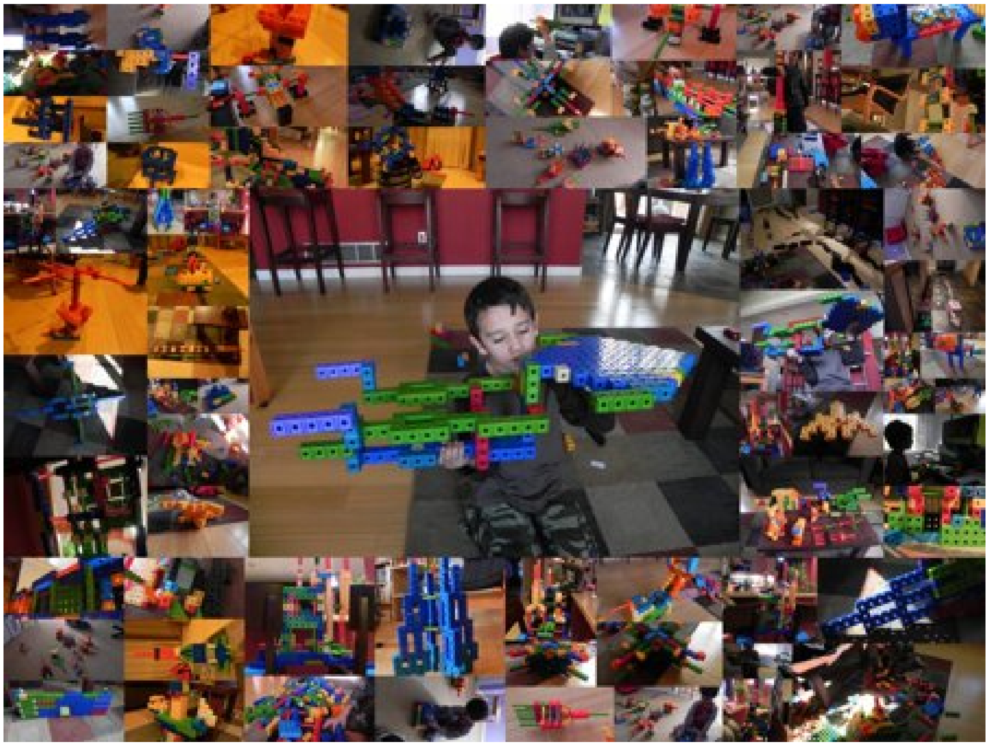
1: A whiteboard and a pack of Colorful Markers

Man Oh Man, has this ever been a successful gift. Several times a day, my son will get the urge to draw, then spend fifteen minutes detailing some elaborate picture, usually involving futuristic cities, vehicles, other planets, or scenes from books we've recently read. Then he'll come to me and ask, "Dada, do you want to ask some questions about my drawing?". There will be an extended Q/A session, at which point I am instructed to take a picture of the picture so he can safely erase it and begin anew.

Whiteboard drawing can also become a community event. At least once a day, he hosts a "whiteboard war", where we divide the board in half, draw our bases, and then have a drawing-based battle to the death – usually involving lasers. He always wins, except when battling other kids in which case the outcomes are more controversial.

Over recent years, I have amassed a network folder of THOUSANDS of digital pictures of whiteboard drawings – the collage above is just the tip of the iceberg – a few weeks' worth at most. All with one $10 whiteboard and a few bulk packages of markers. The value delivered in fun, drawing and writing skill, and plain old family bonding is immeasurable.

2: TRIO building blocks



These are like a larger (and more versatile, in my opinion) version of LEGO blocks. With a more positive clicking action, and the addition of “sticks”, which allow a sort of post-and-beam style of construction in addition to regular block stacking, Trio lets you build some seriously massive stuff (our record is a model of the Burj Khalifa Tower, standing just over 12 feet tall and reaching almost to the railing of the second-floor balcony in my living room area).

But unlike Lego, Trio is quite inexpensive. It comes in various packages at Target and other stores, the best value being the general block sets, as opposed to smaller kits designed to make a specific vehicle. I will admit that our little dude is a bit of an extreme Trio Consumer, having spent quite a bit of his own allowance to boost the size of the set – we might have $100 worth of the stuff in total. But that still puts the excellent play time he’s had with it at less than $1 per hour. If you factor in the intuitive knowledge of structural design that this type of play surely provides, it is a highly profitable activity to engage in.

3: Good Old-Fashioned Board Games, Puzzles and Kits

These are a great way to entertain the whole family at once. And while the collection looks huge and cluttery, it's still reasonably practical because it combines a bunch of games we had from before becoming parents, hand-me-downs, and gifts. Board games are a good way to deflect the Destructive Power of Generous Grandparents – instead of having them buy you things that are absolutely impractical like battery powered plastic noisemakers, you can at least channel some of the generosity into things like games and books that are actually fun to play with for more than a few seconds.

Monopoly has been an unexpectedly educational game – it forces your kid to learn to add the numbers on dice, move delicate game pieces, collect and manage money and make change, budget from limited funds, and even collect and upgrade rental properties and make trades with other players.

The Game of Life, on the other hand, is a simple lesson in Antimustachianism: Go to college – you're automatically $100,000 in debt! Now pay for a wedding: $25,000! Buy a house and car on credit too! Everything is determined by the roll of the dice, with no personal choice, because that's how real life is right? Bleah.

4: Books

This is an obvious one, but I have really grown to love the cozy escape that reading provides. My mom read to all of her kids much more than what I later learned was normal, and it became such a cherished part of my childhood that I always wanted to carry on the tradition.

When there's no TV to provide passive relaxation, books become all the more comforting – it's late in the day, and everyone is tired – too tired to draw on the whiteboard, too tired to make stuff out of trio. So you kick back on the couch and your kid(s) curl up next to you, and the book lets you float off into fantasy land for an hour or two. Blissful!

Books are another good gift deflector: I would not normally buy my own fancy shelf full of kids' books like I have here, since all the same ones are already available at the library. But family and friends send these books, so we read them while feeling thankful to the gift giver, then eventually re-gift them to another kid or donate them to the library, sharing the fun even further.

The re-gifting thing is quite practical when attending the birthday parties of other kids: no kid really wants a used star wars battery-powered toy, since those things are usually expected to be given in new condition. But they DO enjoy receiving a gift-wrapped box set of great books, with the implicit recommendation of the friend who just finished listening to them as his parents read.

Every kid has different tastes, and even those tastes change as the child gets older. But the toys above have proven to be so golden for so long that I just had to share them with you.

Guest Posting: It’s All Bullshit!

By Mr. Money Mustache

Sun, 22 Apr 2012 02:07:25 +0000

It’s the weekend, and that means Mr. Money Mustache has nothing to say right now. But the MMM reader we all know as Mr. Frugal Toque does! Here’s an interesting rant he sent me a few weeks ago, which I thought would be ideal for this weekend’s guest posting:

It’s All Bullshit!

Subtitle: Tax Software: Only 5 days left of special St. Patrick’s Day savings!

There’s a thing that happens to your brain when you watch television and you absorb Consumer Culture directly from its Unholy Altar. Your mind is invaded, pervaded, often left unsated and your thoughts are superseded by the idea that all of this over-the-top marketing is somehow natural.

I received an email today entitled “Tax Software: Only 5 days left of special St. Patrick’s Day savings!” and something struck me as odd. As North Americans, we’ve seen this sort of eye candy so many times in our lives that we’ve grown desensitized to how stupid it is. As a Mustachian who doesn’t have a TV because he somehow forgot to upgrade to an HD receiver, I’ve re-engaged the non-consumer cogs of my reasoning centres just enough for this ad to make me twitch to its stupidity.

And it is stupid. Let me tell you: it is really, really stupid.

Consider the idea of tax software. In Canada and the United States, there is only one time of year in which it makes sense for the vast majority of citizens to purchase such software. The people who market such software have a problem. How can they sweeten the pot? What ultraviolet patterns can they place upon their flowery emails to attract the instinct driven Bumblebees of Consumption?

“Why, of course,” they say, “Let us attach to our flower a four leaf clover, the brand of the nearest holiday.”

But honestly, is it realistic to believe, as a sensible, thoughtful human being, that the purveyors of this software have not carefully analyzed the market and determined the correct price point for their software? Is there any sincerity in this “special deal”?

Of course not. This is the price they mean to set to make their business case. The “sale” is nothing but a gimmick, a drop of green food dye in an otherwise honest pint of ale.

It’s bullshit. It really is.

It was after I made this realization, with many months of non-television watching behind me, that I recalled all of the other holiday based sales: Thanksgiving; New Year’s; Boxing Day; Easter; Valentine’s Day. The list could go on and on. Why should one day be any different from another? Why should anything ever actually be “on sale”? The only real deals are the things they’re getting rid of because no one else would buy them. Everything else is just a trick to get you to think they’re offering a price that’s significantly better than normal.

They might not even be doing it on purpose. Does a flower “know” what it’s doing when it lays out those ultraviolet patterns? Does it feel pleasure at drawing the bee down into its pool of sweet nectar? Of course not. The flower survives because it’s attractive to the bee and the retailers survive because they lay out the patterns that draw in their own Bumblebees.

Don’t be a drone.

Turn off your television. Not just for a day, or a week, but for months. Don’t watch advertisements. Get yourself off all of those electronic mailing lists. All of these are turning you into a drone.

It will take a while, but as you un-program yourself, you’ll begin to see how stupidly the world is run. You’ll begin to scratch your head when you occasion to run across those ads in your everyday life. Their nectar will no long smell as sweet. Their clever patterns will no longer lure you in. You will no longer be a Bumblebee of Consumption.

You will be free, and every lungful of air you inhale will smell as sweet as anything the Consumption Fanatics ever waved under your nose.

Thanks Mr. Toque, and I hope everyone had a great tax season. I for one am greatly relieved that the calculations are done, the bills are paid, and I can look forward to another year of ‘stashing.

Work Goes On… Long After the Thrill of Workin' is Gone

By Mr. Money Mustache

Mon, 23 Apr 2012 11:45:19 +0000

I almost didn't write this article for you today.

It's Sunday night, and the MMM family has had one of those enjoyable and tiring summery weekends. We were out in the sun all day, working in the garden for a while. Then the lady and boy went off to visit friends for a birthday party while I spent a few hours at the top of a ladder in the blazing heat, doing prep work on my house's siding to get it ready for painting next week. Then we all came inside, and I cooked dinner while I drank a large homebrew, ate a hearty meal, then spent an hour cleaning up the mess that the weekend had generated.

By the end of it all, I was ready for an early bedtime. I looked forward to tucking my son in and then rolling into my own bed before it even hit nine 'o' clock. But then I was struck by a brief lightning bolt of panic.

"Shit!" , I thought. "Tomorrow's Monday! Don't I usually put up a Mr. Money Mustache article every Monday morning? I don't have anything ready, because this weekend has been so much fun!"

Luckily, the lightning bolt quickly fizzled out and was replaced by a gentle breaking wave of relief:

“Wait a minute! I don’t HAVE to put up an MMM article. Who cares if it’s Monday!? I don’t have a boss I need to answer to. I’m not depending on that blog to pay for the groceries. I’ll write, or not write, whenever the hell I want.. I don’t need to follow a schedule!

The Mustachians would surely understand.. and indeed, they might even Respect a retired man taking a Monday off from “work”, just to illustrate one of the many benefits of retirement!”

Ironically enough, the train of thought flowed so nicely that I ended up getting fired up to write something about it. And so here we are, with something to talk about on Monday after all.

This idea of being relieved that work is not mandatory has actually been popping up in daily life for some time now.

Back in January, I spent a pleasant day on the rooftop of the Foreclosure Project house, soaking up some warm sun while I stripped off 80 years worth of worn-out shingles. The next day, I had an average experience heaving sheets of plywood onto the old roof structure, and cutting and nailing them into place, while that same sun beat down all day and started to make me feel a bit like an overcooked bagel. By the third day, the fun had worn off completely and I forced myself through a tedious seven hours of hauling up packages of waterproof underlayment and shingles, opening them, and monotonously installing them across the hundreds of square feet of new plywood. Measure, cut, set, nailnailnail, Measure, cut, set, nailnailnail. My hands were black, my jeans were ripped, and my mind longed to do something other than balance on a roof and install roofing materials.

“Man”, I said, “I’m sure glad this isn’t my real job. Can you imagine doing this every day, week after week, year after year, with no end in sight?”

In fact, when it boils right down to it, many jobs carry a workplace hazard of losing their thrill. Some are of course better than others: my gas station jobs didn't last longer than eight months, the convenience store was good for well over a year, and the engineering work kept me entertained for a solid decade. But at some point, for many people, the thrill of working even the most interesting job may come to an end.

At that magical and terrifying point in a job, your mind starts to race. If you're sandwiched between a wall of debt and the cliff of an expensive lifestyle that you locked in for yourself back when the job seemed fun, the joyless job can be quite scary. You've got no options, but you need the money, so you have no choice but to continue the dance.

If you've thought ahead and set yourself up with just a bit more freedom – skills in other areas, friends in other companies or industries, or savings that will get you through a year or more of unemployment – the feeling is somewhat different. Now the realization that your job sucks can serve as more of just a kick in the butt. Motivation to start looking around, stretch your wings, and embark on a challenge of finding new employment – a challenge that will benefit you anyway.

The ultimate situation, however, is to be working for the sheer joy of it to begin with. You're learning and staying challenged at all times, because if you fail to do that, there is no pretending that you are not a complete fool for taking that job when you didn't need the money. You can afford to set your standards higher, which in turn may actually make you work harder.

Would a financially independent person really sit all day in a cubicle and surf mindless websites while answering the odd email and pretending to work? NO! She'd either get some really good and meaningful stuff done, or she'd go home and read a book while dipping her feet in the swimming pool. There's no need for in-between fakeypants work when you are working for the joy of work itself.

So that's my answer to all the commenters on other websites that say, "But I don't need to save for early retirement – I love my job so I'll never need to quit!". I'm glad that you are so confident, because loving your work is a great thing. But do you really want to lock yourself in by maintaining financial dependence on your job? Wouldn't you rather be forced to love your job even more, by having the option of the feet-in-the-pool novel reading always looming over your head, keeping you honest with both yourself and your coworkers?

It sure works for me. I mean, look at that – the option of not working is what motivated me to work tonight, and ding, here’s the article I wanted! The shingle job got finished and the pain of the repetitive work faded away, and now there’s only that finished roof I get to see every time I walk by. I’ll surely grow tired of laddering around my own house exterior during next week’s paint job as well, but that job will come to an end and it will be time to think up the next job that needs doing. And this blog will never become a treadmill of cranking out articles just because a boss tells me they’re due. It can go on vacation, or it can grow bigger and better, or it can morph into a touring hiphop group or a cooking television show if that’s what fate decides.

Variety.. the spice of life!

Unlocking your Home Equity for Profitable Investments

By Mr. Money Mustache

Wed, 25 Apr 2012 12:00:03 +0000

When it comes to mortgage debt, I'm a man of contradictions.

I'm a big fan of having the *option* of tapping your home equity to meet short-term cashflow needs, as I explained over a year ago in "Springy Debt instead of a Cash Cushion".

On the other hand, I'm also a fan of paying off your full mortgage balance in the case of early retirement, since it provides a stable return equal to the interest rate of the mortgage you're paying off, reducing the risk of trouble during economic storms of the future. A mortgage-free primary residence is the biggest factor that keeps the MMM family's living expenses so low these days (around $2000 per month).

But mathematically, if you don't mind higher risk, the odds are still in your favor if you leave your house leveraged and invest in higher-yielding assets. As noted in "Pay Down the Mortgage or Invest More?". In that article, we learned that today's cheap mortgage debt is a very useful tool in the hands of a skilled real estate investor.

In the area of rental houses, I have also taken the most wimpy and conservative path: I have one rental with no mortgage at all. Even though the case for keeping a mortgage on your rental property is actually much stronger than that for your primary house. The reason is taxes:

You'll often hear people repeat the slogan "In the US, mortgage interest on your primary house is tax deductible". But it's actually not true for many of us, because of a concept known as "the standard deduction. Here's a quick example to illustrate:

Imagine a couple, filing under the "married filing jointly" tax category with $100,000 in combined income and no mortgage debt. They got to claim a "standard deduction" of $11,600 on the 2011 taxes that they just filed earlier this month.

Now imagine an almost-identical couple with a $200,000/4% mortgage on their house. Their mortgage interest was about $8000 for the year, and property taxes were $1500. Both those items are tax deductible in US tax law, so they type them into Turbo Tax.. and… the program informs them that they'll still pay less taxes by taking the Standard Deduction of $11,600.

So in fact, you could say that mortgage interest for couples is only tax-deductible on the balance of your mortgage between about $250,000 and $1 million, the upper limit for the mortgage deduction. Most people, especially those hoping to amass great wealth, try to avoid mortgages in those higher ranges. (For single tax filers the standard deduction is halved to $5800, but the impact is still significant).

But the situation is different, and better, when you start talking about investment properties. On the rental, every dollar of mortgage interest is 100% deductible off of your taxable income for the property. And you still get to keep the full standard deduction on your personal return. This is a significant benefit, especially for people in higher tax brackets.

So now we're about to get to the point. I've been doing some investment property shopping in my neighborhood in recent weeks, and I think I'd like to pick up a second rental sometime soon.

In fact, I might even buy the house next door to me. It's currently tenant-occupied, as the original owner moved away several years ago. The owner is an older lady who is clearly frustrated with the experience of being a landlord. She also lives in another city, forcing considerable commuting time onto her when she needs to tend to the house. With a shortage of cash and no carpentry skills, she keeps the place in less-than-beautiful condition, which reduces her rent income, and provides a daily eyesore for me. If I could buy it and make it beautiful, I could rent it out for $1600 per month, providing a great return on my investment. It would also increase the eventual resale value of my own house and the entire street, so any upgrades I complete will generate payback in multiple ways.

Don't tell her I'm thinking of this, however, or she'll raise the price on me.

My choices to pay for it would be:

1) Pay cash for the new investment property.
PROS: The ultimate in convenience and fun.
CONS: Ties up a lot of cash, and I don't even have enough cash to do it right now.

2) Get a conventional mortgage to buy the new place.
PROS: fairly simple
CONS: slows down the home-buying process, locks you out of the best fixer-upper deals, since they are typically in a condition that will not qualify for a mortgage, and increases your costs since you need to pay lender and appraiser fees.

3) Use my existing home equity line of credit.
PROS: Same convenience as cash, since you're just writing a check. But keeps cash free for other investments. Ultra-low 3.25% interest rate.
CONS: Interest is not tax-deductible as noted above. Decreases or eliminates my cash cushion, which is a safety margin I'd like to keep. Line of credit is not currently large enough to buy a typical investment house

around here, although I could expand it, for a fee. Would need to pay back balance in full if I decide to move.

4) Get a line of credit on the existing rental house, and use it to buy a second house in "cash".
PROS: Same convenience as cash, tax-deductible, keeps all other funds available for use. Automatically gets paid back if I ever sell the existing rental house.
CONS: Slightly higher interest rate due to it not being a primary residence. May need to pay fees to set up this line of credit.

So I'm leaning towards #4. And I want to do it pretty soon, because Mrs. Money Mustache is about to quit her cushy part-time job to pursue new adventures. If I apply for the line of credit while our family income is still higher, we'll qualify for better loan terms.

Update! *After learning more about the tax laws of this situation, I decided to go with option #3. Interest paid on a primary home line of credit is INDEED tax-deductible directly against any business income you earn with the loan. So you don't get into the mess with the standard deduction noted above. Thanks MMM readers!*

What now?

Now I'd like to turn it over to you. Who among the Wise Mustachian readers has extracted value from a rental house in the past? Where would you recommend that I look to get the best experience and a great deal? Or do you think I should go for the standard style of mortgage if the house next door qualifies?

A few ideas I've had so far:

- My business bank, US bank, has a whiteboard out front advertising 3.25 or less% home equity lines of credit with no closing costs.
- I've heard that lendingtree.com might get reasonable results. But I've never used it. Has anyone had positive or negative experiences in that area?

- I know a wheeler-dealer independent mortgage broker who is very honest, competent and operates on commission. He dishes out loans from a variety of financial companies, and he's always up-front about total costs. It probably wouldn't hurt to give him a chance at earning the business as well.

The ideal situation would be that I go through the paperwork and end up with a nice fat $200,000 line of credit on my existing rental house, with a low interest rate and minimal closing costs. Then I will be armed and ready for business, and you'll get to read about the total gutting and remodeling of the house next door sometime this fall!

What do you think?

Nicer Legs and Some New Carpentry Skills – for Only 15 Bucks

By Mr. Money Mustache

Fri, 27 Apr 2012 12:00:23 +0000

With the weekend almost upon us, I imagine many triple M readers are looking for a productive and enjoyable activity that will fulfill all three tenets of the Holy Trinity of Mustachianism:

– Increasing your health
– Increasing your wealth
– Building new skills and life satisfaction

As luck would have it, I have a nice one for you today. After publishing the "getting started in carpentry" article, several people started throwing around ideas on the forum for useful do-it-yourself projects. One of the most useful ones that came to mind for me was the "Jumping Box", an exercise accessory that I only recently learned about through Mrs M's crossfit workouts.

It’s a great first-time project to build, because it’s simple, cheap, and relatively forgiving of imperfect construction methods. Yet it also quite useful, because it can provide a lifetime of free exercise, plus it can serve as a spare chair or table, and it can even be used to generate income (more on that later).

After trying one of these things out in the Crossfit gym, I was instantly hooked. The basic idea of the box is this: It’s a 20″ high pyramid of sturdy plywood. You stand in front of it. You jump to the top of it and catch your balance. Then you jump down to the mat, bounce quickly back to the top, and regain balance.

The exercise provides a great combination of heart-pumping cardiovascular work, calf, quadricep, and hamstring muscle building, and balance and core strengthening as well. Plus it’s really fun, because hey, you’re Jumping! How often do you do that these days!? Jumping is for joy.

And it can be scaled to any degree. You can build a 12 incher or a 30 incher. I made a 20 for this article because it’s comfortable for most moderately fit people. If I want to make the exercise more strenuous, I just hold a pair of 25 pound barbell plates during the jump, as shown in the pictures (this also adds a bonus upper body component to the exercise as well).

One of the best parts of this project is that you make it from only about half of a single 4×8 sheet of plywood (I recommend 3/4″ thickness). Those sheets cost under $30 at a building supply store, so you’re really getting a great part of a home gym for about the price of a single drink on a cruise ship. So let's get started and build this sucker.

The first step is to cut a long strip of wood that is 18.5 inches wide and the full 8 feet long. The hitch? You need to set your saw at a ten degree angle before making the two cuts to form the strip. Here's what that looks like:

This is even easier with a table saw, but I'm showing it with a circular saw since more people have those. Even an 18V cordless saw as I'm using here has plenty of power to cut plywood.

You make two cuts, with the saw running the same direction, so you end up with a piece of wood that is a parallelogram when viewed from the end.

Next, you will be sketching trapezoid shapes on your new strip of wood. 23.5 inches at the base, 17.5 inches at the top:

Draw in your lines with a pencil and

ruler (click on any of these pics for a larger version)

When you're done sketching and ready to make the two cuts, remember to set your saw back to a zero-angle (square cut) and go for it. Then take your new trapezoid, spin it around to match the freshly cut angle on the remaining long board, line it up, and TRACE its right hand side, to give you your next cut line:

Here I rotated the first piece 180 degrees and traced it, to make a duplicate copy.

Cut that second line. Wow, you've already almost halfway done the cutting. But don't go crazy and start tracing that piece again. You've just made the two LONG sides. Now you need to make the two SHORT sides, which allow for two plywood thicknesses, yielding a square box when you put it all together.

To accomplish this, measure across 22 inches at the bottom, and 16 inches at the top. Draw that single line, and cut out the piece. Then rotate it 180 degrees and trace it again, which will get you to this point:

Now you've got all four sides. You can write "Long" and "Short" on them and line them up like this:

Now you take a Short piece, add some wood glue to its end, and butt it up against the flat side of a Long piece. Be careful of those 10 degree angles on the bottom and top: you want to orient them both so that the ends sit flat on your work table and provide a flat top when assembled into a pyramid shape:

Here are two steps pasted into one

picture: glue the end of a short, then
stick it to the long

To make the attachment, I like to use a 16 gauge nailgun with 1.5″ nails. But if you don’t have a nail gun, you can also use 3-4 screws with a 1.5″ length as well. In this case, you’ll want to first pre-drill the holes to avoid splitting the plywood. A 1/16″ or 3/32″ drill bit might do the trick.

So you take a Long, and attach a Short. Next, attach another Short, and you’ll have this:

Then you put on the last Long, and flip the whole box over so you can trace the top and cut it out:

Attach the top, and you are pretty much ready to start Jumpin’! But you’ll probably want to consider these optional enhancements:

Interior reinforcement: For larger boxes, heavier people, or professional use (i.e. if you are building the box for a crossfit gym), cut out four 18″ sticks of 1.5″ by 1.5″ wood, and glue and screw them to the interior corners like this:

Nice Handles: Measure down 4″ from the top, in the center of the box. Then make dots 2″ to each side of that. Draw a 1.5″ circle, centered on each dot (perhaps by tracing a lid from your recycling bin). Or use a hole saw in a drill. Connect the two circles, and cut out with a jig saw. It sounds a little complicated, but really all you're making is this:

When you're done with the handles, the last step is simply sanding and finishing the box. I leave mine unfinished, but I am fond of a nice sanding job with a belt sander. The finished product looks like this:

Isn't that a beauty!? .. and these things are quick to make once you get the hang of it. The first one I ever made took less than an hour, and the second one was much faster than that.

Bonus Income Generation Idea!

A confluence of events has aligned to make it possible for an entrepreneurial Mustachian to make some great side income by making these boxes for other people: The "Crossfit" workout method has taken off and become a nationwide trend. Gyms are popping up in every city. Everybody, including all the crossfit gyms, wants these boxes. But most people do not have any carpentry skills, and the boxes are too big to make and ship cost-effectively from China – or indeed to ship at all.

So, depending on features and finish, these things can easily sell for between $50 and $100. But the raw materials are about $15 and less than an hour of work (probably as low as 15 minutes per box if you streamlined production and did them in bulk).

I made my first box of this type a few weeks ago and started using it regularly for workouts. But then it disappeared from my basement – Mrs. Money Mustache had SOLD it for fifty bucks to one of her crossfit amigos! So I made a second one for this article, but there are already requests to purchase it as well. I'm not going to start cranking these things out, because that would be too much like a real job. But that leaves the door open for anyone else who would benefit from a second job, to make a few boxes on weekends. If you were a high school kid, would you rather punch keys on the Target cash register for $8 per hour, or polish your woodworking chops in your parents' garage for closer to $50? Yeah, I thought so.

See you in the air!

The Cost of Living is Too High These Days, Waaah, Waaah!

By Mr. Money Mustache

Mon, 30 Apr 2012 11:59:23 +0000

Just one of the necessities of today's difficult lifestyle

On the forum section of this blog, we've got a section called "Antimustachian Wall of Shame and Comedy". This category became necessary, because sometimes the real world out there just *begs* to be mocked. MMM readers around the globe are dutifully reading and absorbing the world's information, and sometimes we come across crap that is so frustrating, so pull-out-your-hair-by-the-roots and slap-yourself-in-the-forehead-because-there's-nobody-else-around-to-punch-in-the-face stupid, that we must share it with each other as a stress-relieving outlet.

So, these articles get shared on the aforementioned Wall, and then appropriate sarcasm is combined with helpful proposals about how the problems described in the articles could easily be solved with simple application of the principles of Mustachianism.

The trend in recent years is for newspapers and magazines to write touching case studies based on the theme "Life has become so hard and expensive these days, that even the high-income people are having trouble making ends meet!"

Let's summarize a few choice examples:
Almost Rich: an Examination of the True Cost of City Living (in Toronto Life magazine)

That article details five Toronto families, struggling supposedly due to the incredibly high cost of housing in that city. I won't deny that houses are a ripoff in the Toronto area, but check out these snippets from the monthly budget from a $196,000-per-year family that is just scraping by:

> Mortgage : $2,500. Utilities: $500. Gas for their Jeep Commander and Ford F-150 truck: $440. Street parking and two parking permits: $200. Home and car insurance: $300. Cleaning lady: $160. Groceries: $1,000. Baby supplies and toiletries at drugstores: $75. Wine: $400–$500. Eating out: $400. Home phone, cable, Internet and two cellphones: $280. Dry cleaning: $50. Haircuts, nails and waxing: $170. Gifts: $200. ("You have kids, you spend money on toys for other kids. That's how it goes.") Daycare for both kids: $2,500. Kids paid activites and lessons: 200. House maintenance: $410. Clothes: $250
>
> Savings: $0 ("Ha! We live month to month. When we have money left over, we go out.")

Next we move on to The Real Cost of Living: $150,000 per year at money.msn.com

This a news venue where Mr. Money Mustache himself was once featured unexpectedly, and was roundly criticized in 14 pages of comments for fabricating his ridiculous story of spending less than he earned during his 20s and early 30s.

The Real Cost of Living MSN article basically talks about the results of a recent survey done on the US populace, with the following result:

> The survey asked respondents to choose which of four categories best described them: I can't even afford the basics; I can barely afford the basics and nothing else; I can afford the basics plus some extras; and I can afford the basics and the extras, and I'm able to save, too. It is only at that $150,000 level that the survey found the vast majority of consumers, 88%, saying they could buy what they need, afford some extras and still be able to save a bit.

Finally we have a feature from the Bloomberg financial publication entitled "Wall Street Bonus Withdrawal means Trading Aspen for Coupons".

In that article, they describe the tragic fate of a man named Andrew Schiff :

> Schiff, 46, is facing another kind of jam this year: Paid a lower bonus, he said the $350,000 he earns, enough to put him in the country's top 1 percent by income, doesn't cover his family's private-school tuition, a Kent, Connecticut, summer rental and the upgrade they would like from their 1,200-square- foot Brooklyn duplex.
>
> "I feel stuck," Schiff said. "The New York that I wanted to have is still just beyond my reach."
>
> The smaller bonus checks that hit accounts across the financial-services industry this month are making it difficult to maintain the lifestyles that Wall Street workers expect, according to interviews with bankers and their accountants, therapists, advisers and headhunters.
>
> "People who don't have money don't understand the stress," said Alan Dlugash, a partner at accounting firm Marks Paneth & Shron LLP in New York who specializes in financial planning for the wealthy. "Could you imagine what it's like to say I got three kids in private school, I have to think about pulling them out? How do you do that?"

Now obviously, the first thing that you'd need to do if any of these people came to you to express their problems, would be to cry out "WAAAAH! WAAAAAAH! POOOR BABY!!" while slapping their face back and forth for 15-20 minutes. But after that initial theraputic session, you could probably get into some real insights.

Why is it that almost everyone in this ridiculously rich country feels that they are just scraping by?
Why do only the top 1-2% on average feel a bit better about their situation?
Why do the Wall Street people feel like they are STILL scraping by when they are in the top 1%?

and equally significantly,

Why do Mr. and Mrs. Money Mustache feel they are NOT just scraping by with a monthly spending level of only $2,000, about 80-90% less than most of the people profiled in this article? In fact, they claim they are leading an exorbitant lifestyle with spending that is almost double what they would consider to be "just scraping by". And what's more, they are not even spending all of the money they are earning, even with no full-time jobs!

What the hell is going on? One of these two sides of the argument is crazy. And if it's the big income people that are crazy, that means all the newspapers are crazy too, since they regularly sympathize with the commonly made case that life is too expensive these days, profiling family after family that just can't make it.

I think I've figured it out. Not many people realize it, but food, clothing, housing, durable goods, travel, and a host of other things are cheaper today than they have been throughout most of history. These prices have actually been dropping in inflation-adjusted terms for decades. So if you focus your spending on meeting your *needs*, as the MMM family likes to do, you couldn't have been born at a better time. Life is fantastic.

On the other hand, corporate marketing skill and consumer envy have been rising *faster than inflation* for quite some time. On top of that, the very richest slice of the population has seen its income rising much faster than inflation. They have fallen for the natural human instinct to live very lavish lifestyles with this giant income, which sets an example for the not-quite-as-rich people just below them in the income distribution ladder, who then influence the next level down, and so on.

This Antimustachian Trickle-Down Effect has been so effective, aided by the lubricant of excellent marketing, that we now have people who make

$40,000 per year thinking it is appropriate to hire a housecleaner and pay $45 for salon and spa treatments on the weekends. Teenagers who earn $8 per hour drive jacked-up pickup trucks that cost more than the MMM family's entire vehicle fleet and consume more than $8 per hour in gasoline alone.

So when you see all these articles which measure the number of people who are in debt and struggling to get by and unable to save for their own retirement, what does it mean?

It is NOT a measure of how the cost of living has suddenly reduced its decades-long trend of marching downwards due to technological progress. What you're seeing is **a measurement of how well marketing and natural human envy is doing in our current society**.

Isn't that interesting? All of these complaints and stories actually have nothing to do with making ends meet. They're really just measuring our insatiability. And it is indeed very interesting to see that it is rising – this data may in fact be more interesting than what the news reporters *thought* they were writing about, i.e. cost of living.

Of course, there are still a few people around who realize how good we have it. Most of them are right next to you on the Internet reading Mr. Money Mustache today. But they get a lot less newspaper stories written about them. That's because people who have got their shit together are considered "Smug". Newspaper stories do much better when they make people feel like their problems are not their own. Better to blame our terrible and expensive society. Waah, Waaah!

Because of their sensationalist leanings, I've pretty much given up on most newspapers. But I'm thankful to have the Wise Mustachian Readers still out there combing the Internet, and reporting the worst of the worst for our amusement.

Happy Monday, and Enjoy your Plentiful week!

*I looked it up, and Andrew Schiff happens to be the brother of and an employee of Peter Schiff, megamillionaire owner of Euro Pacific Capital and author of the bestselling yet rather insane book I just read called Crash Proof 2.0.

Reader Case Study: I’m Rich and Life is Perfect – Now What?

By Mr. Money Mustache

Thu, 03 May 2012 12:00:03 +0000

These reader case studies sure are fun. First you get to engage in a little voyeurism as you peek in on another person’s life. Then you can actually compliment them, offer advice, or throw out a few Mustachian Face Punches as you see fit. All to a real person, and all from the comfort of your own office chair.

Because of the popularity of this series, I’ve tried to mix things up and share reader stories with widely varied situations. We’ve had everything from Minimum Wage up to Big Law Firm workers. But in general there has always been some problem that needs to be addressed. Massive student loans, cars bought on credit, people hoping to save for a house, or people trying to find a way to quit their jobs.

There’s still a category that has remained untouched. But when I think about the essence of Mustachianism, it’s not a rare situation at all. In fact, it’s a situation that is many readers of this blog are already in, and most of the rest will eventually get there.

The situation is of course **having a great life with no monetary problems whatsoever!** But there’s still an unusual twist in this one, so read on:

Dear MMM,

…

We are young couple (early thirties) with two children (early teens). Through a combination of hard work and good luck, we are very fortunate to have healthy finances. We paid off our mortgage, student and car loans off as early as we could, and our only debt is a charge card that we pay off every month (in order to earn the rewards points). We have about $1,000,000 in assets: we own our own home, we have savings for college, our retirement is partially funded and we have a substantial buffer for emergencies. We spend a very large amount, but still save between 40% and 60% of income each year.

Income:
Me: About $7300/month (after tax, health care and max 401k savings), plus about $300,000/year in bonus (fluctuates depending on business success).
Spouse: $0 paid income, but works a heck of a lot harder than me!

Expenditure:
School Fees: $3667/month
Misc.: $3250/month
Travel: $2500/month
Food: $1500/month
Children Activities: $1500/month
Summer Camps: $850/month
Social: $700/month
Car Repairs: $475/month
Legal Fees: $417/month
Charity: $417/month
Car Running Costs: $300/month
Insurances: $300/month
Phone: $270/month
Dog: $200/month
Cable: $200/month
Water: $200/month
Dry Cleaning: $100/month

Power: $100/month
Security: $32/month
Gas: $30/month
Total: $17,000

Items in italics are the emergency budget: $3179/month.
Annually, we earn about $400,000, and spend about $200,000.

As I said, our profile is quite different from the average. Our expenditures are very high, but here are a few caveats:
– About 40% of our expenses (esp. school fees and activities) could be considered “investments” in our children, their education, skills and hobbies. (my wife gave up her job to take care of them full time, I spend 1-3 hours a day with them, they do lots of activities and are fortunate to go to an excellent school), and they are 8-10 years away from being off our payroll.
– We have structured our bills so that we could quickly cut down to about $3200/month if I lost my job – a level that could comfortably be covered by savings and my wife returning to work.
– Our expenditure is funded out of past income: no way would we be spending this much is we had debt.
– We spend primarily on experiences and not on stuff: our house is small (about 1500 sq ft) and our garage is empty except for two cars (average age, 8 years). We are not people who buy lots of expensive toys. Instead, we buy expensive holidays and activities.
– I enjoy my job and my life: I am in no hurry to retire. If I did leave my current employment, it would likely be to do a similar thing for my own company.

So, what do you think? We could obviously spend much less and save much more, but to what end? We have no debt, ample savings and I am not in a hurry to retire. We enjoy the things we spend our money on, especially the children and the travel.

It is a very pleasant dilemma, for sure, and we were wondering what your thoughts would be.

Well, that’s an interesting one.

I can't really hound this guy for any sense of whining or entitlement, since he has acknowledged that he spends a lot and has a healthy attitude about it. But it's still a shock to see a number like "Bonus: $300,000" just slapped onto the end of an already gigantic income statement. So where could he improve?

1: Figure out if You're Missing Anything

I suppose my first question is "are you SURE you aren't missing out on anything by living such an expensive lifestyle?". I will not question that you are having plenty of fun right now. But with a budget so large that even your "Misc" category is 50% larger than my "Everything" category, it is certain that we are living very different lives.

When you live a life like that, you're probably spending very little time doing things that are free. But as I've contended in the past, many of the best things in life are free. Things based on using your own body to its fullest, and Nature.

I've often said that my own family couldn't imagine spending any more than we already do right now, even if we had way more money. In fact, we *do* have way more money, and yet we still don't spend more. So it *is* possible to lead a happy life on less.

So why might you want to do it? I can think of one big, great reason:

2: Break out of your Comfort Zone at least Once a Week

To live life to its fullest, you need to be challenged. With a job like yours, there is obviously plenty of challenge and satisfaction in work. But with no need to be efficient with money, you might be missing out on golden opportunities to expand your comfort zone. Do you ever travel to non-luxurious areas? Camp? Hike to the top of mountains? Walk through poor areas in third-world countries? Ride your bike in a blizzard or carry your groceries home without a car? Difficult things make life exciting and worthwhile, and with too much money, you might miss out on precious difficulty.

3: Are your Kids Learning about Scarcity, Hard Work, and Struggle?

One of the worst punishments you can give a kid early in life is the reassurance that they will never have to be careful with their money, stay up all night to work hard on projects, or save for their own retirement. I believe that people do best if they are forced to make their own way in life. Sure, you want to offer love and practical and emotional support.. but cash handouts can often backfire.

Also, do your kids know how unusual their situation is? Will growing up rich affect their ability to get along with people who had less wealthy upbringings? Are you dooming them to lives of hanging around with only big spenders, meaning that they'll end up very poor if they don't happen to choose careers that also pay $400,000+ per year?

Every young adult should be able to comfortably sleep on somebody's floor, drive an old manual-transmission car with rust holes to a concert, and eat leftover pizza for breakfast. Without complaining. Be sure you are not creating any new Paris Hiltons.

4: How Long until you're Covered for Retirement?

To support $200,000 in annual spending at a 4% withdrawal rate, you'd need $5 million in savings. With only $1 million right now, you might need to work for about 15 more years even if you save $200,000 per year until then. As shown in the Shockingly Simple Math post, financial independence depends solely on your savings rate rather than your income, and my own savings rate was higher than yours through my late 20s even though I earned less.

This might not be a concern since you like your job so much. But as a cautious person my natural tendency is still to suggest that you place a higher emphasis on buying your freedom first. With an asset base of only 5 years of spending, some would say you're jumping into the high life just a bit too quickly.

If you experiment with living a less costly life, you just might find that you like it more, and you have less of an interest in spending so much on yourself. Since your urge to work and produce will be unaffected, this naturally will increase your interest in spending on others and the betterment of society, the planet, or any other causes that become important to you. Then you open up a whole new area of life satisfaction – that of service to others. I know, it sounds crazy initially, but it has been know to catch on for many ‘a’ rich person.

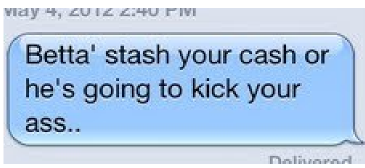
The advice above should be viewed as just some friendly knuckle rubs rather than any sort of serious punching. I’m glad you’re doing well in life and you’d be fine even without lifestyle advice.

But from what I’ve read, I see an opportunity for greater Badassity in your life by finding a way to bring back at least a teeny bit of good old-fashioned Hardship.

Wow.. how ’bout that Comments section?

By Mr. Money Mustache

Fri, 04 May 2012 20:53:06 +0000



You know what I love about all you Mustachians? It’s how much you like to share whatever knowledge you can in the name of helping out other people.

When you look at the comments section of new articles these days, they rapidly become packed with really neat thoughts. (Especially if it’s a reader case study, or something relating to kids or, oddly enough, food). Increasingly, the new articles are setting records to the point where they end up popping up in that “Popular” tab to the right, so that it might as well just be a renamed “newest”. There have been over **10,000** comments on this blog in its 1.1 years of life, and I’m pretty sure I have read them all.

You might say, “Yeah yeah.. that’s just normal, every blogger is proud of their little community, and this is nothing unusual”. But it IS very unusual – we now get as many comments as the very biggest finance blogs in the world, yet according to my scientific sampling, your comments are far more useful. In fact, some people tell me that this is the only site where they read any comments – yet here they make a point of reading all of them, because they’re at least as interesting as the articles themselves!

The Forum is even more crazy, with about the same number of posts as the main blog and close to a million page views all by itself … since it opened less than 3 months ago. It’s all useful stuff with little to none of the pointless complaints or mindless fluff that permeates the broader Internet's comment sections or forums, and it's all instantly searchable through the website's built-in search boxes.

But if this great craziness continues, we might soon surpass the scale of time that even a dedicated person can devote to reading comments. The volume could become too great to read and approve carefully, eventually leading to vast swaths of repeating arguments and one-liners like you get in a popular YouTube video or MSN article. The comments section needs to have a way to become self-limiting, so here's an idea on how we might do it:

One reader proposed that we add a voting or democratic ranking system so that more popular comments rise to the top (similar to the topic-voting system on Reddit). That could be neat, although it might add more formality and competition than we need here.

So how about this:

If you're thinking of writing a comment, just be sure to read every OTHER comment on that day's article first. That will prevent people from writing the same idea more than once without realizing it, and it will also make it more and more daunting to add a comment as the list grows, because the amount of homework you have to do first will be so great. Who would read 200 comments and still have something unique to say? I don't know, but we'd probably end up getting some VERY interesting things said towards the end of the list.

What do you think? I definitely don't want to become bossy or in any way compromise the cool dynamic that has formed so far. But on the other hand, I want this place to remain a nice, sane hangout that is more like a meeting table in a library, than a parking lot in a shopping mall during the holidays.

Let's just keep the idea on file, and if newcomers start getting too rowdy in the future, we'll refer them back to this post so they can be schooled on The Rules.

What Do You Mean "You Don't Have a Bike"?!

By Mr. Money Mustache

Mon, 07 May 2012 18:31:46 +0000

Mustachianism has many facets. It's a lifestyle and a fake religion all in one. And it is packed with an unlimited number of deep and interesting nuances, which is why you and I still have something to talk about after 13 months of this blog's existence and 224 published articles.

But if I had to strip it down as far as possible, down to just one single action, and I wasn't allowed to talk about anything else, the choice would still be simple: "Ride a Bike".

It's a simple concept which expands to an infinite degree as you think about it more, which we'll do in just a few paragraphs. But by understanding how important this core concept is, you'll understand why I get so excited at moments like the one in the following story:

I was outside talking to one of my neighbors last week. We were making the usual small talk, discussing the beautiful weather we've had this spring, the minor hardships with keeping our lawns and gardens green in the absence of rain, and various other across-the-driveway filler chitchat.

Then the topic of gas prices came up. This girl was hoping that we would not see further increases in the price of gasoline this summer, since her budget was already stretched tight.

I expressed some appropriate fake sympathy, but emboldened by my secret life as Mr. Money Mustache, I decided to at least see how this unsuspecting person would respond to a taste of Mustachian advice.

This particular lady recently bought a V8-powered Jeep Grand Cherokee, and she happens to work at a company that is exactly 0.5 miles from our street. Yet she drives to work – every single day.

"You know, I only have to buy gas every 2-3 months for my car, because I just bike everywhere. With your work less than a 5 minute bike ride from here, have you ever considered walking or biking?"

"Yeah! I've noticed how you guys always bike, and I think that's pretty cool", she said. "Yeah… I should really bike to work. It's just that, you know, I don't really have a working bike right now".

I've had nearly the same conversation with many people in recent years, so I've learned to remained calm on the outside when I hear excuses like this. But inside I could only scream "**WHAT THE HELL DO YOU MEAN *YOU DON'T HAVE A BIKE!?!?!?*"**

The concept is so foreign to me because it is so illogical. How can anyone with sufficient mental capacity to pass a driver's test, or indeed to dress themselves in the morning, not realize the folly of living a life that includes a working car, but no working bike?

Bikes are virtually free, and require no insurance, registration, license, parking spaces, or any other hassle. They are so easy to own, and so incredibly useful and beneficial, with absolutely no drawbacks whatsoever to ownership. And yet somehow, there are adults out there – millions of them, a majority of them in the US – who don't even have a bike.

My neighbor is paying thousands of dollars a year to idle around town in a 300 horsepower truck that gets 12 miles per gallon in the city, even while her body is crying out for extra exercise that it is clearly not getting enough of.

Even crazier is that there are readers of this blog who are *sort of on board* with leading a more natural and rich lifestyle, and are interested in the idea of maybe trying a bit of bicycling someday, but just haven't gotten around to it because, you know, they don't have a bike, or they have an old squeaky one with a broken gearshift or some flat tires. Or perhaps they have managed to convince themselves that their car-based lifestyle is justifiable, and maybe that bike fanaticism that Mr. Money Mustache displays can just be ignored and they'll just follow *the rest* of his advice, while ignoring the bike parts.

It's time for this silliness to come to an end. **You must ride a bike. We all must.** It's not a weird fringe form of transportation that only people in Portland and Colorado do. It's just simply the way we *all* get around for moderate intra-city distances.

The reason this rule is so hard and fast and set in stone, is that the bike secretly does more than just getting you around town. If it were as simple as multiplying your bike miles by 50 cents and saying "Therefore every twenty miles you bike saves you ten dollars of driving costs", it would be a purely financial decision. Then you could weigh biking and driving against your other lifestyle choices and come up with a balance that still lets you save 50-75% of your income, ensuring financial independence at an early age. But no, biking is not just about the money.

Biking is also more than just a form of exercise. If you follow my advice and start biking around when convenient, you'll find that you end up cycling for perhaps three hours a week. You could say "that's just the same as visiting the gym for three one-hour cardio workouts each week. If I do that, THEN will you get off my back about the biking?"

Nope, I still won't get off your back, because it's even MORE than the money and the exercise.

A bike-based lifestyle is an all-encompassing change for the better. It's like rolling back the past hundred years of humanity's clueless paving-over of the surface of the Earth, without having to sacrifice a single benefit of modernization. It's like shedding all of the stress and responsibility of adulthood that have crusted over you and going back to being eight years old again.. without losing an ounce of that golden power and freedom that comes with being an adult.

A bike is really an **automatic life balancing machine**, passively creating harmony in your life better than even the bossiest life coach could hope to do. You're automatically forced every day to venture just a tiny bit out of your Comfort and Wussiness Zone. Suddenly you are blessed with the opportunity to use your mind and actually strategize just a bit each time you venture out… "How will I dress for the weather?"… "what will I be carrying with me?".. "what food and drink will I require for this journey?".

With the tiny daily overhead of this planning, you become a more thoughtful person in general. The Edge of the Planner starts to creep into the other areas of your life: "I heard this new TV show is really good. Maybe I'll relax and watch a few episodes… WAIT.. on second thought, maybe I'll look at my to-do list and use this time for something ELSE! Aha.. I see I was supposed to look into re-financing my mortgage. I hate making those calls, but I'm going to do it. I'm a PLANNER now, no longer a passive observer of life."

The challenge of biking also automatically limits the amount of time you spend uselessly circling the retail establishments of your town: "Do I really need to go out to the store to pick up that bottle of shampoo today? It's a pretty long ride, and I'm going to need to go tomorrow to get bananas anyway. I'd better put it on tomorrow's list. And I'd love to check out the shoe store someday, because I love just browsing through the shoes.. but that's way on the other side of town. Surely there is something else I could do closer to home that is more valuable."

All from just a 25 pound collection of aluminum and rubber you can lift with one arm. Becoming a regular cyclist really is that good – conduct your own interviews with bikers if you think I'm just making all of this up. They will agree – cycling is being Alive.

So when it comes down to the excuse of “I just don’t have a working bike right now”, you can see why I become so frustrated. Not biking because you don’t have a bike is like letting the excrement pile up on your bathroom floor because “I just haven’t flushed the toilet recently”. JUST GET A DAMNED BIKE!! IT’S SO EASY!!! It’s too important to let laziness prevent it from happening!

How to Buy a Bike:

This is an area where MMM readers will rightfully diverge, depending on their expertise and interest.

My own recommendation: the important part is not where you get the bike, or how much you pay for it, it is simply that you *have a reliable, working bike at all times* so you never miss out on any possible riding opportunities. The cost of even a moderately expensive bike is *tiny* compared to the benefits it will bring, which is why I think it’s fine for people to buy brand-new bikes from a local bike shop or from an online store like Nashbar or Performance bikes, if that will increase their chance of having a working bike sooner.

Cautious beginners don’t need to mess around trying to find values on Craigslist, and they definitely don’t need to buy a $20 bike at a garage sale, hoping to someday get it working well despite having no mechanical knowledge. These people need a instant gratification bike that will work reliably for long enough to get them hooked into the biking habit. This is a machine they will hopefully spend many hours riding every month, so it’s important that it works smoothly, comfortably, and does not fail at its job of getting them around.

As your skill with mechanical things and your interest and experience with bikes increases, so does the value of looking for used ones. Some retail stores like Play it Again Sports, and community sharing websites like Craigslist, can prove to be a gold mine in this area. And the best used bikes are often found by asking your most bicycle-savvy friend where they would get a used bike if they were shopping.

This guide by MMM reader Bakari Kafele provides a nice tutorial on how to shop for a used bike:
http://biodieselhauling.blogspot.com/2012/01/buying-bikes-from-craigslist.html

When shopping for a new bike these days, I use an even simpler algorithm:

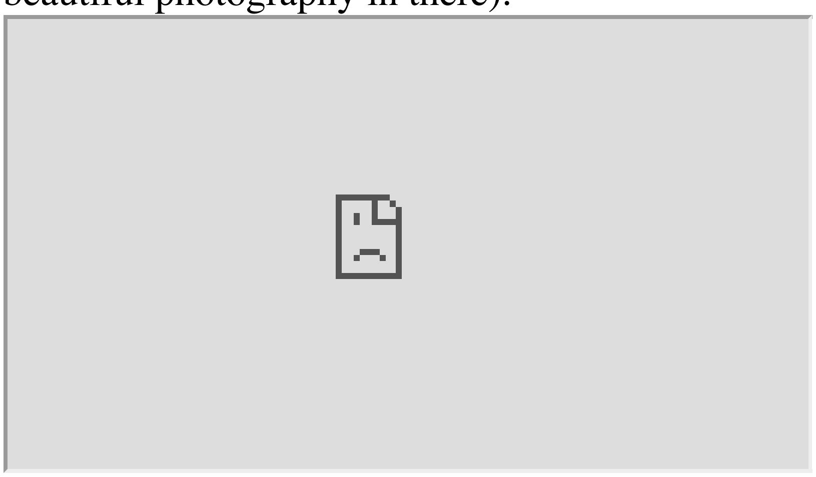
I look for a bike in any of the overlapping categories "city", "commuter", "hybrid", or "road". I want something with a MSRP in the US of at least $500, indicating a reasonable level of component and frame quality. And at that point, I just sort by features and price.

Case study 1: My current "city bike", a K2 Astral 3.0, was purchased new in 2008. It was an end-of-the-model closeout at Nashbar, so the price had dropped from $580 to $300. Yet the bike is lightweight, stiff, and solid as a rock. And with about 4000 km on the odometer so far (2486 miles), the distance from Los Angeles to Washington DC, it has needed virtually no maintenance at all – a few flat tube change-outs and regular chain lube. The benefits and cost savings provided by this bike over its four year lifespan to this point have been almost immeasurable – many times its purchase price already.

Case study 2: Mrs. Money Mustache is still riding her 2002 Schwinn Moab mountain bike. This was near the top of the Schwinn line back in its day, as the components are thoroughly kickass and it is as light as a feather. She bought it at full retail price from REI at the time – almost $900. But the bike has now served her through years of commuting to work, dozens of harsh mountain bike trips in locations from the Rockies to the Pacific, towing our son around town in bike trailers for the past five years, riding to and from the Crossfit gym for the past two, while racking up over 5,000 miles on its odometer. How much maintenance has she required for this virtual bike ride from our home in Colorado to somewhere near the tip of South America? … once again, virtually zero. Chain lube and inner tubes. The odd twist of the gearshift cable adjuster knobs to keep the shifts aligned. She's still rolling on the original set of cracked stock Michelin WildGripper knobby tires!

So the point is, while bike maintenance is fun and many bike shops provide free tune-ups for life, in reality you will find that a good bike does not demand too much from you. You simply hop on, and it rolls you quickly to your destination. One mile every six minutes for beginners, and a mile every three minutes once you have a swift bike and more seasoned legs. Factoring in the shortcuts, faster parking, and freedom from traffic jams, a bike is often faster than a car for getting around an urban or suburban area. Adding in additional considerations for cost, health, and the environment, it's simply the only reasonable way to get around.

The final word: a short inspirational video on what it feels like to be part of the Bike Culture (click the expand button once it's playing – there's some beautiful photography in there):



[How Bikes Make Cities Cool – Portland]() from [Kona Bikes]() on [Vimeo]().

A few reasonable bike choices from today's market (updated August 2019):

Schwinn DSB women's/step-through bike (full-featured with aluminum frame plus disc brakes for $240!)

Schwinn discover hybrid (a great cozy city bike including fenders and rack, aluminum, $289)

Schwinn Vantage F2 (fast and light/aerodynamic sturdy ultracommuter bike with higher-range components, very similar to the Fortified bike that I ride, at a still-bargain $600)

** the last two affiliate links, so this blog will benefit if you end up buying them. But it doesn't affect the price to you, and don't let it bias your decision – shop around and get the bike that's right for you. Just get a bike!*

Update: Here are 30 more reasons to heed Mr. Money Mustache's advice and start cycling your ass off.

And finally, if you REALLY like people telling you over and over that you must ride a bike, here's the Original MMM bicycle Article, and here's the Biking to the Grocery Store one.

Houses and Stocks are Going Up – Who Cares?

By Mr. Money Mustache

Wed, 09 May 2012 12:00:53 +0000

Well, there it goes again. The business cycle, that is.

I moved to the United States at the peak of the 1999 dot-com boom. At the time, high-tech companies were engaging in bidding wars over candidates, and home buyers in Colorado were racing to put in above-asking-price bids on any livable home that came to market.

By 2002, those same workers were being dumped back out of their cozy offices, and houses around here were sitting on the market by the dozen, the prices slowly falling while the sellers grimly looked out the front windows at the quiet streets.

In 2006, home prices were on fire again, companies were hiring, and the future was bright. Until 2008, when everything crashed so heartily that banks couldn’t even keep up with the avalanche of foreclosed mortgages that fell upon them.

And now here we are in 2012, and I’ve noticed that houses in my area have started getting snapped up again, at increasingly healthy prices, as the number of just-arrived-Subarus and Audis sporting California, New York, and Massachusetts license plates has rebounded to match the growth in high-salary jobs around here.

Every time a real estate transaction takes place anywhere in my area, I get an email with all the pictures and details, thanks to an automated system that Mrs. M. set up for me using her special Real Estate Agent powers.

In recent years, I've received plenty of "just listed" notices, but a much smaller number of "sold" ones. But in recent months, that has changed dramatically. Even some of the silliest homes, the ones where I said "Yeah, good luck selling that little shack at THAT price", have been selling in short order.

At first, I dismissed the sales as flukes. Then I dismissed the growing trend as a localized or short-term one. But today I read the yearly statistical summary of my city's real-estate market and saw that the same thing is happening citywide. The number of home sales is up about 30% over last year at this time, even while the amount of inventory is about 20% lower. This adds up to a very different feeling for sellers – offers come quickly, discounts are minimal, and new listings are naturally trying for higher prices after seeing the recent sales.

Similarly, the stock market has been on a bit of a tear since last summer, rising by about 13.6% since I pointed out the sale that they were having on them back in August (see the graph at the top of this article). The US stock indices as a whole are close to their all-time record levels. Those fancy net worth graphs in our Mint account are looking better than ever, because the higher stock prices make your retirement savings accounts look rosier.

Are we excited about these new developments? Have they made us richer?

In quite a departure from my attitude on these things when I was younger, I would say "No."

Let's look at the house first. When you own and live in a house, and the market value goes up, you suddenly have a higher net worth. Hooray! But your cost of living (i.e., the price of houses) has also risen by exactly the same amount. D'OH! So while you can gloat to any new arrivals to your neighborhood that you got your house cheaper than they did, your situation remains the same. The mortgage payments, the size of your kitchen, the bathroom tiles. All the same.

Now in the bad old days of the early 2000s, Mr. Money Mustache wasn't around to teach the people of this reality. So when house prices went up, people started extracting value from them in the form of huge lines of credit. These credit lines were then spent on absolutely comical things like vacations, cars, or general lifestyle inflation. At that point, the credit victims had the same kitchen size, the same bathroom tiles, the same back yard. But suddenly, a higher mortgage balance reflecting the fact that their cost of living had gone up – while the free equity that came with the neighborhood appreciation was not there to balance it! Even when borrowing home equity to renovate the house itself, these people were simply increasing their cost of living rather than building wealth.

So when is it GOOD that your house goes up in value? Only if you're planning to do one of these things while the value is still elevated:

- sell the house and move to a rental instead
- sell it and move to a less costly house in the same area
- sell it and move to a different real estate market (another city or country, which hopefully has not had the same elevation in prices)

You can also substitute "convert it to a rental house if rental rates have risen along with prices" instead of "sell it" in either of the last two cases.

That's it. Other than those situations, you don't care if your house price goes up. And you also don't care if it goes DOWN, even if you need to move, since other houses you might move to are also similarly discounted. (Unless you're stuck beneath an underwater mortgage – that can definitely put a damper on moving).

Some think of home price appreciation as a way to leapfrog to a bigger house. "Hey! I put no money down, but now I have $100,000 in equity! Let's use that as a downpayment on a $500,000 house!" . Those people would have been better off if the house prices had NOT appreciated, because in that case the bigger house would only cost $400k.

As for the downpayment: If you can't easily save up the 20% of a home's price, you can't afford that house yet. A house shouldn't be more than 2-3 times your salary. Even at a 50% savings rate, you've got your downpayment in about a year. If those numbers and ratios sound crazy to you, go back to the earlier MMM posts and start chopping expenses, or just buy a much smaller house!

Even for landlords, house price appreciation isn't so great. They've got a greater net worth, but the great deals have dried up from the market. Houses are now too expensive to make profitable rentals. The landlord still has his cashflow, but he should now consider if he would rather sell off the appreciated houses and invest elsewhere. Only if he does this, and ends up with a more valuable investment, does he come out ahead.

Ok, maybe house price appreciation isn't so great after all. But what about stocks? Everybody loves a rising stock market, right? I mean, daily movements in the stock market are all the financial news media ever talks about!

I used to watch my stock and retirement portfolio values like a hawk. Sure, I was a dim-witted hawk in retrospect, but at least my vision was sharp. At the end of a day with a huge stock rally, I'd bike home from work feeling very rich, eager to update my spreadsheets. After a crash, I'd feel poor and fret a little bit. You still read this on financial blogs to this day.. "My portfolio took a HUGE HIT today — OUCH!!"

Nowadays, I go months between noticing the value of the stock indices. Because I stopped caring about the **price** of the companies I own slices of. Now I only care about the **earnings**.

As true investors know, the point of owning anything is the stream of value that it provides to you over time. Farmland is useful because it produces crops. A personal residence is valuable because it provides a place to live – also known as 'imputed rent'. Rental properties are valuable because they provide rent checks every month. And shares in companies are valuable because they pay you a stream of dividends – as well as reinvesting some of their earnings in exchange for higher dividends in the future.

So the shares we own are only valuable because of the portion of company earnings they bring us. These earnings are unaffected by stock market swings, and only temporarily affected by economic cycles like booms and busts. The only thing that really matters is the overall productivity of the people who do the work for us – the employees of our companies. If the people continue to produce value, our companies will continue to produce earnings over the long run, and we as the owners will do fine. What we want as owners, is therefore to be able to get more of those shares at the lowest price possible.

That's a nice gross oversimplification of a very complicated subject, but it works for me. Unless you're a day-trader in stocks, long-term earnings are the only thing that will affect your lifetime income from owning productive assets.

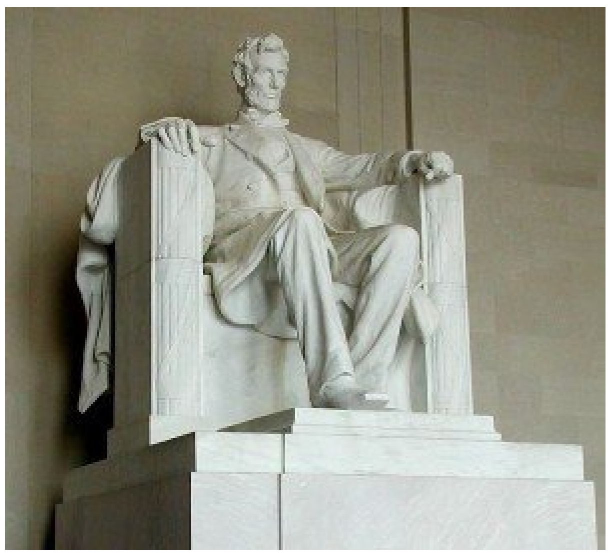
So rather than worrying about price fluctuations, I try to learn more about multi-decade trends in our society itself. I try to place my political votes not for who will try to bandage short-term issues like gas price spikes, but who will provide social stability, minimize depletion of the natural resources that serve as the basis for our productivity, and provide the lowest level of inefficiency-causing cronyism and corruption in the capitalist system over the long term.

And if the price of my own house rises too much, I'll sell it and get a nice place on the beach in Mexico instead.

Can We All Stop This Fucking Complaining About our Government?

By Mr. Money Mustache

Thu, 10 May 2012 15:32:31 +0000



"Obama knows nothing about economics. He's driving us into a hole"

"The Politicians are all sold to the highest bidder. It's all a ruse and I can't believe the voters think they have any say"

"Our whole economic system is a conspiracy, controlled by just a few elites who hold secret meetings. The US Federal Reserve is in on it. The rest of us are slaves to them and we are all so screwed."

BULLSHIT!!!

Reading comment like these, I feel like I'm alternately tuning into Fox News while dancing naked at a Tea Party rally, or reading George Orwell's 1984 while hiding in an underground cave. I've got a better solution for people who like to make statements like those above: try a little bit of OPTIMISM!!

I'm a new citizen of this great country. I sat in the big room with the flags and recited my oath with 99 other people from other countries just 410 days ago. Since then, I've been on a crash course reading books on US history and the politics of the past and present, as well as that of the rest of the developed world.

Want to know what I learned? The US political system is really not that bad. Want some more evidence? Go and learn a few things about OTHER COUNTRIES. Of course, most people never do this, because they don't show things like that on the television, but the information is out there waiting for you.

If our government was really that shitty, and the system really so rigged, would we really have such a free, open, and prosperous country when ranked among the over 200 other nations on Earth? True, we're not the very best, but we are still pretty fucking high up the scale.

Visit a national park and talk to the rangers, and notice their peaceful respect for the land. Those are government employees! Visit the atmospheric research center or NASA and talk to the scientists. They're brilliant, humble and valuable citizens acting out the will of the people – you and I. If you're really feeling bold, go commit a crime and get yourself arrested. Observe the treatment you get, and the trial and punishment. Then go commit the same crime in Iran and compare the results.

Learn about Afghanistan and Pakistan, Nigeria and Zimbabwe. Why are these places such a living hell? It's because their governments are FAR

MORE CORRUPT! Even Mexico, blessed with immediate proximity and free trade to the world's biggest economy, is absolutely crippled and dysfunctional compared to the country sitting just on the other US border: Canada.

All of these countries have the same species of being living in them. Their intelligence levels are very similar. The biggest difference: the quality of their governments!

The US government is made up of MOSTLY REASONABLY HONEST, REASONABLY COMPETENT public servants. There are a few assholes and a few power addicts, just as there are in any private company. This is a natural byproduct of the fact that the human race doesn't function perfectly in large groups (observe the history of tribal and later world wars). But you can get an idea of how well the government functions by looking at their work: the country.

I give the US, Canada, Europe, and Australia very high marks in good government. They're near the top of the world.

So please stop the fucking complaining and conspiracy theories. These guys are not as bad as you think. Read what the most honest among business leaders are saying about the politicians – these people actually have personal relationships with the president and congress. They're just like you and me.

I've noticed that politics and big business are almost like becoming financially independent and this blog. The majority of the country whines about how the odds are stacked against us and only the already-rich can get ahead because the world is not fair. If you ignore the complaints and conspiracy theories and just get to work, you can get as rich as you want. At this point, everyone will accuse you of lying and make excuses for why your story is not representative of real possibility in the world.

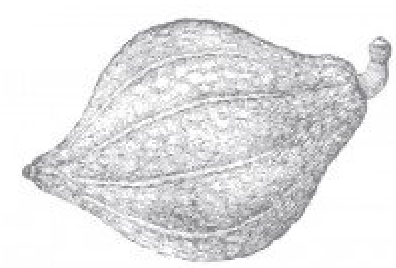
Similarly you (yes YOU!) can become a corporate CEO, you can have meetings with the president, you can BE the president, or you can work in government to try to help out with public policy. At this point, everyone beneath you will accuse you of being corrupt and being paid off by corporations and other bullshit that is true at the margins but very inaccurate when applied to government as a whole. Even if you're the best and most honest leader the world has ever known.

Life works better with **optimism**. Put that shit on your mirror and repeat it until you are no longer tempted to write shit like the complaints you see on yesterdays's post about house and stock prices.. or.. update.. some of the shit you see in today's comments as well. If you want change, go out and make it yourself. But focusing on what you want to DO, rather than how you don't like what others have DONE, is the only way to do it.

Food Rules – a Shortcut to Better Health

By Mr. Money Mustache

Fri, 11 May 2012 12:00:10 +0000



I used to assume that everyone over the age of twelve had figured out how to eat a healthy diet. Below that age, a kid can be forgiven, because fussy eating can be built right into your genes.

One year in elementary school I insisted that my lunch be only a bacon sandwich on a fresh onion bun, a container of jell-o brand pistachio pudding, a thermos full of chocolate milk, and an apple. And it was the only lunch I ate, day after day, for the entire school year.

Nowadays, my own son is unfortunately displaying the effects of his Dad's picky genes. Despite starting him out on a broad diet including Mexican, Indian and Thai food, he has now narrowed his menu to include only cheese, apples, milk, French toast, Dad's homemade bacon pizza, and a few types of fruits and berries.

Eventually I branched back out to become an omnivore who loves extreme variety, so I still have hope for him. But not everyone has such a bright future. I learned this when cleaning out the garage of one of my rental houses a few years back.

The tenant, a 21-year-old MBA student*, had moved out in a rush and left me with a line of ten (10!) oversized trash bags in the garage, plus a house full of junk as well. When moving the bags, I noticed clinking and rustling sounds which indicated recyclable materials mixed in with the trash.

If you've ever read the [Trash Article], you know that Mr. Money Mustache gets a little uneasy when confronted with the idea of sending unnecessary things to the landfill. It's one of my irrational weaknesses. So I put on some work gloves, and began to rip open the bags, and sort. And learn. And Holy Shit, you wouldn't believe what this 21-year-old had been eating and drinking!

There were pizza boxes, almost universally still filled with 25-50% of a dried-up pizza. When stacked, these pizza boxes towered taller than my head. Little sucka must have ordered a pizza for himself virtually every night of the week! And yet he didn't even have the foresight to save his leftovers in the 26 cubic foot stainless steel side-by-side fridge I had provided for him!

There were OVER A HUNDRED enormous 26-ounce paper cups from fast food "restaurants", some still partially filled with Coke and other toxic sugar drinks. But that wasn't all he drank – empty plastic pop bottles and empty cases of cheap canned beer were also in abundance.

Scraps of fast food along with their tragic disposable foam and paper containers filled some of the bags. Burgers, fries, chicken wings, and catfood-like taco bell "ground beef" remnants.

In the fridge were processed sandwich meats, processed cheese slices in plastic wrappers, half-finished TV dinners, and white bread.

By the time I sorted it all out, crushed it, recycled it, composted things that would rot and heaved the rest into a small dumpster, I was feeling pretty damned good about my own eating habits. I'm no angelic eater. I pig out occasionally, I've been known to consume all sorts of alcohol and various other drugs over the years, and I don't count food miles or insist on an all-organic diet. But compared to this guy, my diet looked like a buffet beamed down directly from the Food Gods.

I was also set to wondering about this country's populace as a whole. Do people really eat like this? Could this be the source of most of our early-onset physical and health problems? Was my renter's diet the reason he was frail and pudgy and frequently under the weather, despite being almost fifteen years younger than I was?

Maybe healthy eating isn't self-evident as I thought. Luckily, there's a pretty neat book I recently read on the subject. It's one of the shortest books you'll ever read, with just a few dozen pages and a few words on each page. It is called "Food Rules, an Eater's Manual", by Michael Pollan.

I figured this idea was worth sharing, because the book's recomendations align almost perfectly with some changes I've made to my own eating habits in just the past year or two. The results have been nothing short of dramatic to me. I've been trying to work out regularly and eat well for about 21 years now. But by switching to a less processed diet with more plants and delicious high-fat oily stuff, and just slightly away from things like bread and sugar, I very quickly lost about 15 pounds of fat without losing strength, leaving me with a leanness I had long ago written off as something that just wasn't in my genes. So, thanks Vegetables!

And here are my top ten quotes from the book, so you can get an idea if you are already a wise eater, or if you need a crash course on The Rules yourself.

1: Eat *food*

"These days this is easier said than done, especially when seventeen thousand new products show up in the supermarket each year, all vying for your food dollar. But most of these items don't deserve to be called food—I call them edible foodlike substances. They're highly processed concoctions designed by food scientists, consisting mostly of ingredients derived from corn and soy that no normal person keeps in the pantry, and they contain chemical additives with which the human body has not been long acquainted. Today much of the challenge of eating well comes down to choosing real food and avoiding these industrial novelties."

2: Avoid foods that have some form of sugar (or sweetener) listed among the top three ingredients.

3: Avoid foods you see advertised on television.

4: Shop the peripheries of the supermarket and stay out of the middle.

5: Don't ingest foods made in places where everyone is required to wear a surgical cap.

6: Eat mostly plants, especially leaves.

7: Treat meat as a flavoring or special occasion food.

8: Eat your colors.
"The idea that a healthy plate of food will feature several different colors is a good example of an old wives' tale about food that turns out to be good science too. The colors of many vegetables reflect the different antioxidant phytochemicals they contain—anthocyanins, polyphenols, flavonoids, carotenoids. Many of these chemicals help protect against chronic diseases, but each in a slightly different way, so the best protection comes from a diet containing as many different phytochemicals as possible."

9: Eat sweet foods as you find them in nature.
"In nature, sugars almost always come packaged with fiber, which slows their absorption and gives you a sense of satiety before you've ingested too many calories. That's why you're always better off eating the fruit rather than drinking its juice."

10: "The whiter the bread, the sooner you'll be dead."
Better yet, if you have any need to lose weight, avoid bread entirely. I think of bread products these days as "weight gain squares" – I do eat them, but only when my weight is getting below my target zone.

11: Stop eating before you're full

12: Limit your snacks to unprocessed plant foods. (fruits, vegetables, nuts)

13: Cook your Own Food – as often as possible.

OK, that was the top thirteen, since I couldn't think of any more to chop to get it down to ten. It's a good book, and you should read it if you have anything in common with my old rental house tenant.

* don't worry, he doesn't read this blog or even know it exists

First Retire…Then Get Rich

By Mr. Money Mustache

Mon, 14 May 2012 12:00:02 +0000

If you've ever told a non-Mustachian about your plans to become a very early retiree, you've probably had to deal with a volley of skeptical questions.

> "How can you be sure you'll have enough money for such a long period?"
>
> "Why did you quit working so early, when you could have had hundreds of thousands more with just a few more years of work?"
>
> "Sure, you may enjoy a frugal lifestyle now, but what if your tastes change in the future? Or if you eventually have expensive medical needs? I wouldn't want to be locked out of a high-wealth lifestyle in my golden years, just because of a choice I make right now".

Questions like these make sense, and because they are genuine attempts to learn rather than just complainypants statements, they deserve real answers rather than just punches in the face. I got a lot of them after posting the article about how we saved for retirement in 9 years on two regular engineering salaries.

Although I will never lose my love for an efficient and simple lifestyle, I've actually got a secret plan to get quite a bit richer over the next 40 years. It's secret, because I don't want this blog to become one of those Big Income Big Spender (BIBS) blogs that everyone else writes. But it's not complicated – the trick is simply that I've been maintaining a **positive savings rate, even in retirement.**

To understand the implications of that, check out the following two examples:

Jack and Jill are two single MMM readers in their mid-20s. They are both planning to retire by 35, and each has determined that their his or her annual spending level is about $20,000 per year.

Jack follows the popular "4% withdrawal rate" guideline, and determines that he needs $500,000 in assets to fairly reliably generate that income for him for life. As soon as he hits the $500k mark, he quits his job.

From that point onwards, he resolves to devote all his efforts to charity or beach-sitting and never earn another dollar. He also decides to keep spending $20,000 per year whether he needs to or not. Just for fun, let's say the stock market conditions are worse than average throughout his retirement, so he slowly uses up his nest egg and when he dies at 108 years old, he spends his last few thousand dollars on a scholarship for his great-great-granddaughter. Not too bad a life story, but it was a close call, financially.

Jill has also estimated that she'll need $20,000 per year in retirement, so she also works and saves until she has $500,000. At that moment, she is financially independent just like Jack. And she has grown tired of her corporate job, so she's ready to hang up the keyboard. But like Mr. Money Mustache, she has a secret plan to end up much wealthier in her later years. How could this happen, even after retirement?

To find out, let's follow Jill after retirement to see how things go.

For the first year, she is in recovery mode from putting up with 15 years of corporate work. She spends her weekdays doing projects around the house and getting back into shape, her weekends visiting her still-working friends and family, and several weeks taking a few of the trips she had been postponing. Whew, that was great. The whole $20,000 budget was spent and she earned nothing. But by spending so much of her newfound free time socializing with friends, she learned of several interesting opportunities in her dream field of being a kayak instructor. A tour company was looking to hire guides, and some paddlers were looking for lessons. Someday, she might follow up on those.

By the second year, her house is nicely fixed up and the desire to travel has been somewhat fulfilled. And since she's an MMM reader, she is occasionally tickled with inspiration towards living a simpler and more efficient life. A few interesting ideas come up, and she tries them out:

The original $20,000 budget had assumed that she'd keep her fairly new Honda CR-V and drive it 10,000 miles per year at 25MPG. Now thanks to the Little Car article, she realizes that a Toyota Yaris is more than big enough for her, allowing her to cash out about $4000 of capital. And with some moderate hypermiling techniques, she gets over 40MPG. Also, she has started riding her bike more, reducing annual mileage. Driving costs have dropped by $2,000 per year, or 10% of her pre-retirement budget estimate.

She also decides to quit her gym membership and join a rotating workout-with-friends circle instead, loses some of her taste for gadgets or perhaps another of her more expensive hobbies the next year, and realizes that all around, she now lives on $15,000 per year.

Meanwhile, the simpler lifestyle proves energizing and frees up time. She starts kayaking more, and teaching lessons on the side. This turns into a regular class she offers through the local community college, which brings in $1250 every time she runs it. To avoid feeling like it's a real job, she does only four sessions per year, bringing in $5000 (and netting her a nice tax deduction for any kayak equipment as well).

One day, one of her kayak students is a guy named Jack. He's a handsome early retiree who has a lot in common with her. As luck would have it, he's actually a closet MMM reader! Once they discover they have

Mustachianism in common, it is inevitable that they fall in love. Jack's solitary fate above has been changed, and now they live together, and eventually end up married with combined finances. (Don't worry, when two Mustachians live together, the joining of finances is far from a source of potential relationship friction, it's more of an aphrodisiac)

Paired up, they are able to share one house and car. Despite traveling much more together, their yearly expenses drop to $30,000, while they still have passive income of $40,000. On top of that, Jack rents out his old house for a $5,000 per year net profit, plus there's Jill's teaching income. $50,000 per year. That leaves a savings of $20,000 to be re-invested annually.

Over time, this $20,000 stream accumulates and compounds at 5% after inflation, and raises their combined net worth by **an additional $1.329 million over the next 30 years**. This is on top of the $1 million they already had, automatically growing with inflation while also pouring out $40,000 towards their living expenses each year that also adjusts with inflation. They end up with a total 'stash of **$2.329 million** by age 65 or so, just in time to start enjoying the additional (but totally unnecessary) boost of Medicare and Social Security benefits.

It's a fully fictitious example, of course, but it's not a far-fetched one. I've already told my own story many times of retiring, but then ending up finding I needed less to live on than previously estimated (we originally expected to spend $32,000 per year). Then we both ended up working part-time during various intervals, and will probably take on even bigger projects when our boy grows up.

Since retirement in late 2005, we've still ended up saving even more than the $20,000 per year described in the example above, meaning we're on track to have *several million* extra dollars saved by age 65. If you do your own retirement planning with a reasonable safety margin built in, making conservative assumptions on both the income and expense side, the same thing is very likely to happen to you too.

But you don't have to be insanely conservative, working for year after year to ensure a gigantic starting nest egg before daring to retire. I don't know a huge number of early retirees, but the ones I do know have always found that:

- expenses drop more rapidly than expected after retiring, and continue to fall through the years.
- income ends up being larger than zero, even though your conservative estimates didn't depend on this bonus.

Once you quit a full-time job, you just need a small positive savings rate to stick around and keep trickling into investments. This will automatically become a cash snowball as you go about your daily retired life. By the time you're old enough to need it, it will be bigger than you can possibly need.

So don't think of the date of your Early Retirement as "The last dollar you'll ever earn". It's just the First day of the rest of your life!

Internet Sharing – How to Get Revenge on the Cable Company

By Mr. Money Mustache

Wed, 16 May 2012 12:00:25 +0000

Earlier this spring, reports started coming in from some nearby friends that their internet access prices had been jacked way up. It seems that the local internet near-monopoly (Comcast) had just arbitrarily decided to increase their prices by $10 per month. Offended by this attack on their frugality, these friends naturally turned to Mr. Money Mustache for advice.

Normally, I'd just advise them to use the magic of the free market and vote with their feet. Call Comcast, cancel the internet service while explaining it is because of the price increase, and select one of several other options we have here in my town (including a city-wide wi-fi network).

But in this case, hearing of this the 20% price increase pushed me over the edge. You see, I've had a bone to pick with Comcast ever since 2009, when they secretly funded a voter disinformation program called "No Blank Check Longmont". It was designed to get the citizens of this city to vote *against* allowing our town council to use the fiber-optic network that the people paid for and own, to offer services for the benefit of the people.

The cable company was afraid of having to compete with a potentially low-cost internet access program from the city, but since that wouldn't make a very good sales pitch, they did it by lying instead: saying that the city would be spending taxpayer money on the project. It was completely false, and the town council tried their best to fight the lies with editorials in the town newspaper. But in the end, Comcast just out-spent the council by a huge margin and stupidity won the day. In 2011, the fiber optic vote came back on the ballot, and Comcast funded *yet another* disinformation campaign with the catchy name "Look before we Leap". Again, they pretended to be "a group of concerned citizens" despite the fact that their entire $300,000 budget came from the cable companies. Luckily, there were enough informed voters the second time around to kick its ass. The citizens got their fiber optic network back, and Comcast gained a few new lifetime enemies, including me.

So with that in mind, today's article details a fun science project that is purely for informational purposes. If this article becomes popular someday in the future, it may help tilt the balance of power (and the flow of monthly fees) away from the big cable companies and back into the hands of computer-savvy people like you and me.

My friends and I wondered, "If several people all live close together, is it theoretically possible to share a single internet connection, linking multiple homes with long-range wi-fi antennas?"

We all know about wi-fi technology. I've been a big fan since it first popped up at the turn of this century, and suddenly laptop computers truly became useful since you could work in a cozy chair without the need to string a network cable across your house. Since then, we've gone from 802.11b all the way up to 802.11n, and its speed has gotten about 30 times faster as the price has dropped like a stone. But even now, these technologies are designed with limited range. They can nicely blanket a coffee shop, your house, and even your yard with internet access. But if you walk down the street, you'll see the signal strength drop off rapidly and you'll be disconnected within a minute's walk.

But for this article, we decided to see how far the envelope could be pushed. In my neighborhood, there are quite a few friends within a three minute walk, which works out to about a 900 foot radius when plotted on a map. Specifically, there's a cluster of nice people directly to the Southwest of me, so we decided to see if we could bring up a reliable high-speed wi-fi connection between my house and theirs. It was a struggle, but feeling the eyes of the Mustachians on me, I could not give up. In the end, we prevailed, and learned a lot in the process. Here's how I did it:

Step 1: I measured the "as the crow flies" distance between the two houses. I used this handy google maps distance calculator for that step. If your line of sight between houses is obscured by trees, the limit is 1000 feet (about 16 houses worth in a medium-density housing development) . If not, you can shoot for 2000 feet or more.

Step 2: I ordered two long-range wi-fi outdoor access points from amazon. These have a relatively strong 13dbi internal antenna and a power output of 500 milliwatts – apparently the highest legal power output in most countries including the US.

Step 3: Each homeowner found a way to string an Ethernet cable from his roof, through the attic and nicely into his office to be plugged into the existing wi-fi router on each side.

Step 4: The access points arrived and were installed upon the rooftops, pointing exactly at each other through the 900 feet of clear air with occasional tree canopies.

Step 5: Extensive fussing around with network settings on both sides ensued, due to the clunky user interfaces and loosely-translated-from-Chinese instruction manuals. In the end, we succeeded in getting both houses to share the single internet connection.

Update 2016: when I first wrote this article, the available wi-fi access points were not as effective as they are today. But I have updated the link above to point you to the latest technology, which is of course even cheaper than before. The next paragraphs describe an external antenna I added to the older access point to get greater range. You probably won't need this, but read on…

But the result was not satisfactory. My house has a very fast internet connection (over 10 megabits/sec download speed), yet my friend was unable to get downloads faster than about 1.0 Mbit/sec, and frequently dropped below half of that. This is too slow to watch Netflix movies or even YouTube, so we were disappointed.

I fiddled some more. We tried returning one of the access points to Amazon, thinking it was defective, but the replacement was exactly the same. I brought them both to my house and did some close-range testing and found that the throughput was much faster at close range. That meant that the distance, and especially the trees, were weakening the signal.

We could give up, or we could double down. Since this was an official Money Mustache Laboratories experiment, I decided to Double Down.

So the Laboratory purchased an upgraded antenna for one end of the connection, to really beam that signal with maximum intensity. I found an external "24 dbi" antenna and a connector cable, both from the same TP-link company, and placed the order. Based on the picture and the price, I was expecting a cute little flimsy metal thing about the size of a small toaster oven. But when the big flat box came to my house, I was shocked at the size.

I opened the box, and saw a beefy metal grid that looked like a BBQ grilling surface. It was huge! But there appeared to be TWO of them in the box.
"Did they accidentally send me two antennas?", I asked.
"Uhh.. I think you're supposed to bolt both of those pieces together", came Mrs. Money Mustache's voice from over my shoulder.
She was right. I assembled the 24dbi monstrosity, and this is how big it ended up:

RF engineers will note right away that in this picture, I had the shiny receiver part in the center mounted sideways – it needs to be rotated 90 degrees. But I didn’t realize that until several hours later. After climbing back onto my roof, connecting the external antenna, and fiddling yet again with angles and orientations, I couldn’t even get a signal as strong as the smaller internal antenna had been delivering (for reference, I found you need at least 36 db signal strength to get a fast connection – the internal antennas averaged 28 db).

So I gave up and sulked down my ladder, thinking that the experiment had been a failure. I’d have to return all this stuff and probably wouldn’t even bother writing this article. But as I opened the box to get it ready for re-packing, a figure in the instruction manual caught my eye. I realized I had installed the receiver wrong! There was still hope!

To make the rest of this long story short, I reassembled everything, put it back on the roof, and BLAM! The internet connection between the two houses was suddenly blazingly fast! My friend was able to get 10-megabit speeds through his test setup, and the connection was finally rock-solid – good enough to stream movies and music without stuttering.

The final solution. It's huge, but it is tucked away on a back corner of the Mustache residence, so the overall effect is no worse than a TV antenna.

It was a lot of work. Even after learning from my mistakes, I would not recommend this project for someone who doesn't know how to, for example, manually set the IP address of a computer, or how to change their wi-fi router so it assigns DHCP LAN addresses on the 192.168.2.x subnet. All of these details could easily be hidden from the user with the right technology, but it doesn't exist today – so this is not for technophobes.

But if that doesn't scare you off, here are the benefits:

- Sharing an internet connection with a friend can save each person $300 per year or more.
- Extending your home wi-fi network to include a big swath of your neighborhood allows you to make voice-over-internet phone calls even when not at home. This may allow you to use a lower-level mobile voice plan, data plan, or both.
- It allows you to share files, folders, and even printers between friends as if they were in the same house.
- My phone now connects to my home wi-fi network even when visiting neighbors many houses away. So I can stream my favorite Pandora Internet Radio through the phone, which is fun for parties and also for outdoor construction work, which I do mainly close to home.
- I got in touch with Republic Wireless and am now on their short list to become one of the testers. This is a new $20-per-month unlimited cell

phone plan that works best if you're in wi-fi range a lot of the time. With this new rooftop antenna system, this is definitely the case.
- This antenna/access point combination can also be used to tune into any nearby wi-fi network. There may be public wi-fi available at a library, school, or other facility (even several blocks away) that you can use from home, for free. For light users, this may allow foregoing a paid internet connection entirely. In my city, an outdoor access point is often required to connect to the city's pay-for-use wifi network. But once you have it set up, you benefit from great-quality internet access at a price much lower than what the bad guys are charging.

Disclaimer: if you plan to do this, check your own internet service rules to make sure it's allowed. Comcast, for example, tells you in the user agreement that sharing is not allowed (even though this is a silly rule: they already have a montly data limit, so who are they to say how you use the data YOU are paying for??). I'm not a Comcast customer (I switched to another service after the aforementioned hijacking of our town's elections). I don't encourage breaking any laws. I just encourage having fun. This post for is for educational purposes only :-)

Happy Hacking!

Update, 18 months later: *Voters have scored another body blow on the cable industry, approving a fiber optic connection to every interested home in the city, which will bring us 1,000 megabit/second internet for $49 per month: http://www.washingtonpost.com/blogs/the-switch/wp/2013/11/06/big-cable-helped-defeat-seattles-mayor-mcginn-but-they-couldnt-stop-this-colorado-project/*

Further notes on Comcast: *After reading many of the comments below, I realize just how widespread the dislike for this company is. It's quite amazing, and a bit reassuring, to see that running a company in an unethical way really does get you in trouble with your customers. Eventually, it will surely force the company to drastically improve, or be destroyed.*

The funny part is, I remember reading an interview in a big business magazine with the Comcast CEO a few years ago. He sounded all earnest, *like he really knew about their bad reputation, and he wanted to improve it.*

Well, here's a tip, besides the obvious of "don't try to hijack local elections". How about TELLING PEOPLE THE ACTUAL PRICES OF YOUR GODDAMNED SEVICE PLANS!?!? If you go to comcast.com and look up pricing plans, you get thrown into an awful and tricky maze. First of all, everything is all jumbled up, with talk of archaic services like "TV" and "Voice" even after you click the "Internet" tab.

Secondly, we do NOT give a shit what the fake price is "for the first six months". Tell us the actual goddamned price! Put the long-term monthly price of all the services on the FRONT PAGE of the website. In huge numbers. If you like, put a tiny footnote about any introductory pricing, which is almost irrelevant to our long-term costs. Better yet, skip the stupid gimmicks and roll the promotion into the overall price, lowering it slightly. Then raise this price about 2% per year at the most, to keep up with inflation. Or better yet, lower it, since communications and tech prices are always dropping. Be honest, and stop trying to fool people into buying more shit than they need.

These are my tips to Comcast as a starter for how to make your customers hate you less.

Embracing the Nagging Voices of Success

By Mr. Money Mustache

Mon, 21 May 2012 06:27:08 +0000

Do you ever feel like you completely suck at running your own life? Because I sure do.

As luck would have it, I'm at a bit of an apex of suckiness right now. It's Sunday night at 10:17PM, and I am behind on a whole bunch of stuff. I've got over 150 emails from the beloved Mustachians that may never get answered because they come in faster than I can write back. My back yard is full of power tools and wood because I'm right in the middle of building a huge fence around the yard. I didn't have time to clean it all up before it got dark, because I got sidetracked by drinking beer with friends and watching the solar eclipse. And now there's a chance of rain falling on all my stuff this evening. This blog has sat ignored since last Wednesday. I told the lady at the credit union that I'd send the paperwork to her for my new line of credit by tomorrow morning. And at the end of the night, I opened the fridge and realized I had completely failed to get groceries for the last few days and we're out of almost everything. I hit such a low point on the suck scale that I actually used the CAR for this emergency grocery run – the first time in many months.

At this point, many of you are surely saying,

> "Waah! Waah! Listen to the Whiny Retired Man describing the teeny-tiny hardships of his cushy life! Oh, please, get me a bucket for I am shedding so many tears that they are spoiling the finish on the Tiny Violin I am trying to play in sympathy for poor old Mr. Money Mustache!"

And you're right – there's no real problem with the day I described. You could re-write that first paragraph to sound like the most pleasant Sunday that has ever occurred.

The problem was that for the last four days, there has been a growing chorus of nagging voices in my head, telling me that I was falling behind on everything and I needed to work harder to catch up. (OK, not actual audible voices like you get with schizophrenia, but nagging *thoughts* that I like to call voices.) These voices are relentless, and the only time they let up is when I work hard enough to get ahead of the self-imposed tide of responsibilities. In fact, the reason I'm staying up all night to write to you, then get a whole bunch of other stuff done on this computer, is to silence those damned voices. So let me just grab a late-night snack and bring it up to my office, then we can figure it out together.

All right, I'm back.

I'm going to wager that a lot of this talk of the nagging voices sounds familiar to you. I've told a few people about them in real life, and most of them said, "Hey! That's exactly how I feel most of the time! I thought I was the only one!". And after talking it over with enough people, thinking about it, and enduring the nagging for a large enough number of years, I came to realize something that has been a great revelation and relief to me, and perhaps to you too:

That constant nagging is not a sign that you suck. Quite the opposite, It's a sign that you're going somewhere. Those are **the Nagging Voices of Success!** So one of the secrets of a happier life is actually learning to appreciate and even embrace their occasionally bitchy whines.

It may sound far-fetched, until you consider how I came to this conclusion. I've endured the NVS for many years. I think they started in elementary school, when the concept of getting good grades and doing your homework was introduced. From that point onward, there was always something I *could* or *should* be doing. Any time spent *not* doing those optimal activities was technically slacking off. And whenever I was slacking off, inner nagging would ensue.

I found there were ways to game the system a little. While I was actually working hard, the voices were silent. By building up a cushion or buffer of hard work, I could even take a short break without experiencing nagging. But the NVS would always return. Another trick I learned was that by scheduling my time out in advance, to include plenty of work, but also a fair amount of play, I could trick them, since they would focus on the Work entries in my calendar while I snuck away to play. But then I would invariably deviate from my calendar and start freestyling at life again, and guess who I'd find rolling up right next to me on a skateboard, full of helpful hints? That's right, the Nagging Voices of Success.

Through all those years, I was looking at it the wrong way – I thought that the voices were there because I really sucked and really was always behind on everything. But eventually, after far too long, I started to notice that I was actually pretty far ahead, when measured against an average person of my age. Which is not to say that I thought I was an unusually good or worthwhile person in any way. But just in the raw measurement of "Amount Of Shit Completed Thus Far", evidence was starting to amass that I had been getting a larger than average amount of shit done. It was showing up in the form of career progression, money and material things accumulation, and innumerable projects being completed here and there around my house. Everywhere I looked, I would see something that I had spent quite a few hours on. This blog's almost a thousand. The fence will be yet another 80. In short, all the things that I supposedly sucked at and was always being nagged about. If all this shit really was getting done at a good rate, then what was the problem? Why the nagging?

This led to a revelation: Those nagging voices aren't a measure of your lack of self-worth or accomplishment. They are an indispensable component of a successful person! (Here we're again narrowly defining "success" as getting a lot of shit done, sometimes leading to monetary wealth). If you didn't have the nagging voices, you wouldn't ever be compelled to do any of the more difficult things in life, and thus you'd never get anywhere.

Before realizing this, the only way to be happy is to be working away busily on something. It's hard to enjoy rest. But once you realize their true intent, you can finally make friends with the voices, and just be thankful for them. They'll still creep in and make you stay up late occasionally, as they're doing to me right now. But it becomes a good kind of mutual understanding. I know that life is better when we have a balance of work and play, since challenge and hardship are key ingredients to happiness. But befriending the NVS may allow workaholics to shift the balance at least a few notches away from the "work" setting.

As a final parallel, you may have also started getting visits from the Nagging Voices of Frugality. These are the voices that question every single purchase you ever consider making. They remind you that there is Always an even better purpose for every dollar you get your hands on, and therefore they occasionally take the fun out of things that really should be splurged upon. You can fight the NVFs, or you can befriend and thank them. These little friends will ensure that you never get yourself into financial trouble for the rest of your life, and in combination with the NVS will virtually guarantee great riches eventually. Your challenge is then just learning when to pinch their beaks closed long enough to enjoy an ice cream cone or even a nice hotel from time to time, while allowing their natural power to guide you the rest of the time.

Embrace the nagging voices and prosper.

Happy Monday!

Mrs. Money Mustache: Routine Will Oil the Machine

By Mr. Money Mustache

Thu, 24 May 2012 12:00:26 +0000

Embracing the Nagging Voices of Success" and thought: Yup, that definitely describes The Mustache, but it doesn't describe me.

MMM and I have completely opposing brains. We often joke about this and I think it is one of the reasons we get along so well. It's interesting to be with someone whose brain functions so differently, because it brings a completely new dimension to your life. My Mustachioed Husband has always been extremely self-motivated. This is a rare and awesome trait and it's great to be around someone that is so positive and energetic all the time — that energy rubs off on me and can lead to great things.

But, being with someone like this can also make you feel like a Lazy Log. You see, I am someone that is highly motivated by *external* influences. In the workplace, I make a great employee because I will never let an employer or client down. I will work extremely hard for other people, but I don't always work hard for myself. I will sacrifice my own happiness for the happiness of others.

In my non-work life, I can sit and think about nothing for a long time. My mind tends to focus on the moment rather than always straying off to think about other things. In fact, it is so hard to sort through a problem in my head that I've kept a diary since second grade in order to figure out how I'm feeling about life.

There are many advantages to this. I can clean a house approximately twice as fast as MMM because I do it with extreme focus and intensity rather than getting distracted. I can travel anywhere in the world and feel perfectly comfortable in my surroundings. I don't feel like I have to get things done all the time in order to feel happy. I love being alone.

But this can also lead to problems. I often require external influences to get my butt into gear. I clean the house only when people are coming over, I exercise only if I'm signed up for a class, I work on projects mainly when they are assigned to me by others, and I finish books only because I'm in a book club. I eat when I realize I'm very hungry (which leads me to end up eating plain raw foods, since I'm usually too hungry to cook anything).

I can waste vast amounts of time, if given the chance. I do not have these voices inside my head telling me to get things done. I actually have to create lists of things to get done, otherwise nothing will happen.

But, this article is not about me. This is about you. The point is, during your working career, you have built-in motivation. You have to get up every morning and go to work or you won't get paid. There is a routine to your day and you follow it and you feel like you accomplished something each day. If you're lucky, maybe you get a few other things done in the evenings and on weekends.

When you stop working, that goes away. For those of us who aren't super self-motivated like Mr. Money Mustache, you might end up feeling a little lost. I know I did and I still do sometimes. But, this is where the fun begins. This is the Exciting Challenge in the New Chapter of your Life!! Embrace it, because you will learn more about yourself during this time than any other time in your life. You get to figure out what is really valuable to you. You get to find out who you are.

It can take a while – it can even take a lifetime, but it is very enlightening. My personal tactic is to write things down so I can figure it out as I go. Looking back on your own writing, you can read what you wrote in the past from a completely different perspective. You can actually see things in your writing that you didn't realize were there and you can give the Past You some advice. It's pretty cool stuff.

What makes you happy when you don't have any external influence like work in your life? Isn't that a question worth answering? I have a child, which is a huge responsibility that motivates me to no end, so I still don't have the complete freedom one would have with a full traditional retirement. But, there's still a lot of time to fill in during the day when he's at school. And when you have a kid, you also realize that you really need to take good care of yourself and your needs in order to be a happy and successful role model.

Develop a Routine. The answer for me (and perhaps you too) is Routine. You need to create a routine for yourself, but you decide what it is depending on who you are. Don't follow someone else's routine. You can use others as an example, but different things work for different types of people.

For example, I know that if I start using my computer first thing in the morning, I am screwed and I will be on this thing all day long. So, as soon as MMM bikes off to school with our son, I have a routine: I clean up around the house until he gets back. Then I'll do a round of the gardens outside, weeding and watering and soaking up some nature. This will lead to noticing other things that need doing around the house – incoming mail that needs processing, things that need fixing. The routine causes all of this useful stuff to happen, and without it I would have been just sitting around checking e-mail and perhaps even Facebook (gasp!).

Attack your weaknesses. My weakness is wasting time on my computer. I was able to attack my prior Facebook problem by disabling my account for 2 months. When I went back, I was basically cured. I no longer felt the need to check it every day and make sure I congratulate everyone with new babies and sympathize with those who had a loss. The only reason I went back was to connect with family members that I had no other way of getting in touch with. My time without Facebook was Excellent.

Find out what Motivates you. Since I have come to terms with the fact that I am motivated by external factors, I have increased my happiness in several ways. I have conquered my exercise avoidance by joining a local Crossfit gym. In contrast, MMM doesn't need a gym to motivate himself to exercise. I thought I could also work out at home, but this doesn't work very well for me. The reason Crossfit works for me is because I love the community, I love the workouts, and I love the competition. A regular gym didn't work for me. This doesn't mean you have to pay to get your motivation though.

I found other ways to motivate myself before I ever paid to work out. For example, one year I organized a Weekly Hiking Club. But it wasn't a normal hiking club. It was a Points-Based hiking club with results posted online. Every week, I would organize a hike and assign points for meeting certain goals and create a fancy web page with pictures and a tally of all points. You might get 10 points for the hike itself and 10 more points for biking to the hiking meetup spot instead of driving. Many friends got involved and it was a great time. Creating some competition really motivated people to come out so they could earn their points and try to win.

Set goals for Yourself. In order to get things done that you enjoy, you might need to set goals for yourself. One goal that many Mustachians can relate to is biking to work. Setting a goal to bike to work a certain number of days per week and somehow being accountable (maybe tell your coworkers or bike with someone) can be very motivating. I used to bike to work (8.5 miles each way, three times a week) and it ended up being the best part of my whole day. The pre-determined schedule forced me to do something great several times a week.

Embrace these new challenges instead of shying away from them. The type of person who is worried about what they'll do when they stop working, is probably the type who will benefit most from leaving the old routine of the job and being forced to figure out what is really worth doing!

Guest Posting: Financial Independence … 23 Years Later

By Mr. Money Mustache

Sat, 26 May 2012 12:00:48 +0000

Foreword by Mr. Money Mustache:

A few months ago, a new reader showed up at this blog and joined the conversation in the comments sections of the articles. It was a guy named Jim Collins. He was wise, funny, well-spoken, and skilled in the use of swearing. So I checked out his blog and learned more. It turns out he's older than me (around 61 apparently), has had a long and interesting career in positions ranging from Tree Trimmer to Fancy Businessman and beyond.. and has been financially independent since around 1989.

Since that's approximately the year I learned to drive a car, I figured this man would have quite a deep perspective on what life is like when you are not driven solely by the need to earn a paycheck. So I asked him if he'd be interested in sharing that perspective with us as a guest posting. "What has life been like since then? How do you fund your daily expenses, how has the health insurance situation worked out, what do financial crashes feel like, and what is your overall advice for those reaching financial independence and/or early retirement?"

The following story is what he sent me in response:

It has Never Been About Retirement

For me it has never been about retirement.

I like working and I’ve enjoyed my career.

It’s been about having options. It’s been about being able to say “no.”

It’s been about having F-You Money.

It’s never been about this.
(Although, now that I’m 61 it’s getting closer.)

I started working when I was 13, even earlier if you count selling flyswatters door-to-door and collecting pop bottles from the side of the road for the deposits. For the most part I’ve enjoyed work and I’ve always loved being paid.

From the beginning I was a natural saver. Watching my stash grow was intoxicating. I’ve never been sure how this started. Might be hardwired into my genes. It might be my mother seducing me with the image of the red convertible I’d be able to buy when I turned 16. But that was not to be.

My father’s health failed and shortly there after so did his business. My savings went to pay for college and I learned it is a fiscally insecure world. Convertibles came later. To this day it stuns me to read about some middle-aged guy laid off from his job and almost instantly broke. How does anyone let that happen? Of course I know it is common, but still….

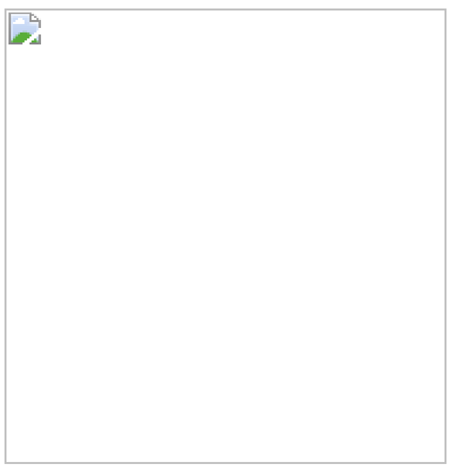
So, long before I heard the term, I knew I wanted F-You Money. If memory serves, it comes from James Clavell. In his novel “Tai Pan” (highly recommended BTW) a young woman is on the quest to secure 10 million dollars. She calls it her “Fuck You Money.” And 10m is far more than it takes, at least for me. But it put a face to the goal.

The other thing I quickly figured out is that financial independence is at least as much about being able to live modestly as it is about cash. Here’s my favorite parable:

Two close boyhood friends grow up and go their separate ways. One becomes a humble monk, the other a rich and powerful minister to the king. Years later they meet. As they catch up, the minister (in his fine robes) takes pity on the thin, shabby monk. Seeking to help, he says:

“You know, if you could learn to cater to the king you wouldn’t have to live on rice and beans.”

To which the monk replies:



“If you could learn to live on rice and beans you wouldn’t have to cater to the king.”

Most all of us fall somewhere between the two. As for me, it is better to be closer to the monk.

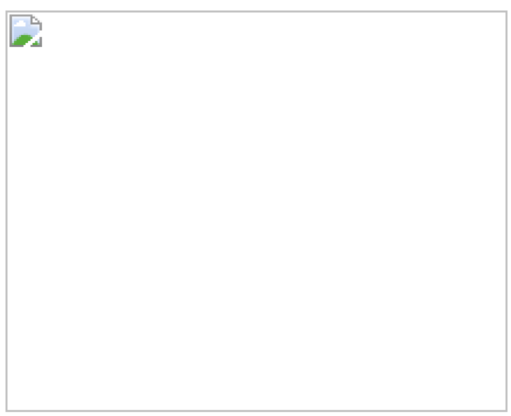
Enough F-You Money isn't necessarily enough to live on for the rest of your life. Sometimes it's only just enough to step to the side for awhile. I first had mine at age 25 when I'd managed to save the princely sum of $5000. This after working two years at 10k per year.

It was my first "professional" job and it had taken me two long post-college years supporting myself doing minimum-wage grunt work to find it. But I wanted to travel. I wanted to spend a few months bumming around Europe. I went to my boss and asked for four months of unpaid leave. Such a thing was unheard of in those days. He said "no."

Back then, I had no idea that working relationships were negotiable. You asked. Your employer decided and answered. Done.

I went home and spent a week or so thinking about it. In the end, as much as I liked the job and as tough as I assumed finding another would be, I resigned. I wanted to go to Europe. Then a funny thing happened. My boss said, "Don't do anything rash. Let me talk to the owner."

When the dust settled we agreed on a six-week leave



(which I spent riding my bicycle around Ireland and Wales)

and a month of annual vacation going forward. That got me to Greece the following year. My eyes were opened. F-You Money not only paid for the trip, it bought me room to negotiate. I'd never be a slave again.

Since then I've quit jobs four more times and have been kicked to the curb once. Blame my short attention span. I've sat on the sidelines for as little as three months and for as long as five years. I've done it to change careers, to focus on buying a business, to travel and, the time it wasn't my call, with no plan at all. I did it again just last year at age 60 and the intention is to remain retired. But who knows? I do like getting paid….

My daughter was born during one of these, ahem, unpaid leaves. These things happen when you've time on your hands.

Now 20, she has grown up with dad sometimes working 18 hour days and constantly away from home, to dad sleeping late and lounging around. But she always knew I was doing, for the most part, exactly what I wanted to do at the time.

When she was in first grade I went to a parent-teacher conference. My wife introduced me and the teacher said, "Oh! Mr. Collins. How nice to finally meet you. You're the father who's never home." A period of lots of business travel.

But then shortly after 9/11 my company kicked me to the curb.

Six months earlier our division president had taken me to a congratulatory lunch for a record-breaking year. We were explosively growing and embarrassingly profitable. Over a bottle of fine wine we discussed my very bright future. It was the best job I've ever had. Great team, great leadership, great fun. Great money. I had just cashed a bonus check for more than I had ever made in a single year before.

A year later my little girl and I were sitting on the couch watching a news broadcast. The concerned news crew was filming people standing in a depression era style bread line. They were, the reporter said breathlessly, the newly poor suffering from job loss in the dismal economy. I was still unemployed and licking my wounds.

“Daddy,” said my little girl, “are we poor?”

She was gravely concerned.

“No,” I said, “we’re just fine.”

“But you don’t have a job,” she said. Thinking, I’m sure, just like those poor souls on the TV. It was, as they say, a teachable moment on the power of and need for F-You Money.

I like to think these experiences have taught our daughter the value of having money and the joy of work when you aren’t effectively a slave to it.

When she was about two her mom went back to school. It was during my business buying phase and I had lots of free time.

While mom was off evenings at school, little girl and I spent endless hours playing and watching The Lion King over and over. And over. I’ve probably seen that movie more times than all other movies combined. We still laugh remembering the tea-cup towers we built. These hours were the foundation of the relationship we’ve grown to cherish.

Even though I didn’t have a paycheck coming in, around then we also decided my wife should quit her job to become a stay-at-home mom. This was a very tough call for her. Like me, she’d been working since childhood and loved it. But the problem was mostly, without a job, she felt she wouldn’t be contributing. I was failing to convince her until I hit upon this:

“We have F-You Money,” I said. “We don’t care about fancy cars or a bigger house. If you kept working what could we possibly buy with the money that would have more value than your being home with our daughter?”

Far and away the best “purchase” we ever made, and we never looked back. So we had no working income. For those three years our net worth actually grew.

As for me, I failed in finding a business to buy. But the search morphed into consulting work and a couple of years into that a client hired me for more money than I’d been making at the job I’d left years earlier. Such is the price of failure in the USA. As Leo Burnett once said:

"If you reach for a star, you might not get one. But you won't come up with a hand full of mud either."

When we moved to New Hampshire my wife started volunteering in our daughter's grammar school library. Their hours, of course, matched perfectly. After a couple of years they offered her a paid gig. It's not the corporate job she'd been used to but it's also stress-free and fun. She's never looked back.

For the most part over the years we've been married (June 19th is our 30th anniversary) least one of us was working. That handily solved the tough problem of health insurance. During the early 1990s, when we had an over lapping employer-less few years, we bought a high deductible catastrophic health plan. It is too long ago to remember the details and they likely wouldn't apply today anyway. But that's what we'll seek out if and when my wife decides to hang it up before we hit 65 and Medicare. For now she loves her school district job and the time off it gives her for our traveling.

On my own blog I've outlined what we own and why we own it so I won't bore anyone here. If you check you'll see it is the soul of simplicity. Three Index Funds and some cash.

You'll also see I'm not a fan of the "multiple income stream" school of investing. Simple is, in my book, better. So no cattle, gold, annuities, royalties and the like.

My small pension from the one company where I worked long enough to qualify I took as a lump sum and rolled it into my IRA.

There are also a couple of leftover investments from earlier times. We're burning those up as we need the cash. These represent the last remnants of the many investing mistakes I've made over the years. Most revolved around the idea that I could pick investments that would outperform the basic stock index. It took me far too long to accept just how vanishingly difficult a task that is. Three things saved us:

1. Our unwavering 50% savings rate.

2. Avoiding debt. I've never even had a car payment.

3. Finally embracing the indexing lessons Jack Bogle perfected 40 years ago.

Looking back what is striking to me is how many mistakes I've made along the way and yet those three simple things got us there. That should be encouraging to anyone out there who has made poor choices along the way and who is ready to change.

What a wonderful advantage a blog like Mr. Money Mustache provides. Set aside the specifics, just knowing that financial independence is possible short of winning the lottery is huge.

When my journey began I knew no one who was making the choices we made. I had no idea where it would or could lead. I had no one to tell me stock picking was a sucker's game or, more importantly, that swinging for the fences isn't needed to reach FI. That last alone would have saved me the $50,000 of my money Mariah International (a gold mining penny stock) burned thru while failing; and failing to make me rich.

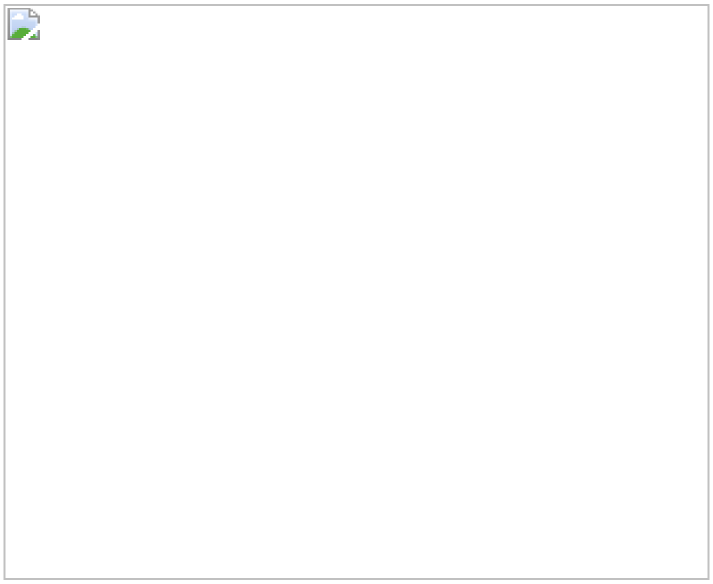
So now I'm (again) retired and it feels great. I love not having to keep regular hours. I can stay up till 4 am and sleep till noon. Or I can get up at 4:30 and watch the sun rise. I can ride my motorbike any time the weather or my pals beckon. I can hang around New Hampshire or disappear for months at a time to South America. I post on my blog when the spirit moves me and I might even get the book I've always wanted to write finally done. Or I can just sit on the porch with a cup of coffee and read the books others have written.

One of my very few regrets is that I spent far too much time worrying about how things might work out. What a waste, but it is a bit hardwired into me. Don't do it. Instead, live on less than you earn, invest the difference and avoid debt. Do just these three things and you almost can't help but succeed.

But what if disaster strikes? My biggest fear these days, and this is evidently common, is a major health failure. That, of course, would derail everything. Moreover, if you live long enough it is inevitable. If accidents don't take us, we all eventually sicken and die. Circle of life. (See, watching The Lion King over and over sunk in.)

The older I get the more real that becomes. My response has been to increasingly hold each day precious. I've become steadily more relentless in purging from my life things, activities and people who no longer add value while seeking out and adding those that do.

Financial disasters are less concerning. We can always adjust our living standard and we are open to moving to far less expensive corners of the planet. We might just do that anyway. It's a big beautiful world out there. Money is a small part of it. But F-You money buys you the freedom, resources and time to explore it on your own terms. Retired or not.



Enjoy your journey.

The 4% Rule: The Easy Answer to “How Much Do I Need for Retirement?”

By Mr. Money Mustache

Tue, 29 May 2012 12:00:35 +0000

In the world of early retirees, we have a concept that goes by names like “The 4% rule”, or “The 4% Safe Withdrawal Rate”, or simply “The SWR.”

As with all things financial, it’s the subject of plenty of controversy, and we’ll get to that (and then punch it flat) later. But for now, for those new to the concept, let’s define the **Safe Withdrawal Rate:**

The Safe Withdrawal Rate is the maximum rate at which you can spend your retirement savings, such that you don’t run out in your lifetime.

That sounds nice and simple, but many people consider it an unpredictable thing to nail down.

After all, you don’t know what sort of rollercoaster rides the economy will take your retirement savings on, and you also don’t know what rate of inflation will persist through your lifetime. Will a box of eggs cost $6.00 a dozen when you’re 65, or will it be closer to $60? So how can we possibly know how much money we will need to live on in retirement?

The answers you get to this question vary widely.

Financial beginners (about 95% of the population) tend to randomly just throw out a number between 5-100 million dollars.

Financial advisers who aren’t Mustachians will tell you that it depends on your pre-retirement *income*, (with the implicit assumption that you are spending most of what you earn) and the end answer will be somewhere between 2 and 10 million.

Financial Independence enthusiasts will have the closest-to-correct answer: **Take your annual *spending*, and multiply it by somewhere between 20 and 30.** That’s your retirement number.

If you use the number 25, you're implicitly using a 4% Safe Withdrawal Rate, which is my own personal favorite number.

So where does this magic number come from?

At the most basic level, you can think of it like this: imagine you have your 'stash of retirement savings invested in stocks or other assets. They pay dividends and appreciate in price at a total rate of 7% per year, before inflation. Inflation eats 3% on average, leaving you with 4% to spend reliably, forever.

I can already hear a chorus of whines and rattling keyboards starting up, so let's qualify that statement. I admit it: that is the idealized and simplified version.

In reality, stocks go up and down every year, and so does inflation. Over a long multi-decade period like the gigantic retirement you and I will be enjoying, enormous things have happened in the past. The Great Depression. The World Wars, Vietnam, and the Cold War. The abandonment of the gold standard for US currency and years of 10%+ inflation and 20%+ interest rates. More recently, the great financial crash and a slicing in half of of real estate and stock values.

If you happened to retire in 1921 on a mostly-stock nest egg, you would have experienced an enormous stock run-up for the first eight years of your retirement. You'd be so rich by the time the 1929 crash and the Great Depression hit, that you'd barely notice the trouble in the streets from your rosewood-paneled tea room.

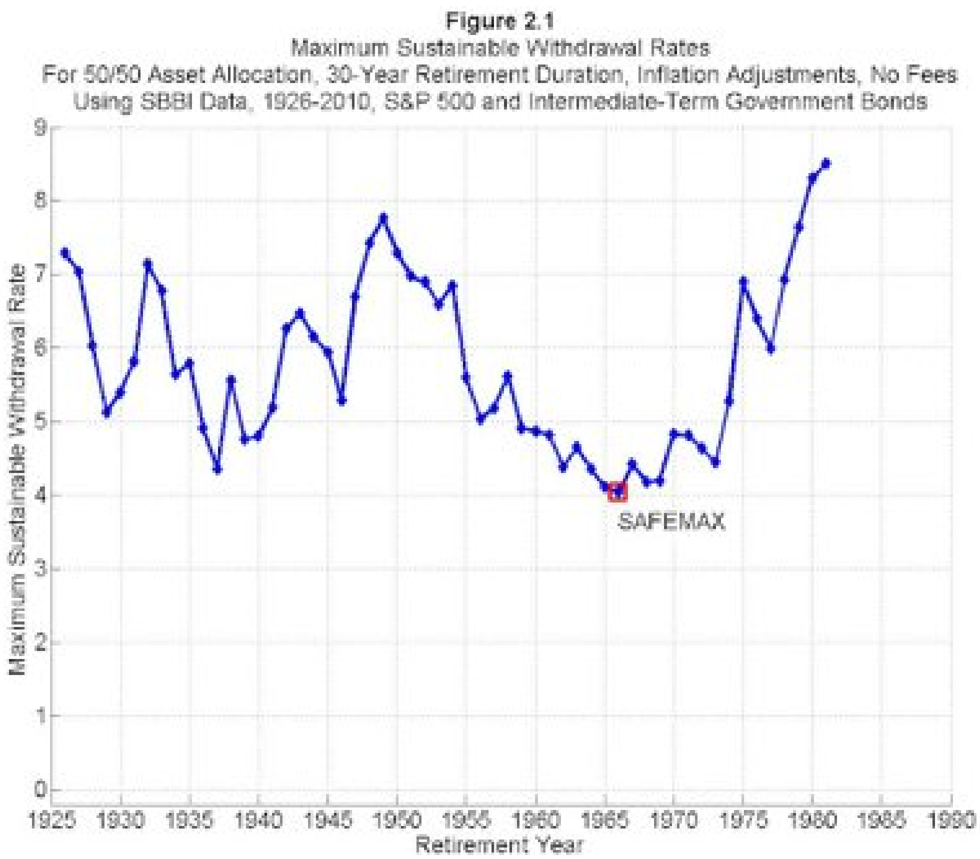
On the other hand, if you retired in early 2000 while holding stocks, you saw an immediate and huge drop in your savings along with low dividend yields – and your 'stash may be have had some scary times in the early days, and again around 2009. Would you still have any money left today?

In other words – the sequencing of booms and crashes matters. Ideally, you want to reach your magic retirement number in a time of nice, reasonable stock prices, just before the start of another long boom so that your retirement starts off on a good foot. But you can't predict these things in advance. So again, how do we find the right answer?

Luckily, various Early Retirement Ninjas have done the work for us. They analyzed what *would have happened* for a hypothetical person who spent 30 years in retirement between the years 1925-1955. then 1926-1956, 1927-1957, and so on.

They gave this imaginary retiree a mixture of 50% stocks and 50% 5-year US government bonds, a fairly sensible asset allocation. Then they forced the retiree to spend an ever-increasing amount of his portfolio each year, starting with an initial percentage, then indexed automatically to inflation as defined by the Consumer Price Index (CPI).

This simple but important series of calculations was called the Trinity Study, and since then it has been updated, tweaked, and reported on, and it's still the subject of lots of debate today. Wade Pfau is one reasonable voice in the industry, and he created the following useful chart showing what the maximum safe withdrawal rate would have been for various retirement years:



As you can see, the 4% value is actually somewhat of a worst-case scenario in the 65 year period covered in the study. In many years, retirees could have spent 5% or more of their savings each year, and still ended up with a growing surplus.

This brings me to a critical point: this study defines "success" as not going broke during a 30-year test period. To people like you and me who will enjoy 60-year retirements, that would not be successful – we want our money to last much longer than 30 years.

Luckily, the math in this case is pretty interesting: there is very little difference between a 30-year period, and an *infinite year* period, when determining how long your money will last. It's much like a 30-year mortgage, where almost all of your payment is interest. Drop your payment by just $199 per month, and suddenly you've got a thousand-year mortgage that will literally take you 1000 years to pay off. Increase the payment by a few hundred, and you have a fifteen year payoff!

In other words, ***above 30 years, the length of your retirement barely affects the safe withdrawal rate calculations.***

So far, we're liking the 4% rule quite a bit, right? But yet whenever I mention it, I get complaints. Let's review a few of them:

- The trinity study is based on a prosperity anomaly: the United States during its boom years. You can't project good times like that into the future, because we're just about to enter the Doom Years!
- Economic growth and stock appreciation was all based on cheap fossil fuels. How will this all look after Peak Oil hits us!?
- You can't take a one-size-fits-all rule and apply it to something as varied as an economy and an individual's life! My health care costs could go up! Hyperinflation could strike!
- Even at a 4% withdrawal rate, there's still a chance of portfolio failure. That means I'll be flat broke and out on the street in my old age. I recommend doubling your savings, and going for a 2% SWR instead because there's never been a failure in that scenario!
- This is all wrong! Waaah, waaah!

That's all well and good. While there are solid economic analyses that I believe can out-argue the points above, I'm not patient or clever enough to re-create them here. Pessimists are free to enjoy their pessimism and even write about it on their own blogs.

Instead of debating unprovable points like those above, we can completely squash them with our own much more powerful list of points:

The trinity study assumes a retiree will:

- never earn any more money through part-time work or self-employment projects
- never collect a single dollar from social security or any other pension plan
- never adjust spending to account for economic reality like a huge recession
- never substitute goods to compensate for inflation or price fluctuation (vacation in a closer place one year during an oil price spike, or switch to almond milk in the event of a dairy milk embargo).
- never collect any inheritance from the passing of parents or other family members
- and never do what most old people tend to do according to studies – spend less as they age

In short, they are assuming a bunch of drooling Complete Antimustachians. You and I are Mustachians, meaning we have far more flexibility in our lifestyles. In short, we have designed a Safety Margin into our lives that is wider than the average person's entire retirement plan.

So now that we're feeling good about the 4% rule again, let's bring the point home:

Far from being a risky proposition, planning for 4% Safe Withdrawal rate is actually the most conservative method of retirement saving I could possibly recommend.

To apply it in real life, just take your annual spending level, and multiply it by 25. That's how much you need to retire, at the most. A $25,000 spender like me needs $625,000. I've got more than that, plus various safety margins in the lifestyle, so all is good.

Without undue risk, and as long as you have skills that can be used to earn money eventually in the future (hint: you do), I can even advocate an SWR of 5%. In other words, get your expenses down to $25k, and you can quit your job on $500k or less. Then you can use the methods described in First Retire, then Get Rich to gradually increase your safety margin (and effectively decrease your withdrawal rate) as you age.

So there's no need to debate. 4% is a perfectly good answer, which means 25 times your annual expenses is a perfectly good goal to save for. Along the way, you might find your annual expenses melting away, which makes things ever-more-attainable (as shown in the shockingly simple math behind early retirement post). But worry, you must not.

And if you're ready to play with the numbers even further, check out the FIREcalc website. It's basically like owning your own Trinity Study machine, except you can tweak variables (look at the tabs at the top of the page). In the link provided, I used this data:

- 500,000 portfolio
- 25,000 annual spending (5% withdrawal rate).

All alone, a plan like that over 60 years of retirement only has a 45% success rate, historically speaking.

But if you make adjustments which include:

- $8,000 per year of social security starting about 25 years from now
- "Bernicke's Reality Retirement plan" of dropping spending slightly with age
- Just $3,000 per year in fooling-around income

You're already at an over 90% success rate. Another hundred or two dollars per month and you have a 100% chance of success, even without invoking many of my other bullet points above.

So that, at last is the long-awaited Safe Withdrawal Rate article.

In the hands of financial infants, the rule is dangerous and scary. But in the hands of Mustachians, nothing is scary. Planning for a 4% withdrawal rate is a shiny, bulletproof limousine of a retirement plan and you can ride it all the way to the party at Mr. Money Mustache's house.

My Deprived Life: Raising a Family on Under $27,000 per Year

By Mr. Money Mustache

Fri, 01 Jun 2012 12:00:33 +0000

One of the biggest objections we get from new readers around here goes something like this:

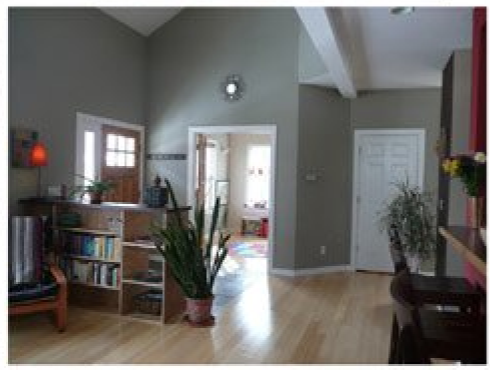
> ***"Yeah, I guess Mr. Money Mustache has a point. Spending less than you earn really is a good idea. Too bad he's so hardcore, though. I'm not ready to cut back my own life to the bone like he has, so I could never live on less than $40,000 per year – let alone raise a child on that budget!"***

This lament comes up again and again, no matter how many times I insist that the Mustache family leads a pretty fancy lifestyle, with no cash constraints of any sort. People still don't believe me, and they don't have time to read the older posts which explain things step-by-step. So let's just present a summary of what life is *really* like when a family of three lives on well under $30,000 per year in early retirement. This post will then become a piece of reference material, so I can link back to it whenever the topic of how deprived our life must be comes up again.

Please don't take this as a celebration of materialism and excessive spending. My point is not to say "Yeah! Look at all the fancy things we have!". It's actually with a certain amount of guilt that I present this series of pictures, because I know it's far from the minimalist ideal that many of the happiest people of the world pursue. All I can say is, "this is where we are now, it's obviously more than enough, and over time we're finding we want less and less, rather than more and more".

Following the style of those Forbes Magazine top ten lists, we'll cover each aspect of the lifestyle with a picture and description, then follow up with notes on how we try to get the most out of each area of life while minimizing the cost. After all, just as important as the *amount* of money you spend, is *how efficiently* you are able to spend it.

The House



This is our most excessive piece of lifestyle, as we live in a 2600 square foot house worth about $400,000, in a city where the average is a little over $200,000. Around here, that buys you a 4-bedroom house in great condition, in any of the nicest neighborhoods of the city. The house has four bathrooms including a master suite that is straight out of a design magazine. All of the city’s best amenities, as well as high-paying jobs and fast bus lines to other cities, are within a short walk or bike ride.

—

A quick note from 2021, nine years later: *WOW, things have sure changed! Due to a long housing boom that is still happening, the house we lived in back then would now be worth over $700,000, and even tiny houses in this neighborhood start in the mid-400s.*

Of course, to early retirees this housing “feels” cheaper than ever because our investments have grown even faster than housing prices. It’s a lesson to *invest early, and often, in assets that appreciate (both houses and stock index funds). But it's also a lesson to shop around before settling down somewhere: there still plenty of other nice cities where houses are still cheap.*

—

How we get it for less: We bought this house for $350,000 about six years ago. At the time, it was underpriced by almost $50,000 due to a motivated seller and a lack of market research on the part of the agent. We toured the house on the first day it went to market, and had the offer in on the same day. Since then, I've spent almost a thousand hours of my own time renovating the house to add upgrades like wood floors instead of carpet, ornate tiles instead of plastic shower pans, and other details that make me happy. It all came at minimal cost due to the fact that carpentry is my idea of a good time – it feels like play rather than work to me. This also means home maintenance and repair costs virtually nothing – I can often find the materials through Craigslist and the labor is free.

The house is also strategically located: property taxes are only $2400 per year. Good solar design and insulation in a sunny but moderate climate keeps our combined heating and cooling bills under $450 per year. Understanding our electric use and low local electric rates means electricity bills are under $25 per month. Is housing much more expensive where you live? I had the same problem – I had to move here deliberately to find the right combination of good and affordable.

The Toys:

We have all the stuff we need. Too much stuff. Five working computer systems sharing a high-speed wireless network system stocked with movies and music. A video projector in the basement with an 11-foot screen for movie nights. A stereo system that can reproduce the richest and most detailed music you've ever heard, and five other systems which also play music. A complete Ludwig classic 1994 maple drum kit. Two guitars. Microphones and mixers. A frickin' five-foot-long Didgeridoo bought directly from its Aboriginal maker in Australia, who also taught me how to play it. A set of carpentry tools complete enough to build an entire house from scratch. An enviable set of educational toys for the little boy. Six bicycles*. A Sevylor inflatable kayak. Great camping gear. Workout gear. Snowboarding gear. Too much!

How We Get it for Less:

At 37 years of age, I'm getting old. I've been earning adult wages (and/or investment income) for about 17 years now, and every year I have been tempted or tricked into acquiring more of the luxury items listed above. I bought most of the things used from Craigslist, inherited them for free from friends or family or rental house tenants who abandoned them, or traded for them through barter arrangements. For the rest, I did agonizing comparison shopping, considering each purchase for months before making it. Everything is of fairly high quality, which means it tends to never break, which means it ends up accumulating over the years as you get older. I'm not proud of having so much stuff. But I'm mentioning it just to show that we do not lead a life of deprivation.

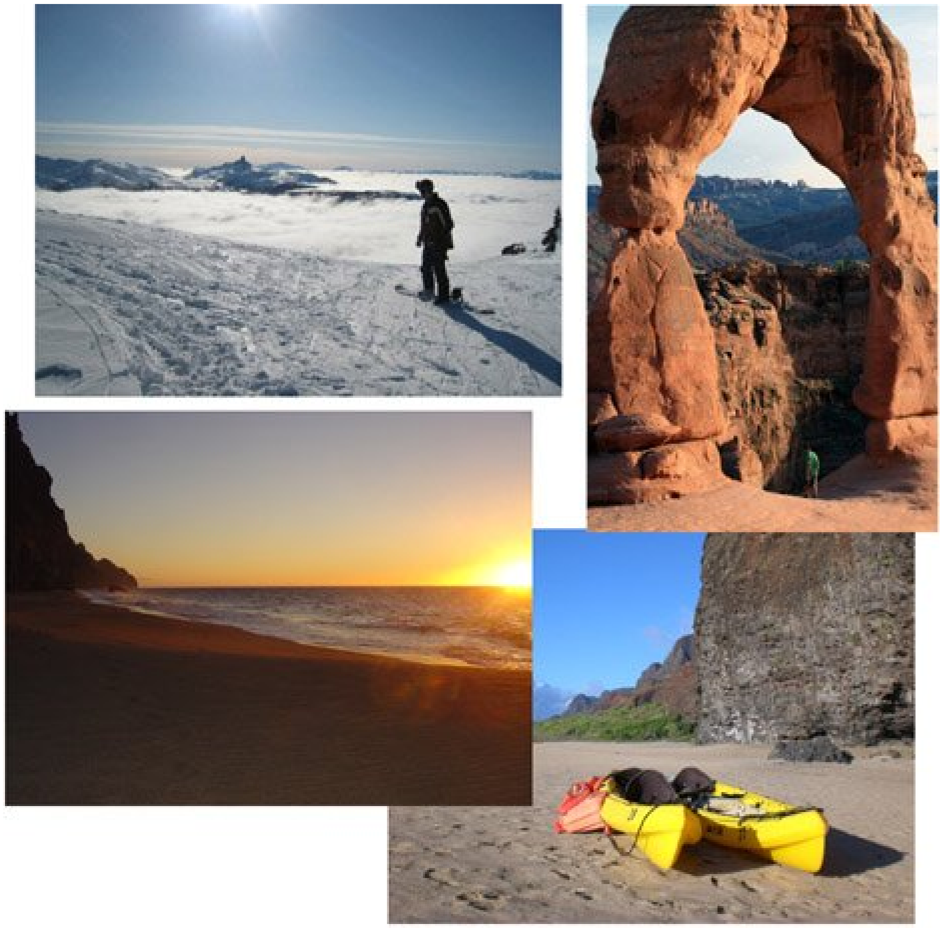
The Place in the World

The Money Mustache Family lives, in my own humble opinion, in one of the nicest places on Earth. The Boulder County area of Colorado sits on the edge of the Rocky Mountains, where constantly sunny weather lights up the sparkling glacier-fed streams. You can ride your bike out of your driveway and soon be in a canyon where 2,000-foot cliffs tower on each side of you, a river rushes along at their base, and rock climbers look like tiny ants strung up in the sky above. Bike just a little further and you can set up a tent in an area of wilderness that shows absolutely no sign of human influence as far as the eye can see. Yet you're surrounded by cities and small towns which connect you by trade to the richest economy in the world with minimal taxation and regulation. And yet, it costs almost nothing to live here relative to the wages available, since food and housing are so cheap and land is plentiful. As with many places in the United States, this place is Pure Freedom, expressed as a series of geographical features.

How We Get it for Less:

We settled down not in the city of Boulder itself, (where a house like mine goes for over $1 million), but just 12 miles down the road in Longmont. It is drastically less hip and fashionable, and the richer Boulderites mock it endlessly, imagining it as a dim expanse of mullets and meth labs. But they're dead wrong: living here for six years I mostly see towering trees, clear streams, natural people and happy families. And even a little bit of hipness creeping in, if the growing number of cruiser bikes, Subarus, beards, and packed microbreweries can be considered a measure of such things.

The Vacations:



As your life changes, your travel preferences will probably change as well. As twentysomethings, my wife and I saw a bit of the world including Australia, New Zealand, Italy, Hawaii, Mexico, and of course Canada and a great amount of the US. Now that we're parents to a six-year-old, we keep things a bit more tame by staying mostly within North America. But that doesn't mean sitting at home at all times. Even at this age, our son has been to four countries and about 20 US states. We spend about 3 months traveling each year and plan to do more as he gets older.

How We Get it for Less:

Mrs. Money Mustache is a travel planning enthusiast. Travel is one of her interests, which is why we do so much of it. She combs the Internet and gets ridiculous deals on flights and hotels. We use high-reward credit cards to get free flights and cash back. We sometimes travel by road in a fuel-efficient small car, bring our own food, and camp out in Nature for some of our US-based vacations. We aren't impressed by valet parking or $20 drinks and $100 steaks, but we ARE impressed by 14,000 foot peaks, coral reefs, wilderness preserves and untouched beaches.

The Cars:

I write about bikes pretty often, so I must be one of those wacky car-free people right? Wrong again! I actually love cars and am a closet gearhead. Throwing aside practicality, I *would* own an all-electric Tesla Model Y (a practical 7-passenger crossover which also just happens to be one of the fastest cars in the world) and a custom-built Mercedes Sprinter cargo van converted into an RV for extended travel.

How We Get Them For Less:

But instead, I have forced myself to acknowledge that expensive cars are a big drain on the wallet and don't actually deliver lasting happiness, so I focus on practicality rather than the latest luxury. We have a 2005 Scion xA ("Xena") for most of our rare driving, and I also have a 1999 Honda Odyssey minivan ("La Mujer Azul") for hauling the tools and lumber for my part-time construction business. The Scion can carry us all in great comfort at over 40MPG. The van occasionally gets to come out on camping trips, which makes her happy as well.

Both vehicles were bought used, and yet are in nearly-new condition and have never broken down or demanded much beyond oil changes and wipers. Part of this is the fact that combined, we drive less than 7,000 miles a year and it's mostly for long highway roadtrips. Despite a combined current value of less than $12,000, they are far more than we could possibly justify needing.

The Food:

Oh, the luxury of good food. We don't need it to be happy (I could live just fine on beans, rice, fruits and vegetables), but somehow we manage to buy fancy food every week and go to great lengths to prepare it in entertaining ways. We invite people over for parties and feed our expensive food to them frequently as well. Most of our food is organic these days, and gluten-free due to my wife's dietary needs. All of these things cost more. I enjoy and appreciate them, but they are far beyond being basic needs, which is why I'm acknowledging them here. Dig in!

So What's Missing?

Many people who are new to this blog add up their own budget, and find it's a lot bigger than that of the Mustache family. So what are we doing so differently that allows this seemingly-normal lifestyle to occur at such a low cost?

Most notable is the virtual absence of a "miscellaneous" category. We have a lot of stuff, but it was bought only once, and most of it long ago. I often go for months with no need to visit *any* store beyond the grocer, and the hardware store for construction supplies. We don't buy high-heeled shoes or massages, and probably eat out at a restaurant once a month on average.

Then there's the absence of driving. We drive only when it's time to go to another city, which is only once every week or two. No trips to the store, no commuting to work back in the working days, no driving just for fun. That shit is what BIKES are for. This paragraph alone can cut some people's expenses in half.

Then there's the child-raising. Having only one kid is obviously less expensive than having more (child-related stuff has averaged $300 per month for us for the 6.5 years of his life so far). But there's great variability in how much you choose to spend on being a parent, and spending more doesn't make you a better parent. I like to call it Avoiding Ivy League Preschool Syndrome.

Finally is the absence of *interest payments*. I've never been in debt, with the exception of one year of car-related foolishness when I was young and a few years of paying off a mortgage. A lifestyle like the one in this article could easily cost $60,000 or more per year if you jumped into it by borrowing for everything. But by owning the stuff you use, life becomes much cheaper.

Of course, owning things is not exactly free either: besides the annual spending, there's real money tied up in this house and stuff. If we sold it all and moved to a rental house and rented the cars, bikes, and furniture too, living costs would rise. But in the end, it's just one of the two parts of the savings required to pay for a lifestyle:

- the stuff you own outright (the things in this article cost somewhere in the mid-$400,000s, mostly in the house)
- the income-producing assets you own (stocks, bonds, real estate, businesses, etc.), which pay for your annual outflows. To provide $27,000/year in income using the 4% rule, you need an additional $675,000. (Since I have a rental house as part of my income that provides at a much higher than 4% rate, I could get by with even less than this).

In other words, a lifestyle like this can be sustained indefinitely on around $1M in savings, with no need for any additional income. A million dollars – remember that number? That's the amount that used to be big, but that everyone says is far to little to retire on these days. My whole point here is that it's still way more than enough.

The Future:

Life is full of change, and I'm looking forward to lots of it myself. We're still only beginners in this life of not working for a living (although still working plenty for other reasons). And there's still lots of baggage left over from the days of being more consumption-oriented.

In the long run, I'd like to live a simpler life in a smaller house with less stuff. As our boy gets older, we want to involve him in more work and adventure, so he doesn't grow up knowing only this life of easy material abundance. So while the doubters will continue to accuse the Mustache family of living an overly frugal lifestyle, you're only going to see it get simpler from here. Even as income and happiness is rising over time, excessive spending and materialism can drop away as you figure out what's really important in life.

** after hearing that part of the article, my son informed me that I should count his new bike in the total and be sure to include it in the picture. So make that seven bicycles.*

The Lovely Low Taxes of Early Retirement

By Mr. Money Mustache

Mon, 04 Jun 2012 12:00:16 +0000

A sand island at the local lake, part of a recent "workday" with my boy.

Despite the occasional complaints voiced by those who feel they are Taxed Enough Already, I'm always pleasantly surprised at the low tax rates that US residents pay (myself included).

I guess it all depends on your frame of reference: the Canada that I left in the late 1990s had a marginal income tax rate of about 50% at the time, which kicked in at an income of about $60,000. I had almost reached the top tax bracket just two years out of school, which I found was a disincentive against going on to earn a much higher income. Since then, Canada's tax rates have dropped drastically, leaving them much more competitive with the US.

But for this article, let's see exactly how good or bad the situation really is, using the Money Mustache family as a case study.

Looking at my recently-filed tax documents, it looks like we had about $72,000 of income for the 2011 tax year. That's a mix of the rental house income, dividends, a few carpentry projects for me, a bit too much part-time work for Mrs. MM as she helped some people through an unexpected crunch, a bit of blog income and some capital gains. It was an unexpectedly flush year, and we'll do our best to earn less in 2012, lest the Internet Retirement Police start hassling us again about being "not really retired".

Countering this rather large income was the $1000 child tax credit, tuition credits for little MM's preschool, and of course the wonderful $11,600 standard deduction for two people married filing jointly.

When you add it all up, our Federal taxes (including social security and medicare) were $4884, with an additional $2211 of State tax for Colorado. So $7095, or just under 10% of the income went to the tax man.

That's pretty reasonable, considering that it was such a bumper year of income. I've got Turbo Tax open in the other window right now, so let's see what happens if I delete all the extra income and keep only enough to pay for our regular spending of $27,000. To provide a nice safety margin, I'll scale everything so it adds up to about $30 grand. Here's how I've got it split up:

Wages and Salaries: $19,000
Taxable Interest: $59
Ordinary Dividends: $373
Capital Gains: $5190
Business Income (Schedule K-1): $5501

Total: $30,123

Now let's pull the lever and see exactly what we would owe on this level of income:

Federal Tax: $654 (mostly self-employment tax)
… then subtract the $1000 Child Tax Credit to get:

Net Federal Tax: **-346**
Net Colorado Tax: **$208**

Total tax: Negative One Hundred and Thirty Eight Dollars.

Wow. That's a pretty affordable tax bill, considering it's on over $30,000 of income, still a relative shitload compared to what one needs to live a happy life in this country!

This is of course an arbitrary income mix caused by me hastily deleting things at random from my own tax return. But at least I have some wage, dividend, capital gains, real estate and business income like a normal early retiree might have. Let's change it again to see what the situation would be for someone living entirely off of dividends:

Dividend Income: $30,123

Running it through Turbotax again, I get….

Federal Tax $0 (but apparently lazy people with no regular income do not get the $1000 Child Tax Credit, so no refund this time)
Net Federal Tax: **$0**
Net Colorado Tax: **$322**

Total tax: **$322**

This is an interesting result: the first case of regular income, even with the dreaded 13.3% "self-employment tax" comprised of medicare and social security contributions, is actually more tax-efficient than the dividend earner's setup.

People using rental real estate as their source of passive retirement income will have it even better: The depreciation allowance effectively shields 30-

50% of your rental income from taxes during the early years of owning a rental property. This benefit slowly fades away over a 30-year period and only then will you pay full income taxes on the rental income. I'm getting this benefit on my own tax return, but I excluded its effects from this article, to avoid confusing the issue and to allow an apples-to-apples comparison.

But in any of the above cases, the income taxes paid by a family like mine living on a retirement-level income are still **approximately zero**. This is why I rarely mention taxes when calculating things like the safe withdrawal rate. The unfortunate folks who do their retirement planning with the "you'll need 90% of your peak career income to sustain you in retirement" financial advisers will indeed need to plan for taxes. But we Mustachians will fortunately slip nicely under Uncle Sam's radar.

Of course, many of us will accidentally earn more than we need even in retirement, and we'll end up paying thousands in taxes each year because of it, just like I did this year. That's a happy compromise as well, as long as you're not an anti-tax activist. I'm aware that I'm using the many resources provided by this country, so I don't mind paying taxes for them. But since my entire lifestyle fits within the Zero tax bracket, I am only paying tax on the surplus income.

That makes me feel like the whole situation is entirely under my control. I can continue the current course, which works well for me. If I later decide I hate the government, I can strategically earn less money so I pay negative taxes as described above.

If I still like earning lots of money in order to maximize my power to do good in the world, but insist on paying no income taxes, I can even structure my work into the form of a charitable trust or nonprofit. This entity would pay me just enough money to get by without paying taxes, and it would donate 100% of its remaining income, tax-free, to scholarships for underprivileged kids, or schools and health care for African villages, or even Face Punching machines to be installed in shopping mall parking lots.

The world becomes a blank slate to be used for your own enjoyment. It's just another example of the freedom you get in early retirement. And it's just another example of why I don't accept complaints about taxes around here*. Save your money, build your ‘stash, and then the ball is entirely in your court .. for life!

** politically-charged complaint attempts deleted from the comments section of this article so far: 18*

Safety is an Expensive Illusion

By Mr. Money Mustache

Fri, 08 Jun 2012 05:44:55 +0000

Man, I sure lead a risky life these days. I've learned that I am on the bleeding edge of so many wild frontiers, it is a wonder that I'm still alive. When you add in the fact that I'm also in great health, happy and content with life, and I even still have all of my fingers and toes, I am expecting a call from the Guinness Book of World Records any day now.

Let's review a few of the risks people have told me I'm running:

- When I write about my strategy of driving only small, fuel-efficient cars, people chime in about how dangerous it is to drive anything except large trucks like the Chevrolet Tahoe.
- When I write about how we should all ride bikes, people whine about the danger of getting hit by cars while cycling.
- When I describe my love of carpentry and the power tools which make it possible, I get tales of severed fingers and punctured eyeballs.
- When I suggest that it's more cost-effective to use only high-deductible health and home insurance, people talk about the risk of chronic diseases lurking just around the corner and the litigious people with slippery shoes who might fall on my sidewalk.
- When I write about how I never keep more than a few thousand dollars in uninvested cash around (instead of the $30,000 "emergency fund" that beginner financial advisers suggest), people gasp and talk about the dangers of holding only volatile investments.
- I've been riding dirt bikes and motorcycles for 22 years now.. long enough to receive dozens of lessons about how dangerous those Death Machines are.
- I've even received earnest lectures about the dangers of microwave ovens, cell phones, wi-fi routers, fiat currency, nonstick pans, and the radioactive fallout from Japanese nuclear reactors. All of which I have taken no precaution against.

So I've come to realize that I really am *living on the edge* by modern standards.

How could this be? Why does our society have this obsession with safety and danger anyway? Have they picked it up from watching TV during these past fifteen years since I tuned out of the medium?

Modern media seems to have figured out that Fear Sells*. If it's possible to portray something as Scary, those sumbitches will find a way to do it. They've noticed two things:

- ***Fear* will keep you glued to the TV set**
- ***Fear* will fool you into making purchases "to protect yourself"**

I see all of this as breaking down to two possibilities: Either I really am a radical risk-taker and these detractors of mine are much more sensible than I am. **Or maybe, just maybe Mr. Money Mustache has actually thought about all this shit and *still* come to the conclusion that life is safe enough.**

As it turns out, I like doing the math on things like this. I can't keep myself from making estimates of the Expected Value of almost every life action you can put a number on. These calculations happen whether I want them to or not, so I might as well make the best of it.

Let's use the often-repeated Small Car Argument as an example.

I love small cars – the smaller the better. Better handling, easier parking, less wasted materials, and much better fuel efficiency. But some people think small cars are unsafe. They like to repeat scary statements like, "In a crash, the big vehicle wins. End of story".

But let's look into that a bit further. The US government agency called the NHTSA compiles statistics of every major crash that happens in this country, and they've been doing it for decades. This has helped car manufacturers improve their designs to the point that fatalities (per mile driven) have dropped by 85% since the 1950s. What's the rate today? About *one fatality per hundred million vehicle miles driven*.

Next we can compare the fatality rates by vehicle type:

Table 2: Total Occupant Fatality Rates per 100,000 Registered Vehicles by Vehicle Type and Size, 2004

Vehicle Type and Size	Rate
Compact Cars	17.76
Compact Pickups	16.87
Subcompact Cars	16.85
Midsize SUVs	16.16
Standard Pickups	13.87
Full-size SUVs	12.34
Full-size Cars	12.16
Midsize Cars	11.49
Minivans	11.09
Large Vans[2]	9.34

The measurement is a little different, since this chart compares fatalities per 100,000 vehicles instead of per mile. But we can still reasonably estimate that my subcompact car is about 16.85/12.34 = 37% more dangerous than a full-size SUV. (**also note that midsize cars are safer than SUVs of any type, further proving that the S is for Sucka**).

In an average year, I might drive 7,000 miles. So I've got a 7000/100,000,000 chance of killing myself by driving in any given year. In other words, there's a 99.993% chance of surviving.

I've got at best 60 driving years left in my life, so over a lifetime my chance of survival is (99.993^60), or 99.58%. In other words, driving causes an expected 0.42% reduction in my lifespan. 0.42% of 60 years is about 4 months.

If I increase my chance of dying by 37%, I subtract another 1.5 months from my expected lifetime.

Is driving a Chevrolet Tahoe instead of my 2005 Scion xA for 60 years worth that extra 1.5 months of life I'm expected to gain from it? Let's put that another way.

Driving 7,000 miles a year for 60 years adds up to 420,000 miles. According to the EPA website, the 2005 Tahoe gets 14MPG combined, using 30,000 gallons of gas costing $120,000 at today's prices.

The Scion, burning at the EPA estimate of 30MPG combined (even though I average about 42 in mine), will use up $56,000 of gas. The fuel savings is $64,000. The savings over a lifetime of buying and maintaining smaller vehicles is even larger, but for this argument, fuel savings alone is enough to make the point.

How long do you have to work to save $64,000 after taxes, commuting, and other work-related expenses? I'm guessing it is at least 6 months, and more likely two years or more.

So the 'safe' SUV driver is working an extra two years, in order to extend his life by 1.5 months. That is not my idea of a good life strategy.

And that's before even taking into account the happiness gained by driving a sweet little well-engineered Japanese car instead of a gigantic piece of shit that can barely navigate a parking lot!

Ok, that example ran a little long, but it sets us up nicely to handle the rest of the list in a flash.

As it turns out, riding a bike extends your lifespan (due to health increases) by between **20 and 100 times more** than it subtracts due to statistical risk of crashes. Ride a bike, and you can expect to live a lot longer, it's as simple as that. Add in the cost savings from cycling, and the decision becomes even more obvious.

Investing your money in productive assets like stocks provides much greater returns than keeping it "safe" in guaranteed accounts which don't even keep up with inflation.

Over-insuring yourself for any risk (including medical bills) provides a guaranteed stop on possible annual losses, in exchange for a *statistically guaranteed* larger lifetime loss in wealth. I can do the math almost as well as the actuaries at the insurance company can, and because of that, I carry insurance only against the most catastrophic cases (which don't include minor things like totaling a car or under $10,000 of damage to my house).

Carpentry and power tools provide guaranteed returns in exchange for an acceptably small amount of risk, so I take the risk and continue to profit.

The microwave and the cell phone present no statistically significant risk to human health. Even if there was a risk, it would very likely be lower than the utility that these devices provide to my life, so I'd still use them.

Do you see the pattern now?

The risk-fearing Complainypants types always focus on the negative consequences of any possible activity.

What they're missing is ***the risk of not engaging in that activity*.** That risk is just as real, and it's usually larger. But it's a more hidden and less scary risk, so they take it, and over time they lose.

Statistically, there only two risks in modern life that are significant enough to get me a little scared:

1. **The risk of wasting my life by not living it to its fullest**
2. **The risk of ruining my own health at an early age, possibly limiting my ability to accomplish #1**

For most US residents, both of these carry a probability that is astronomically higher than everything else described in this article combined. Upwards of 50%.

It's so huge, that almost no other risks matter by comparison. So we can happily ignore everything else and focus on just those two things.

My goal for the Mustachians is to constantly whittle both of those numbers down toward zero. Interestingly enough, the best way to accomplish it is often to fuck the conventional notions of "Safety" and start putting some good old-fashioned Risk back into your life.

Update: One year later, I dug into the bicycling statistics a bit more and wrote another article on scaredypants disease. Biking turned out to be a little bit more dangerous than I had estimated, but it still easily wins as the safest form of transportation, because it extends your life by much more than it subtracts. Many complaints poured in over the minute details, but none were able to overcome the logic that is similar to this article: NOT cycling (or walking extensively every day) is a guaranteed loss. Sitting on your ass at a desk is *extremely* hazardous to your health. Cycling is a huge gain, with a small and easily mitigated accident loss that you subtract from that gain.

**Fear Sells: That is surely why the Bullshit TV News focuses on scary and irrational short-term issues. But you know what? I'm finding that Optimism Sells as well, and it sells to a much nicer audience. To some, this is just a natural way of viewing the world, but it seems we're an under-served audience. Optimism is also why I sought out that guest article from Jim Collins– he's one of the few other people out there correctly reminding us that Everything is gonna be All Right.*

Get Rich With: Good Old-Fashioned Trust

By Mr. Money Mustache

Tue, 12 Jun 2012 03:12:24 +0000

This nest in our front-yard tree has raised five generations of robins. Note this year's remodel – some shredded strips of one of my credit card statements.

It was the fall of 1992, and the teenage version of Mr. Money Mustache was getting his first peek at a whole new world. The World of the Wealthy.

I was on a date with one of my first-ever girlfriends. She was way too attractive for me, which already induced nervousness. We had been dating for a while, and I guess things were going well because she had decided to introduce me to her Dad, who lived in another town. I was ready for terror and interrogation.

As we drove up the leafy winding road to his private, custom built house, I felt I was entering another league entirely. In my hometown, people didn't live like this. We walked through the front door and there was her father – a friendly and casual 40-something dude, looking stylish in his faded jeans and sporting a bushy Tom-Selleck-style black Mustache.

The vibe was completely different from any girl's father I had previously met. Most of the Dads of my town were strict, conventional, and even a bit irrational in setting rules for their daughters. But this man treated both his daughter and her new boyfriend as adults. He was funny and bright. He told interesting stories about the successful photography company he was running. After a bit of chit-chat he gave us a quick run-down of where things were in the house: TV room, hot tub, keys to the fancy car if we needed it. Then he took off to attend a meeting with one of his business partners, leaving us with the whole place to ourselves, for most of the night.

"Wow", I remember thinking. "This old guy has entrusted me with his daughter, his house full of cool stuff, and his car, after meeting me for all of fifteen minutes. I've never seen anything like it!". A feeling of fancy adult responsibility washed over me and I made a point of not abusing his trust. We even washed all his dishes that night.

Over the decades that have followed, I've noticed that pattern in several more places. Successful people are usually more trusting. Less successful members of the middle class are often obsessed with locking up their houses and cars, suspecting that the world is out to get them, and avoiding risk.

The pattern also seems to apply at the corporate level. The first company I joined after moving to the US had a culture of micromanagement. The employee handbook specified that no personal emails or websites were to cross into the company's network, ever. The CEO was notorious for second-guessing coding decisions of individual software engineers. Vacation time was closely guarded and merit-based-pay was almost nonexistent. I jumped ship from that job to a better one after only 10 months. The company went out of business shortly after I quit.

The next company was a model of employee trust and fair treatment. I was given a generous budget to buy whatever I needed to get my job done. I could book my own business travel without approval. Working time was not monitored and vacations were self-scheduled and self-reported. I worked much harder at this place, and at the time it was one of the most valuable and profitable companies in the world. (In recent years the employee experience has gone downhill but it is still a profitable and huge company).

Even on the bigger scale of entire countries, it turns out that there is a strong correlation between trust and wealth, and in fact *trust precedes and causes wealth* in countries as they develop. In an interesting passage of *The Rational Optimist*, the author noted a 2008 Princeton study on this effect. It found that 65% of Norwegians answered a question indicating that "most people can be trusted", while only 5% in Peru felt the same way.

Once you frame the issue as "trust", you can see the effects all over a prosperous economy. People are willing to build houses and factories on their land, because they trust it will not be confiscated by government or revolution. Companies are able to grow quickly, because they can get huge amounts of funding from investors who trust that their ownership rights will be preserved. The entire concept of money exists only because of a massive network of trust that exists in modern rich society – a shared reassurance that the money will continue to be worth something tomorrow (despite the perpetual insistence of gold bugs worldwide). Without all of this trust, we would spend much more of our time worrying and devising safety systems and much less time actually getting things done.

The effect of trust is amazing when you think about its effect on your daily life.

A few weeks ago, I decided to finally re-paint the peeling exterior of my house. It's a big place that would have cost at least $3000 to paint if I hired a contractor. Instead, I told a friend who runs a small painting company of my plans. He mentioned that he gets a 15% pro discount at the paint department of Home Depot, plus he had a one-time 20% off coupon valid on a specific day.

We went to the store together and bought my paint along with some supplies each of us needed – on his credit card. The store was running a 12 months-no-interest promotion, which further sweetened the 35%-off deal we were getting. My portion came to just under $400. We agreed that I would pay him back before the 12 month period was up. Then we walked out of the store with an enormously valuable haul of products, bought only on a signature, to be paid back with no interest charges almost a year in the future.

Then we further complicated the picture with additional trust. He lent me his thousand-dollar paint spraying machine, a selection of huge ladders, other painting equipment, and spent a full day helping me get started. No payment was made – I just repaid the favor by helping him an equal amount on his own projects. I also ended up paying back the full cost of the paint through further barter arrangements.

In the end, I completed the $3000 paint job at an out-of-pocket cost of $0, with only the "cost" of spending a few spring days getting some exercise in my own back yard. Climbing up, climbing down, moving ladders, spraying, rolling, cleaning, and learning. All made possible by great amounts of trust!

So how does all of this apply to building a Money Mustache? I personally use the knowledge to shoot down the phrase "You can never be too careful." Because I feel that yes, you sure as hell CAN be too careful. Just as with the recent article on Risk and Safety, there is always a cost to every bit of caution you apply. Mistrust adds extra cost to every transaction in your life, whereas trust makes those transactions glide nicely. And transactions, whether they are dinner dates, bike rides, work contracts or friendships, are of course the source of much of life's wealth.

Make a point of surprising your own friends, children, and employees by giving them more autonomy and responsibility than you would normally do. Watch them flourish and grow and make your life richer. Give out your house keys to close friends or lend them your car if they need it.

You can stop safely short of being a gullible fool, of course. You won't be responding to spam emails or signing up for multilevel marketing schemes or timeshare properties. The beauty of practicing trust is that you also develop the skill of knowing when to dish it out. But if you're not already one of these wealthy trusting people, you should be pushing your boundaries at least a bit.

Occasionally, you will probably get burned, just as I did with The Big Mistake. But that's no reason to stop trusting! Mistakes are just high-end lessons, and they should only serve you to refine your Get Rich Through Trust machine.

I've made much more through trust than I could ever possibly lose through past or future mistakes. When you comb your own personal history for evidence on the power of trust, and combine it with the scientific evidence that it works at every scale from small to large, you'll find that it's the only rational choice.

The World's Most Efficient Air-Conditioner

By Mr. Money Mustache

Thu, 14 Jun 2012 17:39:16 +0000

Well, I'm finally done building that fence I've been meaning to build for the last few years. It came out great, and now we at last have the nice, private yard that this house of ours deserves. But as with every do-it-yourself project, other unexpected benefits were revealed as well, and one of them was that I ended up with a free air conditioner of unsurpassed efficiency.

To get this fence built Mustache-style, I didn't whip out my cell phone and credit card and call a fence contractor. I had to do it myself, and since it was my first large-scale fence (about 180 linear feet at 6 feet of height), I kept track of some of the stats.

I had to set 25 posts of treated lumber into the ground. The posts were each 8 feet long, weighing 30 pounds each and set into about 80 pounds of concrete. Of course, before setting each post I had to carefully line up and carve a 2-foot-deep hole in the rocky, dry Colorado hardpan soil. Each of those 80-pound piles of excavated soil and rocks was the result of several minutes of wrestling with a burly electric drill equipped with a 3″ soil auger (a very useful invention!) followed about 100 blows with a manual post-hole digger, and occasional attacks with a sawzall to cut through roots, a diamond blade grinder to cut through concrete, and a handheld jackhammer to chip away anything that remained. And all those holes were just to get me to the point of hand-mixing over 2000 pounds of concrete, manually tailoring, drilling and screwing over 100 cross pieces, and nailgunning in 500 cedar planks, cutting and bending each to coax their naturally-curvy demeanor into the extremely tight and straight fence that I wanted.

All in all, it was about 69 hours of work, and it was done through a period of record temperatures in my area. Some days topped out at over 100 degrees Fahrenheit (37C), and few were below 80. Half of the fence is in full sun, leaving me with only SPF 80 sunscreen and my sun hat for shelter.

But a strange thing happened as the days went on and the fence sections were completed, one after another. I stopped noticing the heat, and started feeling downright comfortable. The improvement was so dramatic that I thought it was the weather that was changing rather than me. Often I'd walk past my outdoor thermometer on the way to refill my water mug, and be shocked to see another mid-nineties reading, when I felt like it was under 80. And at the end of each day, I'd find myself inside the house feeling comfortable even with a shirt on, noticing an indoor thermometer reading above 85. In previous years, I had felt the need to turn on the air conditioner at around the 80 mark. Morning house temperatures in the high 60s suddenly felt bone-chilling to me, even though in the winter I normally curse the stuffy house and go outside to get some fresh air if someone turns the thermostat above 67.

What I had done with all this work in the heat is given myself the gift of Heat Acclimation. This is a form of Badassity that is not just something made up by the most spartan of Mustachians. It's a real and scientifically measurable body adaptation – a gift of comfort that YOU should give yourself this summer, because the benefits are enormous.

To get some of this goodness for yourself, it helps to understand what it is.

When a normal office worker encounters unusual heat, his body tries to cool itself by sweating. The body also circulates heated blood out near the skin's surface, allowing heat to radiate and convect through the skin and evaporating water. That's why overheated people often appear more reddish in color.

The problem is that this leaves less blood in the core of the body where the muscles are working, and it requires a higher heart rate for any given volume of work. In short, you slow down at whatever you are doing, and if you push too hard you start feeling like shit and just want to lie down in the shade.

But when you're out in the heat, your body is starting to wise up to the situation. It creates more blood, the endurance of your sweat glands increases, and the ability to sweat efficiently at the first sign of heat increases. You really do become a Badass Heat Survival machine, and research indicates that you'll see significant results within **just one week** of spending an hour or so outside in the heat doing light exercise like walking or biking. I'd estimate that my own acclimation has sliced about 12 percieved degrees Fahrenheit off of this summer's heat.

The more you do it, the better you get, as witnessed by the Phoenix-area MMM readers who insist that they can easily bike to work year-round in that hot desert city where daytime highs are rarely below 40C (104F) for months on end. This also explains the amazing abilities of my Mexican concrete subcontractors back in the house-building days. These guys would often work alongside me on searing-hot days in black jeans and long-sleeved Denver Broncos sweatshirts, while I could barely survive with a white t-shirt, dark sunglasses, and enormous straw sombrero.

In other words, when someone says, "You can't spend time outside where I live, it's TOO HOT!", it's really equivalent to saying, "You can't bike to the grocery store where I live, IT'S FOUR MILES AWAY!" – it's not a question of impossibility, just of acclimation.

But this post isn't really about extreme heat survival, like those 120F Phoenix days. It's about a much easier and more relaxing kind of heat acclimation – making the most out of your own climate in the summer months.

During the peak of the last hot season, I wrote a rant called "How Not To Use Your Air Conditioner", where I railed on the excessive use of A/C by modern people. This year, I'm doing it again, but with the added perspective of this new experience of extreme heat acclimation, because it works better than I thought.

Here's an interesting fact: because my house is fairly well insulated and captures a lot of winter sunlight, it acts as a significant buffer against weather changes. I've measured that even without a furnace and with no air conditioner, the temperature in here would never go below 40-50F in the winter, or above 86F in summer. In other words, if I were badass enough to put up with the full range of those temperatures, I could run with zero heating and cooling costs indefinitely. 100% of my costs (about $450 per year) are to fine-tune that temperature to allow my family a more luxurious lifestyle.

So as your wimpiness increases, so do your heating and cooling costs. At the extreme end of the spectrum, some people are such heat wimps that they cool their house to the meat-locker temperature of 72F in the heat of summer. You can spend $200 per month keeping a house that cold, even while the house's natural temperature without cooling might be barely above 80.

Gaining heat acclimation in the summer (and cold acclimation in winter) is about more than just utility bills. It also opens the world back up to you, allowing you to get out and do things that you'd normally wimp out of doing.

A common lament across America these days is this one:

> "I know Mr. Money Mustache taught me I have to get my groceries with a bike trailer, and I've been doing it all spring. But now it's just so hot out there, and he doesn't know where I live so he won't see me… so I think I'm just going to sneak out and use my air conditioned car until the hot season ends".

When Junior Mustaches pull stunts like that, they think they are fooling Mr. Money Mustache, but they are really just fooling themselves. Riding around in your climate-controlled car is just like taking another shot of heroin to prolong a lifetime habit. Instead, you can kick the addiction to comfort, go through the necessary downtime, and be free for life (see: Trainspotting).

So let's just try this experiment: get yourself out in the heat for at least a few minutes every day. Not just walking to the car, but seriously out in the heat. Go for a walk, try a run if you're a runner, bike to work, even go out fishing. Drink loads of water (during my fence work I went through about 4 32-ounce jugs of icy water every day). And eat a banana or two to help replace electrolytes lost through sweating.

Instead of increasing your suffering, you'll actually be building your ability to stop suffering. Take it up to an hour a day. Increase your A/C temperature by one degree every day or two. Watch your need for air conditioning drop drastically. Watch your enjoyment of the outdoors increase. Watch your Money Mustache grow.

A cautionary statement, not that people like MMM readers need these things: heat CAN be dangerous. Your body does need to keep its core temperature within a certain range, otherwise bad things happen. As physical fitness decreases and age increases, so does the risk of overheating. That's why when record heat waves strike, you always read about a bunch of elderly people kicking the bucket in their non-air-conditioned apartments.

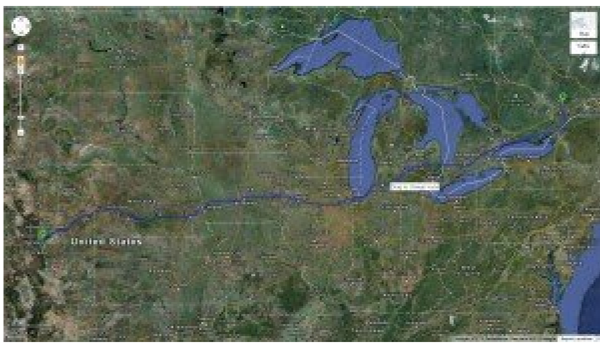
On the other hand, if you carefully and gradually push your comfort boundaries, just as with any form of other exercise or badassity training, you tend to extend those boundaries in a positive way. I try to spend at least an hour a day doing *something* at least mildly uncomfortable. Just as I once suggested that we should all learn to appreciate mild hunger, it is also nice to appreciate mild discomfort. Without it, you are on the slippery slope to lifetime wimpiness, a place much worse than mild discomfort!

I can see it's back up in the nineties outside there today. Full sun and no wind. It's far too comfortable down here in my basement office, so I'm going out for a ride!

‘Stache’s Out For Summer…

By Mr. Money Mustache

Mon, 18 Jun 2012 04:02:32 +0000



I’m writing this from an unusually clean desk, in a spotless and nicely vacuumed office, within a mostly polished and decluttered house. This, along with the tying up of a bunch of other loose ends, is why I haven’t been writing to you as much recently.

The Mustache family has been hard at work for the past week or so, preparing for a record-breaking trip to Canada (almost 8 weeks this time!). The stars of fortune have aligned yet again, and I have rented out our main house to the same family that stayed here the last two years. This means that our otherwise-empty house will again be paying for most of the trip, and that Mr. and Mrs. MM have to bust their butts to get this place in guest-ready condition. Scrubbing every last faucet and mirror, hiding the underwear and confidential documents, and other related tasks. In the end, it should work out just like last year, as noted in Making Money while Taking Vacations. We’re leaving on Saturday, June 23rd.

All this cleaning effort could be viewed as a hassle, but I like to think of it as a big plus instead. We’re not the Clean Freak type, so we could easily let the dust pile up in more obscure parts of the house for many years without this annual ritual. How often do you completely empty your kitchen “Junk Drawer”, purge unneeded items from your clothes closet, or polish the wood crown molding way above your cabinets? For me, it would normally be approximately never. But now we're feeling lean and mean… except for the secret pile of full cardboard boxes under the basement stairs.

Travel arrangements will be fun as usual. The lady and the boy are jetting directly to the house of the grandparents, leaving me to take a solo bachelor roadtrip across the country with the van full of tools and party supplies. I've got a great place to stay in Chicago (and may even meet up with some Mustachians there), but that leaves the first night open for options. So I'll throw this out there just in case:

Will Work For Couch

Do YOU live in the Des Moines, Iowa area along I-80? Do you expect to find yourself with an underused couch on the evening of June 23rd? If so, get in touch with me through the contact button! I can provide entertainment, advice, treats from the Triple M Microbrewery, or any other appropriate thank-you gift. Despite the easy availability of hotels along the route, my tradition on these solo trips is to be more unconventional in accommodation. Sometimes I meet friends. Other times I'll use the van as a camper at a quiet rest area or a luxury hotel's parking lot. The tiny bit of adventure definitely adds to the experience.

So I'll be writing less for those 8 weeks. Maybe. Sometimes I can't stop myself, so maybe I'll write more.

Speaking of lots of writing, have you checked out the new feature on the right sidebar of the main page? A brilliant programmer named Brian Richards whipped up a quick PHP template for WordPress that automatically fetches all the MMM article titles since the beginning of time, and puts them in a chronological list for easy scrolling. Here's the link: **https://www.mrmoneymustache.com/all/** **. (**Thank you very much for this, Brian!)

So while my writing may be slow in the summer time, the list of topics which must be covered never stops growing. I've got no choice but to keep writing on this blog for a long, long time yet.

And just for fun, I'll give you a peek at what is to come when free time returns. **An exclusive look behind the scenes into Mr. Money Mustache's Drafts Folder!!**

Some of these mostly written, other are just ideas, and surely some will never see the light of day. The titles may change. But they're all still waiting there, taunting me and asking to be published when the time comes.

What else do you think we should add to this list? Let me know in the comments section below.

I Just Gave Up $4000 Per Month to Keep My Freedom of Speech

By Mr. Money Mustache

Thu, 21 Jun 2012 06:17:24 +0000

Wow. Four thousand dollars a month.

It was Automatic Money, rolling in like crazy with no effort on my part, absolutely no overhead, and it was remarkably reliable. Almost $1000 every week, $130 every day, or close to $50,000 a year, probably subject to exponential growth as well. And I just turned off this firehose of cash… over the simple issue of my choice of words on this blog.

$4000 a month is about twice the amount it takes to pay for my entire family's living expenses. It's also enough to pay the mortgage on a $900,000 house, lease several of the world's most expensive cars, buy a family health insurance plan so extreme that doctors would be taking me out for steak and lobster dinners as part of each office visit, or have my family embark on a permanent trans-world adventure. But now, it's gone. And it's all because I refused to remove the word "Badassity" from that banner on the top of the site.

Is that crazy? Perhaps we need to know the history of the situation to judge properly.

Those of us who have been reading for a while know it has been a little crazy since the beginning. I just started typing some shit into the computer in April 2011, and the Spirits of the Internet decided on their own that the blog would become unusually big. I posted a little milestone article after the first million page views, and another after the second million. At that point, I noted that the little advertising boxes on the side of this blog were earning a respectable $500 per month, and that I thought it might eventually grow to $2000, enough to cover the entire Money Mustache family's living expenses, despite the fact that they are already covered in other ways.

Right after that post in March, things got off the hook. I had accidentally stumbled upon the Cash Cow of the personal finance world without realizing it – credit card referrals. The way it worked, for me anyway, is that I got an account at an affiliate marketing company for bloggers and other web publishers. It's called Flexoffers, although there are any number of competing companies. From there, you can cut and paste some javascript code into your own website that generates nice credit card offers for the consideration of your readers. Whenever a reader signs up for a credit card, the blog gets a surprisingly generous commission – often $100 or so.

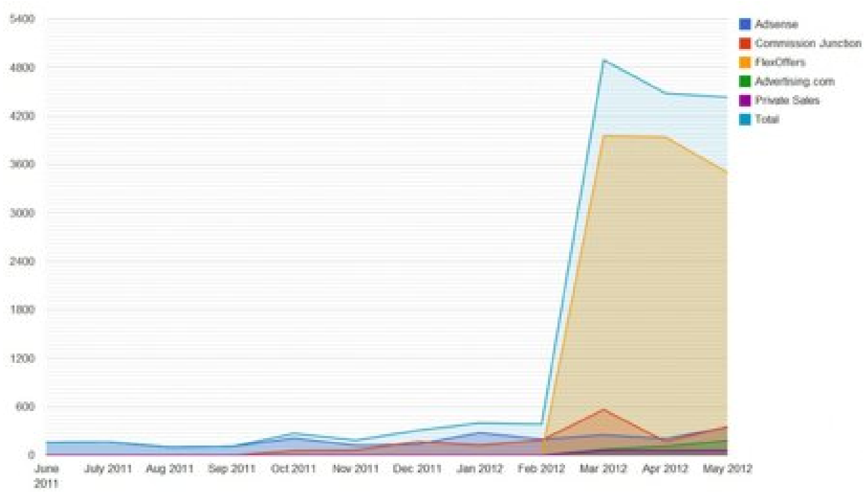
Not being particularly interested in maximizing revenue, I sequestered my own credit card links into a little rewards credit card referral page in the "MMM Recommends" link above*. In the hope of making things more useful to readers, I evaluated each credit card offer myself, and sorted them so that the most valuable offers were near the top of the list. Then I went back to writing articles and forgot about it.

The thing is, the Mustachians who read this blog are a lot like me. They already use credit cards in their daily life. So, shit, if a credit card company wants to pay them $100 or more to sign up for a new card with no strings attached (or $200-400 with some strings you can carefully cut), they'll probably seriously consider it. So as soon as I put up the page, Mustachians started signing up for those cards in droves. I even grabbed a couple of them myself, netting $1000.

In one post near the beginning of it all called "Maximum Mustache March – Update", I mentioned the Chase Sapphire card I had signed up for. That triggered thousands of dollars in sales. After that, the trickle continued at a rate of over $900 a week.

As it turned out, the Chase company had the highest rewards for customers, along with the highest payouts for bloggers. Suddenly over 80% of the blog's revenue was coming just from Chase credit card referrals. "Good for them", I thought, "for finding a way to drastically beat all their competitors, score all the customers, and presumably still make money at it".

I watched my growing Flexoffers account balance warily. Was this ridiculous stream of money for real? Was it really going to come to me? When would it stop? What does a shitload of extra money mean to a man who has already happily realized that he has no real use for way more money? I started planning an article to tell you all about it – you might have noticed the title "This Blog is Raking in some Serious Dough.. here's how" in my list of draft articles. Here's what the revenue stream looked like since the beginning of Money Mustache Time:



MMM revenue (click for larger view)

-

I found it fascinating, mildly addictive, and a bit disruptive. I found myself turning down carpentry jobs that I would have enjoyed doing, solely on the basis of having too much money: "Well, the blog is now paying me $1000 every week. Do I really want to go out and swing hammers and sweat for 25 hours to earn an extra $1000 when the money is even more irrelevant than it was a few months ago? Maybe I should be more like Bill Gates and start doing something involving vaccines in India instead of building yet another kitchen or front porch for someone?

In yet another proof of the amazing power of Hedonic Adaptation, I rapidly adjusted to the new level of income, and felt no happier than I did without it. Possibly even less happy, although there was the odd cheerful laugh at the thought that even the most expensive unexpected life event could easily be swept away effortlessly. But at the same time, I'm old enough to know that effort itself is a key part of happiness, so perhaps effortless solutions are not ideal anyway.

The one thing that didn't change, is that I remained rock solid on my resolve not to inflate my lifestyle beyond its existing level of ridiculous abundance. Adding an even bigger house, newer cars, or fancier vacations would not be in the cards regardless of cashflow.

But then all of this changed in a heartbeat, with the arrival of an email from my friendly Flexoffers representative. To paraphrase his message to me:

> Mustache! We've got an emergency!
>
> Chase has reviewed your blog, and they don't like the banner. It is "inappropriate content" in their view. Also, you should probably change the slogan you created using "WTF!?" as a describing factor for one of their rewards cards.

"Well, shit", I thought. "Didn't we already know this was too good to be true?"

I had enjoyed the irony of this blog speaking out against paying ANY credit card interest, yet receiving huge payments from credit card companies. They were issuing cards to a bunch of highly savvy financial hackers, who were maximizing the rewards while simultaneously setting automatic monthly payoffs from their well-funded ING Direct accounts and Google Calendar alerts to cancel the card accounts just before any annual fees kicked in. If these card companies depend on interest payments to make a profit, the Mustachians were surely a source of losses for them. On the other hand, with the billions of dollars of annual income earned by this blog's readership, there were surely profits to be had in the long run through good business relationships.

So I wrote back to the guy:

> "Tell Chase to read the blog. There's no inappropriate content here. We swear and we rant, but when it comes down to it, we're talking about honesty, integrity, hard work, and becoming very wealthy. There's no reason for a big corporation to shy away from this.
>
> But if they still insist that I remove the word "Badassity" from my banner, then unfortunately we'll have to part ways, because even that small act would be selling out the very integrity that we speak so highly of in this blog.

I felt pretty buzzed after writing that email. Was I really willing to give up all that cash over one word?

But inside, I knew the answer was "Fuck Yeah!"

Because this is really a test of what financial independence is all about. If I give them one word, what do I do when they stumble across other articles like the one called "How Much is That Bitch Costin' Ya?", or the fact that almost every one contains some sort of profanity? If I'm willing to make my own writing shittier just to comply to a corporate monitoring program, then why not just go right back to an office job? After all, I could also make $20,000 unneeded dollars a month as an Engineering manager, and all I have to do is sacrifice all my free time and throw around a lot of buzzwords and kiss the asses of those above me in the hiearchy!

So really, in a slightly irrational way I was hoping that Chase would not see the light and that they would indeed cancel Mr. Money Mustache from their referral program. It would make a great story of corporate cluelessness. A company shooting themselves in the foot due to the incredible bureaucracy that forces low-level people to set aside their own judgement in favor of following a bland rulebook designed to prevent dangerous creativity.

It's much like the media and the big-business blogosphere itself. If you dare to be different from the crowd, you'll pay the price. You won't get the big advertisers, the big sponsorships, or the mild-mannered mainstream media feature stories.

The next day I received a short reply saying, "Chase still decided to cancel your account, since they feel you don't fit with their brand".

So here we are. And it feels absolutely GREAT! What could be a better use of Fuck You Money, then to actually say Fuck You (politely) in a situation where it counts so much? What better definition of the word "Badassity", than the willingness to stand up and refuse to erase it from your own website, even in the face of mind-numbing financial consequences!?

If this blog were the only thing between my family and a homeless shelter, I'd surely be a banner-changin', credit-card-hustlin' fool. Just as the indebted office worker faced with an abusive manager will bow down and do the shitty work, year-in and year-out. Just as the politican without their own cash or grassroots fundraising will sell out to corporate fundraisers every time. Just as the new parent will give up time with her own newborn baby and spend 50 hours a week working and commuting to avoid losing seniority in the company.

Even in this little niche, if you look around at established personal finance blogs, you'll find they have become *credit card selling machines!* I mean shit, Chase just recently introduced a "Disney" credit card. I saw it in my list and deleted it immediately, thinking "Why would anyone want some crap Disney points when they could just have cash?". But it had a great payout, and lo and behold, the PF blogosphere is ripe with "reviews" of the new Disney card.

The world needs Fuck You Money. All of us do. You get it from lowering your expenses, saving your income, and curing your insatiable desire to always have more of everything. Once you get it, you can be freed from the idea of wanting more money when you already have enough.

This will also be a great test of my theory that honesty makes you richer in the long run. I'm tossing aside $50,000 per year in the interest of sticking to my guns. I'm willing to bet that in the long run, I'll end up **even richer** by remaining honest. The best part for you as a reader is that this experiment will cost you nothing – I'll let you know how it turns out.

* *After over a year of being banned, we found a nice workaround that allows this blog to still generate referrals for the good credit cards again. I don't expect this to re-start the gravy train, since I'm not planning to write a big article to advertise its presence. But the credit cards page is back up and useful again. Yeah!*

King for Just One Day

By Mr. Money Mustache

Fri, 29 Jun 2012 02:44:31 +0000

These summer vacations are great. I'm sitting in a 150-year old house in the heart of downtown Hamilton, Ontario and enjoying the steamy warmth of the Great Lakes area, the lush vegetation and well-tended gardens that only our elders seem to master, and some of the world's best home cooking.

During earlier stops on this same trip, I had the pleasure of touring the nicest district of a historic city, drinking new kinds of beer with interesting new people, eating in a stylish Colombian restaurant (who knew those even existed?) zooming along the Chicago waterfront in a brand-new luxury motorboat, and riding around in the fast and expensive cars of various friends. I've even had the chance to spend quite a few hours playing with the latest gadgets – iPads and the Blackberry Playbook tablet, new computers, and a gigantic 3-D television.

All of these things seemed pretty prestigious. Each one of them would take quite a bit of effort and money if I wanted to incorporate them into my own daily life back in Colorado. But while I enjoyed each experience to its fullest, I have no plan to copy any of them. And that's because of a trick I have adopted: I like to call it the "King for Just One Day Method".

You see, luxury experiences are luxurious precisely because they are novel. If you ask a kid who has grown up in a waterfront mansion how excited he is about his parents' house, he will probably describe the experience in pretty mundane terms. As you get used to a new luxury, the fun rapidly wears off. In fact, I can even draw a graph of it for you:

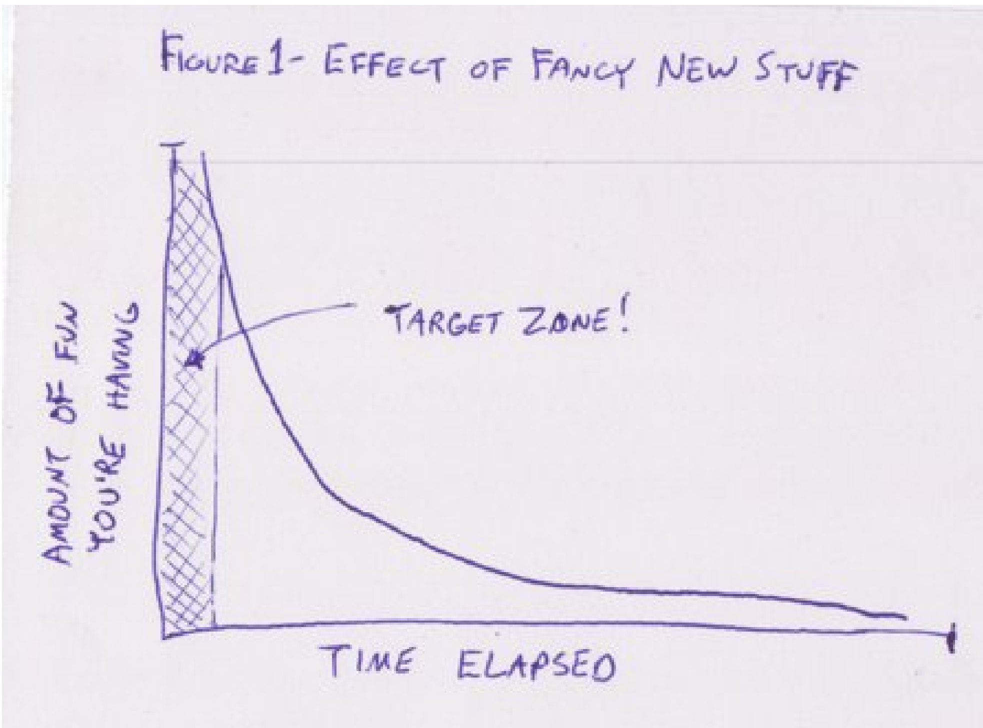


Figure 1: Effect of Fancy New Stuff

As you can see, most of the fun happens right at the beginning. When I bought myself a really fast motorcycle back in 2001, the best riding experience was the first day I took it up into the mountains. If I bought myself that Tesla Roadster I occasionally fantasize about, the peak experience would again be those first few days or weeks of ownership. The fancy boat in Chicago would lose its thrill after the first season, and a fancy restaurant becomes commonplace after a few visits.

But that doesn't change the fact that the initial thrill is pretty exciting. And luckily, in our modern and prosperous world, friendly people like you

Mustachians are likely to be exposed to plenty of those thrills, whether you seek them out or not.

You might end up in a job where you get to take business trips, bringing your fancy gadgets in special bags onto a jet that can take you to beautiful and distant parts of the planet. You might even get to purchase a salad of seared Ahi tuna over a bed of mixed greens with a rich sesami ginger dressing, while your employer pays the bill. Others will get a chance to swim amongst tropical fish in crystal clear turquoise seas, or sleep in the home of a very wealthy friend or family member, enjoying a view or amenities that most of our fellow humans could only dream of.

Even more fun than sharing these peak experiences offered by others, is offering your own. When a friend visits my house for the first time, I'm pleased to provide the insider's tour of some of the world's best snowboarding, mountain biking, brew pubs, and camping and river activities. These things have become commonplace for me, but usually seem pretty amazing to new guests.

The key to making the most of these experiences is to enjoy them for what they are, without idolizing them as a necessary part of everyday life. All of us have got plenty of neat things to keep us busy in life, and if you take a careful inventory you'll see that there are already many options you already have that are going unused.

So when you experience new things that seem better than the equivalent things in your own life, avoid the temptation to copy them. I don't need to get my own new yacht, because I've already raided that Best First Day courtesy of my friend's new yacht. I don't need to buy a seared Ahi tuna salad in a prestigious coastal restaurant every day, because I already enjoyed that initial thrill during a business trip. I don't even need other amazing new experiences every day, because even amazing days would start to blur together if they weren't properly grounded with days of quiet introspection and other days of good old fashioned hard work.

Lower-income people can lose their envy of the rich by learning that a life of constant luxury is not any better than a life of simplicity punctuated by the plentiful novelty that Life automatically invents for us. And rich people can lose their slavery to their own wealth by learning that seeking out constant luxury is like listening to a radio where someone flips from one station to the next every few seconds. Listen to the whole damned song! Then listen to the whole album, and if you can handle it, try making some of your own music!

Write your own list of the Ways that you've Got it Good, and then dig in and enjoy them ALL this summer, before going out to purchase any more add-ons to your already great life.

Hacking Home Depot to Save Big Bucks on Renovations

By Mr. Money Mustache

Mon, 02 Jul 2012 12:00:51 +0000

Nagging Voices of Success, I've made peace with the fact that I'm at my happiest when I get to accomplish something useful at least once every week or so.

So this week, I installed a new set of french doors out to the back patio at my Mom's house here in downtown Hamilton (that's Grandma Money Mustache to you). There was already a set of circa-1992 doors in place, but one of them had partially rotted away due to repeated water and insect exposure. Plus, both doors tended to develop fog between their glass panes in winter. When you add in the fact that this area has a rainy climate with fairly cold snowy winters, we figured it would be quite a significant upgrade to pop in a set of new steel-clad glass doors with energy-star insulation rating and low-E/Argon-filled glass panes, solving all the problems in one go.

When I got to her house last week, GMM had already clipped a Home Depot coupon offering 15% off of all exterior doors. So we decided to start our shopping there. We strategically chose a Home Depot location that was close to a branch of its biggest competitor – Lowe's.

Reviewing the selection of doors in HD, we found what we needed: a 6-foot-wide by 80″ high set of doors, with a left-hand inswing on the primary door. Low-E glass, energy star, the whole deal. Price was $539 before discount. The only problem was that the sole unit in stock had obviously been bought and then returned by another customer. Packaging materials were gone, frame and sill were dirty, screen was missing. So we decided to activate Step One in the Hacking Home Depot plan:

Step One: If possible, find a discountable product:
Look around to find any one-off or returned product that has what you need, then ask a store employee what sort of discount they can offer on the scratch'n'dent unit.

I found the department manager and with no negotiation at all, got $100 off of the door, *and* he agreed to throw in a replacement rolling screen unit from the same aisle, retail price $79.

So together we slid the bulky 150-pound door unit off its shelf and onto our lumber cart. With the rest of the door now visible, I inspected it carefully for damage. Everything looked great (or at least patchable) until I noticed that the specialized bottom weatherstripping was missing from one of the door panels. This was non-standard stuff and would create more than $100 of hassle to replace, so I decided to call off the deal.

Normally at this point, I'd just place an order for a new-condition door with the millwork desk, but since I'm only in town for a few more days, and we had traveled over 10 miles in the construction van specifically to get an in-stock door, we decided to have another crack at finding something. Next stop: the competing Lowe's just a mile down the road.

Heading to the exterior doors department in Lowe's, we found a much better scene. Similar doors at similar prices, but more of the "left hand inswings" in stock. But there was also this one door sitting all alone at the end of the line:

As you can see from the picture, the whole top piece of that door's jamb has come separated from the side piece. Plus the packaging material is gone, it's dirty, and it looks like bad news in general.

But it had an intriguing feature that really appealed to GMM – internal blinds which are sealed between the two glass panels, meaning no need to buy separate blinds, easier operation and no cleaning. The door was also a better-known brand: Jeld-wen instead of Reliabuilt. I did a quick web search on my phone and learned that this particular model of door normally sells for $629. I was now ready to find a store employee and make my pitch.

Step 2: Play the stores against each other:
Not everyone knows this, but Lowe's and Home Depot have a policy of always honoring each other's coupons and matching prices. Got a 15% off coupon for HD? It will work just as well at Lowe's. Found a lower price on an identical item at Lowe's? Take a picture and show it to HD, and see what they do.

So I showed my 15% coupon for Home Depot to the department manager, and said this: "Would you be willing to sell us this damaged door on the end for $529, minus the 15% discount that HD is offering, with another $100 taken off for the damage?". I made sure to ask the question in a buddy-buddy way rather than an entitled-customer way, adding that I would fully understand if he didn't feel it was an appropriate deal for him.

Without blinking, the guy said he would be happy to do so (I find that this happens almost every time, since these stores often have a hard time unloading damaged goods).

From there, things got even better. We started sliding the door out onto the cart. The thing about French doors is that they are heavy glass and steel units attached to a thin and flimsy wooden frame. Without the packaging materials, everything flops all over the place in a very frightening way. Although GMM and I were cheerful and patient with the situation, the department manager became very apologetic upon seeing how “broken” the whole thing looked as we eased it on to the cart, and he offered additional discounts. In the end, he priced the door at **$260,** ***less than half of the regular price!***

On the way out, I happened to notice that both stores were offering “Professional Installation” of French doors for $650 – with a t0-be-determined additional surcharge for unusual situations such as older houses and brick construction. I mentally added that amount to our savings for the day.

The funny part of all of this was that the door system was in perfect condition from my perspective. When installing big doors like this, I always start by unpackaging them and removing both doors from their hinges anyway, allowing precise leveling and screwing of the frame without the heavy doors constantly swinging around and getting in the way. So we rolled it out to the parking lot, took off the doors, pried apart the four pieces of wood that form the jamb, and laid everything into the back of my van for easy transportation. This provided additional time savings, since it normally takes some serious work (and two strong, tall people) to load a double door onto a roof rack and secure it for a long drive and then unload it at the other end.

To make a long story short, I screwed the door frame together from the comfort of the back patio (10 minutes), painstakingly removed the old door system from the rough antique brick opening (1.5 hours), installed the new frame and doors and shimmed, screwed and sealed them in with spray-in foam insulation (1 hour). Then I had to create customized uneven pieces of trim both inside and out to compensate for the fact that the old brick wall was crooked in both dimensions, while doors must always be installed absolutely straight, square, and level in all directions to allow proper operation (2 hours).

Hmm, it looks like this post is morphing from a “shopping and negotiation tips” article into a “do-it-yourself-tips” article, so let’s finish it off with a few pictures of the actual door replacement process:

How to replace a patio door in a brick wall:

Step 1: carefully review your old door – measure the brick opening, the size of the doors, etc. Take off the interior trim and measure the frame in there. Buy a door to match the size, leaving at least 1/2″ of space on each side (most patio door sets are designed to fit within a 72″ x 80″ rough opening).

 

Here’s the old door – with a detail shot of one of the reasons it needed replacing

Step 2: Once you have the new door sitting there ready to install, remove the old one: take old doors off their hinges, remove any remaining trim, pull out any nails, screws, and shims holding the door into its opening, and if necessary, use a saw (sawzall recommended) to cut the old jamb in several places, making it easy to pry out.

Here's the rough opening after all traces of the old door were finally cleared out.

Step 3: With the new doors removed from their hinges, place the new door into the opening.

For 2×4 wood construction walls, put the jamb flush with the interior drywall. For much thicker brick walls, use your imagination to decide how deeply to recess the door – you'll be making your own trim to fill the gap anyway.

Shim the bottom corners to make it perfectly level. Lock in the bottom corner with a nail or screw. Work your way up, making the hinge-side of the door frame perfectly straight and level, adding shims and sturdy screws into the wood and brick. With door installation, the hinge side is *everything*. Then do the other hinge side. Perfectly straight and level.

Now you can hang the door panels back onto their hinges, and shim and adjust the top and bottom jamb boards create a nice, uniform gap. Nail and screw everything well. Check door operation.

Here's the new door. It will look better once it is painted the more subdued brown-grey colour to match the house, but you can use your imagination for now.

Finishing Up: Add insulation around the doors, figure out your own trim details inside and out, then patch, caulk, and paint as you see fit.

In the end, we scored ourselves at least of $1300 of door and installation value (plus single-day installation), in exchange for just a bit of DIY and hack-the-system knowledge, and less than a day of fun work out in the fresh air for me – with a net out-of-pocket cost of $260. This is just another example of why I'm such an advocate of all homeowners learning basic renovation skills. You can specialize and justify the value of your rare brainpower all you like, but unless you have a way to make $1000 after tax in a single day of work*, it's hard to beat the return-on-investment of a little knowhow in the area of maintaining your own house.

* Actually, the equation is probably even more tilted in favor of do-it-yourself, because I have found that hiring a contractor, coordinating schedules, dealing with mistakes and mess, and other fussiness requires you to spend about 4-8 hours of your own personal time hiring out a job like this anyway.

Early Retirement Can't Work, Or I'd Have Heard Of It Before!

By Mr. Money Mustache

Sun, 08 Jul 2012 22:40:02 +0000

Little MM and I marveled at the fanciness of this toy, then went back to digging in the sand with sticks.

Today we've got a guest post from the esteemed Mustachian known as *Arebelspy*, who is also a Moderator over on the Money Mustache Forum. Since we're both passionate about this particular idea, the article became a bit of a collaboration between Arebelspy and MMM.

Mustachianism Can't Work, Or I'd Have Heard Of It Before!

There's a fairly common doubt about the idea of Financial Independence and Early Retirement that MMM and others espouse. Because it's such a prevalent idea that one must work until they're 65, people often doubt that retiring so much earlier than that could even work. The skepticism essentially boils down to this:

> "If early retirement is that easy, why haven't I heard of it before? It must not actually be possible."

MMM has already shown the mechanics behind the idea, in the post The Shockingly Simple Math Behind Early Retirement.

I'm here to explain why most people have never heard of it before.

Today we have a unique opportunity to hit financial independence after only 10 or 15 years of work. Retiring in one's mid-30s sounds crazy, but it is the unprecedented times we live in that makes it possible.

You see, 300 years ago, I'd likely be a toiling peasant. There's no way I could save enough to retire. I'd need to be frugal just to get by.

100 years ago, the situation had improved for some of us, but overall it was still difficult to save much. A frugal worker might be able to save 10, 15, or maybe even 20% of his income, but probably not much more.

The difficulty of saving in the past continues to influence our thinking today: common wisdom suggests that you should be shooting to save those small percentages, because that's what you could save, historically. This makes the 40-90% savings rates suggested by Mr. Money Mustache and his acolytes seem crazy.

But there's a big difference between the economic situation of the average person 100 years ago and today. Compared to our incomes, the basic "cost of living" items have gotten much, much cheaper.

"But wait!", I can hear the complainypants saying. "I hear stories (or remember) when soda was a nickel and a house cost only $5,000!* How can you claim goods are cheaper?"

The actual fact is, due to productivity and technology improvements, wages have risen faster than the cost of goods in real (inflation-adjusted) terms. According to information from the U.S. Bureau of Labor Statistics, real compensation per hour rose from 42 to 108 over the second half of the 20th century (normalized such that the compensation in 1992 = 100).**

This rising standard of living (made possible mainly by productivity improvements through technology) is the reason a Mustachian family can live on barely over $20k per year, even while the US median household income is about double that, and many in-demand jobs pay a single worker several times this amount.

This article from MIT gives a shocking fact that is key to why you can save so much to hit FI quickly. It says that "an average worker needs to work a mere 11 hours per week to produce as much as one working 40 hours per week in 1950."

That means that in theory, the proceeds of the other 29 hours they're working could be saved.

So here's a scenario. Your grandparents, in 1950, could work and save 10% of their income after working 40 hour weeks, and the other 90% of their pay was spent on basic consumer goods. You should be able to do the same, but it'll only take you 11 hours (and you should be able to save 10% of that, like they did, so really only 10 hours) to cover your basic needs. That leaves you with 30 of your 40 hours EXTRA cash that you don't need to be spending on basic cost of living items.

In the 1950s they had TVs, cars, dishwashers, and more. At the time, they thought they were living at the peak of modern convenience with all of the new luxuries – even with a single wage earner.

So what have we done with our over-100% increase in disposable income since then? We've bought even more things. Consumerism.

As a society, we go out to restaurants far more often than our grandparents did. Our houses are more than twice the size, and in expensive cities we've bid up land prices to the sky using cheap credit, negating much of our income gains. We have more cars, we drive them more, and they're packed with more luxuries (imagine going back to 1950 and insisting on a 16-speaker 550-watt audio system in your Chevy!). We also have more shoes, about ten times the amount of clothing (if closet sizes are any indication), and we do much more interstate and even international travel. We tend to buy things before we have the money, adding the significant cost of interest payments to our monthly expenditures. And don't even get me started on the topic of big-screen television sets.

We're flush with more disposable cash than we've ever had in history, but we don't even realize it. The rise of the dual-income household should have made us even wealthier. But instead it just gave rise to the lament, "Nowadays you need two incomes just to get by!"

We should be laughing as we have cashball fights in rooms full of $100 bills. Instead, all we hear is about the ever-increasing cost of living.

The MMM way is to simply roll back the luxury train just a few years, then take all that extra disposable income and save and invest it.

> "But we need all the extra luxury, to compensate for the ever-increasing demands of our work lives!"

Wrong again – even while increasing our income, we've also tripled our leisure time in the last 100 years***. People actually used to spend much more time working, because their work was toiling in fields and factories without the benefits of standardized workweeks, overtime pay, or even weekends in some cases.

So you can work an easy week, still have a good standard of living, still save the vast majority of your paycheck, and hit FI in a resonable number of years.

You haven't heard of this idea because it wasn't possible even 50 years ago. It's still not possible in many parts of the world today. And it may never be possible if you continue to follow the same path as most of your neighbors, who think that a $30,000 car is a reasonable part of a middle-class lifestyle.

But if you live in a first world country****, you're in a unique situation never before seen in history: you can easily hit FI very quickly by saving all that disposable income.

Hopefully this post has explained why you're able to do so.

* No comments about current day Detroit.

To Achieve Greatness, You Must First Acknowledge that You Suck

By Mr. Money Mustache

Tue, 10 Jul 2012 11:00:12 +0000

I’ve got some terrible news for the most dedicated Mr. Money Mustache fans, those strange but generous people who post positive comments here and there around the Internet or in the comment sections of this website, sometimes idolizing the bossy older brother of the FIRE movement.

I, Mr. Money Mustache, am not actually a particularly amazing man. In fact, I suck at many or even most things. Even in the area of early retirement, my primary superpower is simply ***my ability to not buy things***. Furthermore, even if there *are* certain things I do fairly well, there are thousands or millions of people around the world who do them much better.

Yet I’m not disappointed by all of these glum-sounding shortcomings. In fact, I’m downright excited about them. The fact that I’m still performing poorly relative to my potential as a human is actually one of my greatest motivators. And if you choose to allow it, it can be one of yours as well.

Let’s dig in and figure out why:

In our culture these days, there is an interesting type of cancer which affects a certain chunk of the population. The modern word for these people is "Haters", and they're the folks whose comments you see dominating any online news article about anyone who has done something interesting.

A parent who found a new way to raise their kids, a formerly-overweight person who found a way to slim down to athletic proportions, or a person who dared to spend less than they earned and suggest it was a worthwhile thing for others to try. According to the haters, there's always something seriously wrong with the person in the story… *and yet miraculously there's never anything wrong with the haters themselves*.

So we read the success stories, and then we read the criticisms, and we are confused. Should we be inspired, or pissed off? Are the haters the wise, sober realists they portray themselves to be, or are they just assholes?

Thankfully, there's an easy way to sort out the confusion: Ask yourself: **Which group of people is the one getting the good results?**

I have seen this pattern repeated with the many people I've met throughout my own life as well. As with any large sampling of people, there were some success stories and others with pretty serious problems or destructive habits.

But oddly enough, the people in the most trouble tend to be those who claim to have run their own lives nearly perfectly. They always have the very best excuses as to why things are not going their way.

> ***"Man, I've really messed up my back, because I had to work so hard at the office and never got a chance to exercise. And now that my back is messed up, it's even harder to exercise, which is causing me to gain weight really quickly. That messes up my back even further, and … "***
>
> ***"These credit card companies are really ruining my credit. It all happened because my damned employer laid me off right in the middle of a recession. After that, I just went deeper into debt and nothing has gone my way."***

I've had conversations like this while the victims and I were in a seated position, consuming pizza and beer followed by sugary desserts. And yet the problems were still pinned on the oppressive workplace and the bad luck of 'old age' dishing out the lower back injury.

I'd like to suggest a different approach.

I'm not asking the haters and victims to jump up and instantly transform into muscular self-help gurus, ready to start writing books and set out on the public speaking circuit. I'm not even asking them to put down the pizza and start combing Craigslist for a good set of barbells.

All I request, for now, is that they start **acknowledging that they, just like me, currently suck**.

> ***"You know what? I've managed to mess up my back, because I played the mental self-denial game and let myself get weak and out of shape. I spent my days slouching in a chair at work, and I wasted my precious free time watching TV and drinking beer.***
>
> ***I know that in order to maintain an injury-free back I should be doing at least an hour of walking each day, plus some stretching, and a full suite of weight exercises like squats, clean-and-press, and pull-ups as part of workouts spaced throughout the week.***
>
> ***I also know that if I consume pizza, beer, and cookies, I'm going to gain fat very quickly no matter how much I exercise. But I pretended I was still fifteen years old and that my body would forgive me for treating it like crap."***

There. That was a mouthful, and it makes you sound like a loser. But all of a sudden, you're no longer a victim. Suddenly, you've framed the problem entirely in terms of **things you can control yourself**, and thus you can finally make some progress towards solving your problem.

As it turns out, this mental reset is essential to achieving greatness, or even making much progress, in any area of life.

Applying it to myself, I can see quite plainly that I **still** don't look anything like Vin Diesel, I haven't contributed nearly as much to reducing poverty in Africa as Bill and Melinda Gates, and I haven't even written as many articles here on Mr. Money Mustache as I would have liked.

But these sad shortcomings **are not** because of genetic deficiency, or lack of being in the right place at the right time, or being too busy with the demands of parenting.

While these factors could become the seeds of some pretty good excuses, the excuses won't help me get ahead. So for all practical purposes, my shortcomings are simply because **I have sucked so far**, and it's quite obvious that I can do better in all areas.

The challenge then becomes the much more approachable (and even fun) task of figuring out how to do better. It's a matter of figuring out how to increase your self-control and trick yourself into acquiring better habits – slowly but surely. It's a matter of learning just a little bit each day, noting your mistakes and building on your successes.

Without the fake excuse that the outside world is making you a victim, you're finally free to move up in the world.

Next time you're talking with friends about your various successes and failures in life, try an experiment. See if you can detect any symptoms of **Excusitis, the Failure Disease** in the conversation – both from their side of it and from yours. If you have friends who have achieved varying levels of success, see if the level of the disease varies.

If you get a chance, try expressing your hardships in a way that acknowledges the fact that you do, in fact, suck.

You'll probably find that your partner starts to disarm and acknowledge that there is just a small chance that they may suck as well.

And from that baseline of humble and modest suckiness, together you can start to build some real Greatness at last.

Two Fun Tools from the MMM Software Department

By Mr. Money Mustache

Mon, 16 Jul 2012 03:00:00 +0000

Whew, things got pretty crazy over the weekend with that controversial guest post. I'd like to lighten up a little bit with two interesting things that MMM readers have created to share with each other.

#1 The Fancy Graphical Version of the Shockingly Simple Math:

Do you remember that post I wrote a while ago, explaining that the solution to all monetary problems lies in understanding and controlling your savings rate, rather than focusing relentlessly on income? It was called [The Shockingly Simple Math Behind Early Retirement.]()

Well anyway, a guy made a slick and beautiful interactive graphic version of it that is much more fun and intuitive to play with than my article will ever be. It's right here: **http://networthify.com/calculator/earlyretirement**

My enthusiastic thanks go out to 'Kablamo' from London (and I hope we don't crash your web server!).

#2: A Savings Extrapolator Tool that Rewards you with a Growing Mustache:

A famous and cheerful Excel spreadsheet ninja who goes by the name Chandoo created a simple but fun spreadsheet that extrapolates 10-year savings from various expenses you promise to slice from your fatty budget. He probably used the formulas from the antique MMM classic article called "Eliminate Short-termitis: The Bankruptcy Disease". If you just want the numbers, here's what I said:

- to calculate a weekly expense compounded over ten years, multiply the price by 752
- for a monthly expense, multiply by 173

You can see it in action here:

The excel file is here:
http://img.chandoo.org/playground/growing-mustache.xlsx

I hope these clever tools help to spice up your Monday.

Protecting your Money Mustache from Spendy Friends

By Mr. Money Mustache

Sun, 22 Jul 2012 18:48:00 +0000

Mr. and Mrs. Money Mustache have just returned from a very spendy night on the town. The night and the people were lots of fun. But almost equally fun was the sheer amazement and marvel I felt at just how crazy the spending habits of our modern culture are, and how they continue to drift further into the abyss of fantasyland.

Let's start with the facts. We went out for dinner, drinks, desserts and some live music in downtown Ottawa, which is Canada's capital. This city has spent most of the last 20 years in a series of long economic booms, and with the latest one it's starting to look downright glitzy. High-tech companies have been flooding in throughout the 1990s and 2000s, bringing tens of thousands of high-paying primary jobs. The federal government maintains much of its offices here, adding competition for workers. And an irrational real-estate run-up has been going for the past four years, inflating everyone's paper wealth and causing predictable results. The whole city has sprouted that telltale bristle of construction cranes building highrise office and condo towers. To the untrained eye, it sings "prosperity!", although through my own recently-burned shades I see "Real-estate bubble about to pop and cause a huge recession!".

Regardless of the future, what we have right now is a big party. Beautiful and fancy restaurants are everywhere, and they're all packed, with lineups just to get a table. Audis and Beemers idle slowly by in the dense party district, their LED headlamps illuminating the broad torrents of scantily clad legs as they flow across the crosswalks. Designer clothing is stretched tightly across butts and biceps as the bass pumps, jazz floats, and credit cards swipe.

So we show up at the restaurant, and we order ourselves some treats, because it's a special occasion. This is an Italian place, and I don't eat bread and pasta anymore, so I get a nice exotic type of salad and the biggest, darkest glass of beer that they can pour. Good times ensue, and I enjoy my food. My tablemates also enjoy their food, appetizers, entrees, various drinks, and desserts.

The conversation and the laughs are great, although the noisy environment makes it a little hard to hear properly. After an hour or so I'm getting restless from sitting still so long, but thankfully it's time for the bill.

One of the great things about Canada is that it is traditional for restaurants to deliver a separate bill to each diner by default. (In the US, servers routinely mash everything into one bill and leave the people to sort it out for themselves). So I get my own bill:

Fancy Salad: $16
Overpriced Beer: $7
Tax & Tip: $7
Total: $30.

Add in Mrs. MM's similar meal and we're out about $60 as a couple. Then we bought coffee and dessert at another place, spent a few dollars at the pub with the live music, and finally threw the $7.00 we had set aside for bus fare into the car cupholder of a friend who generously ended up driving us home at the end of the night. All in all, a hundred dollars might have gone up in smoke that night. Pretty expensive when you compare it to the $1.00 per meal ideal presented in the Grocery bill article, but still well within what we can afford because hey, we're retired now.

But we were probably some of the cheapest eaters in the restaurant that night. Looking at the entrees page, I didn't see a single dish under $20. The wine menu stretched into the triple digits. Appetizers, desserts, and coffees were readily available to inflate the tab further.

So you'd think that a restaurant like this would only be frequented by very wealthy people. Surely everyone there was already financially independent – free from car loans, home loans, with a 'Stash sizeable enough to fund basic living expenses AND a job they loved which provided enough money to just throw around on hundred-dollar meals.. right?

But no.. those weren't the people in the restaurant. There were my friends, none of whom are retired, and many of whom even wish they had more savings or lower debts! There were other people of all ages packed into the place, and I'd be willing to bet that less than 10% of them could truly afford to eat there, in my own strict definition of the word.

The problem is, the Mustachian definition of reasonable spending (relative to wealth) is pretty different from the average person's definition. If WE ran the world, there would still be decadent restaurants out there for truly wealthy people, but people still stuck in cubes and trying to get ahead would choose more affordable activities for themselves.

Alas, most of us still have non-Mustachian friends, and we don't want to throw them away just for their spending habits. Plus, there is still some fun to be had in the odd restaurant meal or other indulgence. Therefore, you and I sometimes need to compromise in the area of expensive socialization. It's called Protecting your Money Mustache from your Spendy Friends, and it's pretty fun once you get into it.

1: Understand the Big Picture

One of the key differences between being Frugal (good) and being Cheap (bad) in how you handle special occasions. A frugal person may have no problem dropping $50 or $100 on a good time with friends. A cheap person will feel uncomfortable and start looking at his or her feet with even the slightest and rarest of expenditures. The key is in understanding the effect of any spending over the course of a full year, then over 10 years.

For example, the Mustache family enjoyed the recent Ottawa blowout, but we can hardly even remember the LAST time we spent so much on an evening. If you assume it happens twice a year, we're out $200 per year or $2700 every ten years, assuming some compounding. It's solid money, but affordable. But many people I know engage in some sort of downtown happy hour once a week or more, at a cost of $5200 per year or $71,000 every ten. That's serious money, and it was obviously NOT affordable to anyone who ends up ten years out of school and has less than $71,000 in positive net worth to their name. (Because this implies you spent more on restaurants than the combined value of everything else you own in life!). Many of the other patrons of the fancy restaurant that night were surely in that boat.

2: Take the lead in Planning

Why do non-rich people plan their social events at expensive restaurants anyway? Is it because those restaurants are the only way to have fun? Is it because they hate the idea of becoming wealthy? Is it because they're all idiots?

No on all counts. It's simply a habit everyone has gotten themselves into. One person suggests "Restaurant!", the rest of them agree because it's easier to agree than disagree, and the plan is made.

You can override the expensive planning habit by designing more of the events yourself. Dinner or drinks at a rotating series of your own places, a group bike ride, walk, skateboard, or rollerblade event (invent a novel destination), or a meetup in a public park for pick-up soccer or a fitness workout on the kids' play structure. I highly recommend orchestrating an old-school Long-Jump competition if there is a sand pit. For inclement weather, get (or make) yourself a copy of Settlers of Catan.

Find a way to throw a Group Walk into any gathering you design – even if it's just a trip to the beer store or a lap around a few blocks of your neighborhood. Similarly, minimize the unnecessary use of cars (don't organize a hike 60 miles from home and then say "Everyone can just meet out there at the trailhead!").

Besides making you and all of your friends richer, you'll be shifting your group activities from consumption (of needless empty calories and booze), to production (of muscles, fitness, and overall mental wellbeing). They'll also have more fun.

If you've never tried it before, you'll be pleasantly surprised at how willing people are to follow your lead. Most people just go along with whatever is planned for them. On the Ottawa night mentioned above, the Mrs. and I managed to get the friends to replace some of their bar-hopping with a walking tour of the university campus, which stirred up many old memories. Later, I orchestrated a 2-mile roundtrip walk to the music venue (overriding the group's original plan to drive there), which helped to burn off some of the beer and add memories to the evening.

Long ago, I took this concept to the extreme by stumbling into role of social planner for a large company's newgrad and student workforce. With no special skills or social status, I was able to control the leisure activities of hundreds of people – simply because I was the one typing stuff into the computer. Nowadays, I've taken it even further and acquired a more powerful computer.. and in case you haven't noticed, I'm using it to control YOU!

Therefore, you have the power to take control too.

3: Get the separate Tabs – Without Shame
In Ottawa, we attended the restaurant, but chose only reasonably-sized meals. Later that night, we joined everyone in a visit to the Gelato place, but shared a single small ice cream instead of each ordering a separate large one. Instead of a $4.00 Espresso drink, we each had a standard coffee at $1.75. Same amount of fun, lower amount of sugar, and lower bill.

But ordering less costly stuff for yourself only works if you are the one paying your own bill. So you may have to be bold and start a tradition that yes, everyone should pay for their own stuff when you go out. "Hey Guys, I hope you don't mind but I'd like to get my own separate bill for this. These days, I'm eating and drinking less, and saving more, and this is part of it."

If it's a one-off occasion and/or your friends eat the same way you do, you can skip this step, as mentioned in the "Big Picture" point above. But otherwise, shared bills are just injustice, plain and simple. Do we wuss out and put up with injustice, or do we stand up for ourselves? Exactly.

4: Blame Mr. Money Mustache
If you'd like, you can invoke Mr. Money Mustache as part of your justification. I'll gladly take any flak your friends would like to dish out. If you have intelligent enough friends, they might even see the light on the spot, and convert to Mustachianism.

OK, I'm being silly here, but you'd be surprised at how many people I meet these days who had never thought of financial independence in their lives, and yet have now adopted the idea wholeheartedly. It really is a neat and useful concept to understand, and yet almost nobody in the general public has even heard of it… yet*.

5: Embrace the DBP – Drink Booster Program
As a younger man, I was known for occasionally sporting a flask or other hidden container of party supplies, whether the venue be a bar, a restaurant, or a public park. This takes the young adult's dilemma of "I want to get tipsy with my friends tonight, but can't afford the $7.00 drinks", and turns it on its head. You can whip out your flask containing the tasty beverage of your choice, and offer drink boosts not only to yourself, but to all of your friends. They can do the same. This will drastically cut the need to buy overpriced drinks, while adding an element of strategy and intrigue to the evening.

Similarly, you can turn any public park, beach, or campsite into a great meeting venue by bringing your own food and drink. Some public places attempt to post ridiculous "No Alcohol" rules, and although I don't want to get anyone into trouble, I do heartily endorse giving a serious middle finger to conservative societal regulations like that one. Be an adult, don’t interfere with the enjoyment of others, leave the place cleaner than it was when you got there, and use incognito containers as needed… but we should all be able to eat and drink whatever the hell we want while out enjoying Nature.

6: Remember – it’s Being Together that Matters

One of the primary reasons we’re growing rich together here, is to free up more of our time for the rest of our lives. This time will in turn be spent in a mixture of family, friend, and solitary activities. So when planning events, your real goal is to trick people into spending time together. Eating has become our default one, because everybody knows how to eat. But there are so many other things that people can do together, many of which accomplish the goal of togetherness even better. Your job is to understand this, and focus on the people part, while designing out the expensive baggage that has unnecessarily attached itself to all of our social activities.

** Chance that a random person you meet on the street in the US or Canada is a Mustachian: about 1:4000***

*** Update: that was accurate when this article was written in 2012. As of 2016, this number is closer to 1 in 100 in the general public, or 1 in 10 among software workers. So there’s one of us hiding in almost every crowd!*

You’ll Never Be Normal Again: My Terrifying Trip to Dairy Queen

By Mr. Money Mustache

Fri, 27 Jul 2012 12:00:13 +0000

by Mrs. Money Mustache

Once again I am making an unauthorized post on MMM, as he is currently out in the wilderness, far from the Internet. Beware, as this post has not been edited by my better half. Improper paragraph formatting and poor grammar may lie ahead. Sorry honey.

“**You’ll never be normal again**” is the slogan on the t-shirts at TwinFreaks Crossfit. I really like this saying as it implies that you’ve gone beyond Normal into the territory of the Totally Awesome and that this Awesomeness has been triggered by some kind of monumental discovery.

I’m not even close to awesome, but to some extent I was beginning to feel normal in my own little world. In my every day life I’m surrounded by like minded friends. Over time, the people that I am close to have ended up being people with similar values and outlook on life that I have found. Of course, I still run into many that follow a more conventional path, but I only see bits and pieces of these different lifestyles.

And then there's the Mustachians. They just keep coming out of the woodwork and are some of the most motivating and inspiring folks I've met. When you're surrounded by Mustachians every day in comments and in the forum, you kind of start believing that maybe you're not all that different. In fact, you might have a long way to go before you're even close to being as Awesome as everyone else.

My Terrifying Trip to Dairy Queen was my reality check. I am different and in fact, I might be downright weird.

Location: My hometown of Ottawa, Canada.

My parents suggest an outing to the movie theater to watch a 3D movie with little MM. The movie theater is a 30 minute walk away. We drive. No big deal. I'm relaxed about the whole thing.

We get to the movie early and lo and behold, it's quite empty. A nice surprise for a big city like Ottawa! I cringe through a bunch of ads and movie trivia as people start filing in with their giant bags of overpriced popcorn. I'm not even thinking about how anti-mustachian this scene is, because I am enjoying it from a different perspective. I can't remember the last time I was at a super fancy movie theater like this one about to watch a 3D movie. My parents are footing the bill, which is a bonus (incidentally, the cost of the tickets is $52.96 CAD for three adults and one child), and all the Neon and Glamor of this night out is making me feel a bit dizzy and hazy. It's like being at a movie theater for the first time and it seems pretty cool and futuristic. This feeling of experiencing things from a new perspective is one of the huge bonuses of a low-key lifestyle, by the way.

After the movie, we watch the credits and are rewarded by a little bonus scene at the end. This is an MMM family tradition. Almost everyone has left the theater and little MM comments that they "all totally missed out". They sure did. I guess they're on to the next big thing… and so are we, apparently.

My Dad is getting antsy. He has a secret evil plan in the works: A surprise trip to Dairy Queen!! The following ridiculous quotes ensue:

– it's "on the way"
– you always NEED ice cream after a movie, right?
– you only live once
– yeah, there might be a closer one, but this is the one we always go to

We drive and drive and drive (Google maps shows the trip as 4.2 km in the opposite direction of the house with an estimated 11 minute drive time one way). The entire time I am sitting there nearly hyperventilating with every extra minute of driving. My heart is racing and I am getting all stressed out. What is wrong with me? This isn't normal. People go to Dairy Queen sometimes. I've even taken my kid to Dairy Queen once or twice. Why am I suddenly freaking out?

I suppose I had reached some kind of threshold and my happy haze of the night had finally worn off. This little detour wasn't part of the original plan. It's like buying a magazine by the check out line at the grocery store, except that instead of buying it while you're there, you drive 4.2 km to the next grocery store to buy it. It's an impulse purchase and it was being presented as some kind of special treat to my child. But wait, we already had our special treat: The Movie!! Duh.

But wait, there's more.

We finally arrive and I look around. We managed to secure the last spot in a dingy, cramped parking lot. Our headlights illuminate the 50-something couple eating their ice creams in the car parked in front of us. They are staring at us like silent Canadians caught eating ice cream in headlights. It's eerie.

We line up to order. There's a machine that generously takes your coins in exchange for watching the coin take a roller coaster ride into the DQ abyss. The grandparents happily hand little MM a few coins to pass the time. It's a long wait but we persevere. With ice creams and their assorted disposable accompaniments in hand, we proceed to the parking lot to find a seat on the curb. We choose a well lit location next to a giant truck that smells like gasoline, since all the other good curb spots are taken. We eat our ice creams without a word. Little MM is full. I finish his cup and am surprised to find the ice cream tastes like crap. Is this fun? Is this what I'm missing out on? This sucks. Maybe everyone realizes it too, so we decide to head home.

As we're driving home, my Dad turns to me and says: "I just need to make one more stop."

Are you experiencing anti-mustachian anxiety as well? Tell us your story!

Managed Payout Funds: Automatic Grocery Buying Machines for the Early Retiree

By Mr. Money Mustache

Mon, 30 Jul 2012 22:23:40 +0000

So let's say you suddenly have a million dollars, and you want to put it to good use.

As a Mustachian, your first instinct would naturally be to invest the money somewhere, in such a way that it provides reliable income to you for the rest of your life. Thus, you would be Financially Independent, and all future decisions of what to do with your time could be made independently of whether or not you get paid for those activities.

But how do you invest a chunk of money, such that it provides this reliable income without running out? If you just pull a few garbage bags of cash out of the ATM and hoard it at home, inflation will destroy its purchasing power over the course of your lifetime, and you'll spend your last few decades in relative poverty.

You can put it in a savings account at your local bank and earn 0.1% Maybe you'll get as high as 0.8% at a more modern bank like ING Direct.

Forget it. For large sums of money, a savings account is little better than storing it under the mattress these days.

You can use certificates of deposit or government bonds. Some of these pay 2-3% in exchange for locking up your money for a very long time. You might keep up with inflation, but only if you reinvest all the interest payments, leaving you with nothing to spend.

Many early retirees have turned to owning rental real estate, because it provides a much higher annual cashflow (10% or more is possible), even while the core asset (the houses or apartment buildings), tends to automatically appreciate with inflation. But not everyone has the patience or the interest to be a landlord – even with the option of hiring a property manager to handle the day-to-day operation of the properties.

Real Estate Investment Trusts (REITs) encapsulate many of the benefits of rental house ownership, with fewer drawbacks and absolutely no work. The downside is that your money is still concentrated in one potentially volatile asset class (usually commercial buildings), the tax treatment isn't nearly as good, and the yield is lower than owning your own property.

While the real estate options sound good, most diehard investors (myself included) feel safer not having all of their eggs in one basket. After all, real estate is only a tiny slice of the world's economy, so it makes sense to own parts of all of it instead. Because of this, I try to maintain a more diverse "Asset Allocation" that includes plenty of good old-fashioned stocks.

"Stocks!", you may say. "But how do I fund a retirement with stocks, when they're always jumping up and down? Won't I lose all my money when I'm forced to sell low?"

In a word: No. Stocks make a great companion to the early retiree, even when your goal is a steady stream of income.

First of all, by owning index funds, you'll automatically own a large number of companies that pay regular dividends. This generates a stream of payments that can show up automatically in your bank account on a predictable schedule.

The problem is that dividend yields aren't all that high these days. Despite the fact that US stocks seem reasonably priced these days when judged by historical standards, the dividend yield is much lower than it was in previous decades. You can blame this on a cultural shift in investors: many of us prefer to have companies re-invest more of their earnings, or repurchase their own shares (multiplying the value of the shares still in the hands of shareholders), instead of paying us their earnings in cold sweet cash. This helps lower the tax burden of owning stocks. I'd prefer higher dividends myself, but I've heard from many who like the system how it is now.

So your stocks will in theory go up faster than inflation, even after paying you dividends. But how do you extract this extra value from the stocks, without manually logging into your retirement account every month and deciding exactly how many shares to sell?

One answer is the **Managed Payout Fund** – which brings us to the real point of this article!

As it turns out, my old standby Vanguard has at least three funds that do exactly what we're talking about here. You throw in some money up front, and they handle asset allocation and payout, automatically managed with a reasonably low expense ratio.

Depending on how much of your 'Stash you want to spend each year, you can chose any of the following three funds:

- **VPGFX** pays you 2.7% per year: https://personal.vanguard.com/us/funds/snapshot?FundId=1497&FundIntExt=INT
- **VPGDX** pays 4.7% per year: https://personal.vanguard.com/us/funds/snapshot?FundId=1498&FundIntExt=INT
- **VPDFX** pays 6.8% per year: https://personal.vanguard.com/us/funds/snapshot?FundId=1499&FundIntExt=INT

“So what is really inside these funds, providing the great returns?”, you may ask.

First of all, don’t confuse payout with actual return. While the fund values will tend to grow with the world economy, the payout amount *may* turn out to be larger than the growth, slowly draining away your principal.

In fact, VPGFX is likely to be the fastest-growing (and most volatile) fund based on its asset mix, even while it has the lowest scheduled payout. The idea is that younger people would use VPGFX, and older would buy VPDFX.

With that caution aside, let’s look at the actual contents of the first fund in our list, just to get an idea of what’s inside.

- Vanguard Total Stock Market Index Fund Investor Shares 45.8%
- Vanguard Total International Stock Index Fund Investor Shares 19.5%
- Commodities 10.2%
- Vanguard REIT Index Fund Investor Shares 10.1%
- Vanguard Market Neutral Fund Investor Shares 9.7%
- Vanguard Total Bond Market II Index Fund Investor Shares†† 4.7%
- Total — 100.0%

Aha – from their description we can see that it’s a nice mixture of other Vanguard funds, automatically maintained in a roughly fixed ratio. Very diverse, which means much more stable than an all-VFINX (US stocks) portfolio.

Their stock/bond mix changes to become more conservative as you move down the list – suggesting the older you get, the further down you go. You’ll get even more stability, in exchange for lower expected returns (even as the actual payout increases).

Thus, the highest-payout fund would be likely to draw down your principal faster than inflation over time (unless we see great stock/bond returns from this point on, a little unlikely given that bond prices are already high, which is why yields are almost zero). So you wouldn’t want to count on a lifetime of retirement with, say, $300k in VPDFX, unless you had some nice safety margins elsewhere in your life.

But if I had to take a big chunk of money and convert it to a relatively safe, stable source of lifetime income by making a single investment, I'd feel pretty good about just throwing everything into VPGDX, and simply enjoying the 4.7% annual paychecks for decades to come. For those who just want a single easy answer, a managed payout funds like these can truly become an Automatic Grocery Buying Machine that funds your Early Retirement. Even if you prefer the lower expense ratio and greater control of buying your own selection of index funds, following the allocation ratios set out in these funds represents a pretty good starting point at sensible investing.

Bonus Info:
Every time I write about my love for Vanguard funds, Canadians ask me if there's an equivalent available to investors in Canada. This is an important question, since expense ratios for Canadian mutual funds (called MERs) are often ridiculous, 1-2% annually or more. In a world where you're only earning 7% total, this means your fund company is siphoning off up to a quarter of your total income! Therefore, you should be looking for the lowest fraction of a percent possible, and laughing at anything over 0.5% or so (most of my own funds charge well under 0.2%).

A few answers:

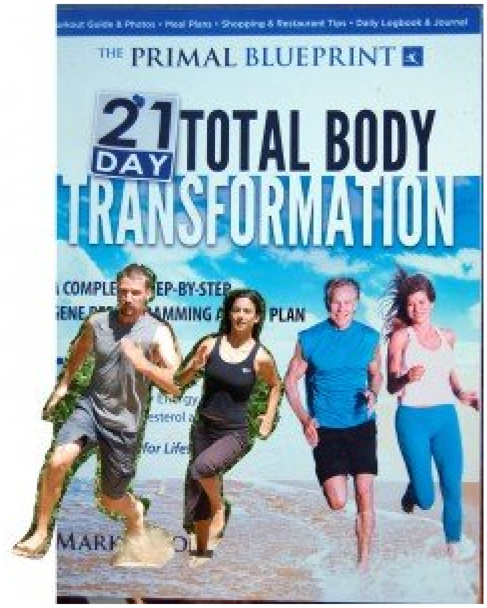
Vanguard Canada is now offering some low-fee ETFs on the toronto stock exchange. Although they are not managed-payout funds, you can still create a nice porfolio from them, collect dividends, and sell off shares as needed to fund retirement.

TD's e-series funds are another competitive source for Canadian investors. MERs are among the lowest in the country, and the funds are no-bullshit index funds. This allows you to steer clear of traditional mutual funds, which underperform even while overcharging. It also allows you to invest without a financial advisor or stock broker. All funds can be bought directly from TD or Vanguard without commission.

Mr. Money Mustache vs. Mark's Daily Apple

By Mr. Money Mustache

Tue, 07 Aug 2012 17:33:39 +0000



[The Mustaches and the Sissons, sprinting it out in Malibu, CA.]

A couple of months ago, I was relaxing in the Mustache Lounge and an interesting email came in. It was from the editor of a major blog called MarksDailyApple.com, which I had heard of but never really followed.

As it turns out, this guy was also an MMM reader and we had a great conversation about writing blogs on topics which tend to go against conventional wisdom. But even more fateful was the fact that he offered to send me a few books from author Mark Sisson, the original "Mark" behind that Daily Apple website and the employer of my new friend.

"Yeah, yeah, free books" is what you normally say in that situation. It's flattering to get free stuff just because you have a blog, but I normally don't accept the offers because I already get all my books for free – at the Library. Combine this with the fact that I already have a long queue of things I need to read, and the fact that free books are in general sent in hopes of getting free promotion from bloggers, and you can see why I don't usually accept the gifts.

But in this case, I thought it could work out well. I was about to leave for the giant annual trip to Canada (a trip we're just wrapping up this week, actually), and I figured it would be handy to have some more reading material on vacation. Also, the guy offering was a really interesting and genuine person, and the subject of health and fitness is one of my favorite to read about. So I requested that the books be sent to the address where I'd be staying in Canada, so they'd be there waiting for me when I arrived.

Then over the next two weeks, I forgot about the whole arrangement. I drove alone across the country, had a chance to meet many new interesting people, and had some neat experiences.

Eventually I arrived at my final destination in Ottawa, and found that my new books had been opened and were in active use. My wife and in-laws were eating differently, novel exercises were being performed, and both motivation and fitness levels were looking pretty good, by vacation standards. Occasionally I would hear the unusual phrase, "Hmm.. I wonder what Mark Sisson would think about this choice? Is it Primal?"

I had to figure out what all this was about, so I dug into the thickest of the three books, called "The Primal Blueprint". And I'll admit, even as a jaded fitness book junkie who thought I wouldn't see anything new, I found it pretty interesting. And here's why.

The Primal Blueprint is all about living a simpler, more powerful, and healthier life. The idea is to be inspired by the Badassity of our pre-agricultural human ancestors, who were actually just as clever as us and far more physically fit. In fact, if you adjust for the higher infant mortality of primitive times and the vastly higher danger of early death from infection and accidents, these people lived almost as long as we do now, and kept in much better shape throughout their lifespans, typically avoiding heart disease and cancer.

So the idea is that you can take the best of a primitive lifestyle, and incorporate it into your modern one, to get the best of both. In practice, this means thinking about our evolutionary past and sticking to foods and activities that are compatible with what we evolved to thrive on. Moving around all day, spending most of your time outside, and eating plants, nuts, organic meats and a generally low-carb diet: yes. Sedentary lifestyles, TV, refined carbs and grains: not nearly as much.

Mark Sisson suggests that we all live more laid-back lifestyles, walk around with bare feet whenever possible, let our bodies be forced to adjust to the climate around us, exercise moderately but with occasional heavy lifting and sprinting, and basically forego as much of the modern blare of flashy digital entertainment as we can stand to do. In exchange, he suggests that you'll have a much easier time maintaining an excellent level of fitness, and you'll become happier and more productive and live much longer as well.

I'm sure you're starting to see why I like the message. This stuff sounds awfully similar to Mustachianism itself. Over the past 1.3 years, Mr. Money Mustache has taken away your TV, made you live within biking (or walking) distance of work, taught you to get more of what you need from Nature, cut down on your purchases of unnecessary gadgets, told you to always put Muscle over Motor, and even drawn inspiration from another primitive culture of Badassity, the Native Americans. I took away most of your Air Conditioning privileges (never cool your house below 82F), arguing that it is better to make the most of your body's natural adaptability to changing temperatures rather than wasting electricity just for the benefit of remaining a Climate Wuss.

In short, I too want you to live like a Cave Man or Cave Woman. You'll be a well-educated and socially conscious one with Internet access, but in general you will be reaping the enormous benefits of this simpler way of life, with the six-pack abs and Giant Money Mustache to show for it.

The Primal Blueprint book is far more focused on nutrition than this blog, and I enjoyed the different perspective. For example, if you believe the studies cited in the book, dietary cholesterol intake has nothing to do with blood levels of "bad cholesterol" and heart disease . In fact, it is the excessive insulin production caused by high carbohydrate intake from grains and sugars that causes most of the lifestyle diseases we see today.

A recent breakfast, enjoyed outdoors at the Mustache-in-Laws.

In other words, the book suggests that having a giant plate of bacon, eggs, and avocados (all organic if possible) is a far healthier breakfast than a few slices of whole wheat bread covered with some modern low-cholesterol spread.

It's far from conventional wisdom, but it actually aligns almost perfectly with what the "Paleo" eating crowd has been preaching. And from my own non-scientific experiments on myself, I have to weigh in on the side of the low-carb eaters.

I've dropped bread and most grains out of my diet over the past year, just to see what would happen. It's a huge change, since in my 20s I was an avid low-fat follower, avoiding most oils and eating plates of spaghetti and drinking mugs of skim milk with protein powder even as I did long weightlifting workouts 3-4 times per week.

The results have surprised me. I eat rich oily foods now, and do much shorter workouts. But with very little effort I've lost almost all the extra fat I had been carrying in the earlier years. Energy levels are better than ever. Even more interestingly, my body seems to regulate its own appetite much more easily now. Instead of requiring 6 small meals per day, I now tend to eat a big greasy breakfast, and not need food until much later in the day. On active days, appetite scales way up. On sit-at-home days, I need much less food. In the event of food shortage, the body has become very good at just using stored fat, making the belly fat reserves very easy to control at will ("Sorry, Metabolism, no food available right now, but help yourself to those Love Handles over there if you're hungry.").

These are all things advertised by lower-carb advocates, but I just happened to stumble on them myself earlier this year. Pretty neat.

But the neatest part is how the ideas of the Primal Blueprint also apply so readily to the field of becoming wealthy enough to retire early, the primary focus here at Mr. Money Mustache.

Mark Sisson correctly recognizes the natural badassity of our ancestors and harnesses it to whip all of his followers into shape. If you follow the advice, you'll have a nice body and a healthy mind. But you'll still be locking those fine assets up in a cubicle all day, so you can earn enough to buy $100 steaks at Whole Foods and make the payments on the giant SUV you use to drive to the forest for hikes.

Mr. Money Mustache simply keeps going with that set of ideas, and teaches you to apply them to your spending as well. By embracing rather than running away from simpler living and heightened challenge, you can learn to save 50-75% (or more) of what you earn, while coming out happier than you were while spending much more. Don't be fooled into spending lavishly to attain a healthy and primal lifestyle. It's all around you – you just have to take off your shoes, run outside, and grab some of it.

-

Many thanks to Aaron at Mark's Daily apple and to Mark Sisson himself for working to share such a useful message.

Seven Weeks of Homelessness

By Mr. Money Mustache

Mon, 13 Aug 2012 23:33:04 +0000

At last, the Mustache Family has returned home to the plentiful comfort of the USA.

It was a record-breaking trip in both the Fun and the Extreme Duration departments: a full seven weeks elapsed between the time we left and the red-eyed return to our driveway after midnight last night. So many things happened that it felt like a whole separate lifetime. I lived a truly nomadic lifestyle, surfing between beds, couches, and floors in at least eight different locations, with at least 20 moves between them.

So it's a very pleasant, but strange feeling to be back home in my real house. All these big, empty rooms, and all this stuff I had forgotten we even owned. On the positive side, it's nice to get a break from the *Chronically Overcrowded Fridge Syndrome* that seems to affect almost everyone in both sides of the MMM extended family. On the negative side, we all miss our families already and it will be months before we see them again.

The part that was most amazing about the trip was that we were all truly happy – just as happy as we would have been here at home. From a practical perspective, we gave up our fine house and all of its contents, sacrificed our nicer car and all seven bicycles. I lost my drums and guitars, and my son lost all of his favorite toys. Mrs. M gave up her closest friends and the joy of regular self-inflicted pain at the Crossfit gym. I also gave up the entire United States and all of my monetary fortune, since I didn't visit this country or spend much of anything while I was away from home.

In fact, the life that we led on that trip was almost exactly the one we would lead if we lost *everything* except the clothes on our backs. I lived entirely out of a small duffel bag of stuff. My only high-tech toys were my homemade construction radio and a clunky old laptop I got for free from an

MMM reader [back in March](). I didn't even need my own shoes for most of the trip – summer-toughened bare feet were the primary footwear, and an old pair of sandals was a close second. While I enjoyed mostly free meals and accommodations, I paid back more than their value in most cases by doing construction projects for my hosts.

By the end of it all, as I was packing up my little duffel bag for about the 50th time, I thought about the simple life we had led and realized that you really don't need much to be happy in life. As I had long suspected, the supposedly-frugal life we lead back in Colorado is still far more than one needs. And even the duffel-bag lifestyle described above could surely be pared down even further. A beach, a coconut tree, and a fishing rod could provide just as much pleasure, especially if there happened to be a library nearby.

But now the magical simplicity of the summer life is over. I'm in a fully equipped home office, there's a huge to-do list taped to the side of the monitor, and the school year is starting up for my little son in three days. The amazingly fancy things I own at home are already starting to put me into the mood to buy more things. The car looks like it could use some new tires. An ultrabook laptop would look nice on my lap this fall as I get back into some serious blog writing. More outdoor-living projects beckon in the back yard. The more things you have, the more there is to be tweaked and optimized and improved upon.

So the MMM family will probably go back to normal life, and resume the process of buying things occasionally. It won't be the typical rich household's spending, where cars circle the town daily, harvesting bags and boxes of luxury products at the slightest whim of their owners. But it will still be at least 75% optional spending, which is an important thought to ponder. My job is to capture the feeling of this simple, blissful summer and apply it across the rest of the year. I already know what it's like to be happy with much less stuff.. so what's stopping me from accomplishing it in my real life? What's stopping you?

…

It’s great to be back. Let’s have some serious fun this year as the MMM blogging season gets going at last!

What it Feels Like to Become Rich

By Mr. Money Mustache

Thu, 16 Aug 2012 12:00:03 +0000

Overheard in a Reddit forum recently:

> Dear forum,
>
> I feel a bit stuck. I've got a solid job, I'm making 401(k) contributions, have no debt and my spending is under control. Making extra mortgage payments and buying a bit of Vanguard index funds with any money I have left over. I drive a fuel-efficient car with no loan, and I read far too much about personal finance online. Mr. Money Mustache writes articles, I nod my head and say "oh yeah baby, that's right!" at most of what he says. I already know all this stuff, so I'm getting a bit bored. Am I doing something wrong? What's next?

As I read that person's words, some deeply familiar feelings were stirred up from my own working days way back in the 2000s. I remember the same plateau of monetary doldrums, which lasted for several years. Many of you Mustachians might be traversing that same plateau right at this moment.

Relationships to money are an odd thing among humans, especially in the current era of extreme debt.

Many (perhaps even most) of the current US population wrangles with money like it's a fiery serpent. There's never enough of it. It provides jolts of great pleasure and relief as it fetches us really big new televisions, or allows us to buy our way out of unpleasant situations like an uncomfortably hot house, a lack of home-cooking skills, or an outdated car. But it also provides decades of constant background stress, as bills and expenses pile up, desperately-needed job income is interrupted by layoffs, and interest payments drain away a good portion of the fruits of our labor.

For others, money is a source of flashy power. Some high-income people are able to meet their basic needs very easily, plus buy the TVs and air conditioning, and are still left with more. So these lucky folks can also add a vacation home, a yacht, and really high-end travel. With sufficient income, they can even do all of this without getting too deep into debt. Their money defines them – they can buy their way into, and out of, anything. And they may even be quite happy, as long as the stream of money remains plentiful.

Then of course there are countless other relationships, from poverty where money is so hard to come by that even basic nutrition is tough, to nearly infinite wealth, where any level of spending could never deplete the family fortune.

And then there's you and me. We're working away, running our lives with a certain level of efficiency. Makin' the Dough and we be 'Stashin' it / Neva' see us Flashin' or Trashin' it / Takin' that check home and Cashin' it. The salary comes in. The credit card automatically pays itself in full via automatic withdrawal each month. Automatic investment transfers do their thing, and we sweep the considerable surplus to additional investments whenever the bank account gets above $3k or so.

It's all on auto-pilot, and all there is for us to do is go to work during the week, and pack some fun into the weekends. There is no drama in your financial life. Many people would kill for a situation like the one you're in.. but yet you're bored. What is wrong with you?

Congratulations. That odd, slightly bored feeling you have is ***the feeling of becoming rich*** .

It's a bit anti-climactic, isn't it?

I hate to be the one to deliver this news to you, but a wealthy person's relationship to money should actually be pretty boring, if you are doing it right. You're on a very short road that leads straight to financial independence. After that, work will be optional and money will become simply an appliance to you. Like clean, drinkable water from a tap, it is essential to basic life, but it fades into the background once you have enough of it.

It will be there to help you out whenever you need it. It is reassuring if you're a naturally worry-prone person (like I tend to be). You can be creative and use it for generous purposes.

But it also must be used with discipline. Unlimited money can be like a video game on cheat mode. It can drain the challenge from most areas of life and leave you lazy and paralyzed. You'll be pressing wall-mounted buttons in the throne room of your 787 to summon personal assistants to brush your teeth and change your socks for you.

Even the best intentions can lead to disaster. My first roommate in Colorado was a trust fund student whose father was the CEO of a Fortune 50 company. The dad lived on a 40-acre compound in the country with a historic stone mansion within limousine commuting distance of Manhattan. The young man was an enormous brat, drunk-driving between the Denver clubs and taking dinner with a side dish of cocaine as he waited for the next allowance check to arrive (and eventually a $5M gift when he turned 21, which would allow him to forego renting out rooms in the Boulder luxury home we shared with two other people). He had never had a job and never planned to get one. The lesson? Giving money to your kids is not necessarily a blessing.

On the positive side, I still maintain that becoming somewhat wealthy is a worthwhile pursuit. Responsibly managed riches are great because of the freedom they can provide. Hopefully not freedom from discomfort, occasional inconvenience, and great challenge – those things are so good for you that it would be a shame to give them up. But freedom to use your time and energy in the most life-improving way you can dream up. Freedom from working the same repetitive job for most of your waking hours during the best decades of your life, just to pay the bills. That's a freedom worth buying, because it's almost like buying more of life itself.

Sure, if you love your work and you plan to do it until the day you die (and you're sure this situation won't change later in life), there may be no need to buy your freedom with money. But heck, we've already demonstrated that financial independence is pretty easy to attain. So a cautious guy like me is naturally apt to hedge my bets by earning the freedom early in life, allowing the love of work to go on without the pressure of financial matters lurking in the background. This allows things like dedicated childraising, long vacations, or low-paying artistic pursuits to become real options. Just in case your current youthful love of running a law firm, performing heart surgery, or writing cutting-edge software ever wears thin in your later years.

So, your financial boredom will probably continue. Keep up the good work.

And better yet, get used to it: this excessive calm you are feeling is the base upon which you will build your new life. Once you have flushed out the false excitement of consumerism, a busy career, and financial drama, you get to create an actual life for yourself instead. What do you really want out of life? What things make life most worth living? Try the inexpensive and challenging things along with the usual pricey ones and see which ones really make you happy. Make a note of your results, and keep experimenting and improving whenever you can.

Welcome to the world of the rich!

Two Great Paychecks from the Mustachians

By Mr. Money Mustache

Sat, 18 Aug 2012 23:00:34 +0000

There’s a big, hidden part to this job of being Mr. Money Mustache that you don’t get to see every day: the stream of really neat emails that seem to constantly arrive.

These letters from readers are as interesting as they are varied. Some of them I read aloud to Mrs. Money Mustache, or to my son, or to friends. Although I only get a chance to respond to about one in ten, they’re inspirational to all of us, and I like to think of them as fine, sparkly paychecks that I get for writing this blog.

The main reason I write this thing is in the hope of inspiring a bit of social change. Improvements in our way of life by shifting away from buying and wasting, and towards learning and sharing with other people. With unusual wealth just being a convenient byproduct. So when I read that people are actually putting this stuff to use in real life, and getting great results, it makes it all seem so much more real, and worthwhile. So thanks for those letters.

With that introduction, here are just a couple of interesting ones that came in from beloved Mustachians recently:

Letter 1: Avoiding a Lifetime Habit of Commuting

Comments: Hello Mr. Money Mustache,

I am a just-out-of-college, single, working, commuting woman with debt and a full-time job. I was beginning the job search for something closer and got offered a job. I did not necessarily like the job offered to me, so I thought, why don't I just stay at my job for another year and see what I want to do after a year of commuting?

I googled, "is commuting worth it?"

Your blog post about the truth of commuting was one of the first options on the list given. I read it from top to bottom and I will never be the same. It shocked me that the cost of commuting was so high. I have grown up in a suburban neighborhood where everyone always commutes. Everyone does it. That's just what you do…at least I thought. Never did I factor in the cost or the price of the time wasted.

Thank you for your inspiring post. I look forward to reading more as they are written! Hopefully your posts will help me get out of college-debt as well…if you've got any advice, I'll take anything you've got!

I've decided to take the closer job (4 miles away instead of **an hour** commute one way) and buy a bike! WOO!

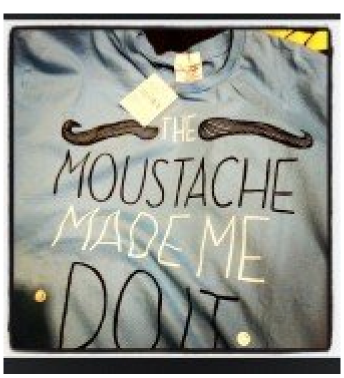


Photo credit: Matt

MMM Comment:WOW!! Avoiding this one-hour commute alone will save her about $75,000 every ten years in direct costs alone, or *several hundred* *thousand dollars* after factoring in the value of the time wasted. And that's *every* ten years. All from one blog post? Astounding.

Especially when I look at the stats for that article and see that at least 103,000 other people read it on this site, plus ten times as many on the bigger sites that posted it like Lifehacker. The era of the long car commute MUST DIE!!

Letter 2: The Log-Cabin Mustachian

Comments: Dear MMM,

You have inspired me to submit to you my three favorite ways of being frugal:

My wife and I are really good at not spending money. We live on quite a bit less than $2k a month and have three sturdy, round-faced little brats.

Frugality is an important virtue to practice when you are a farmer and a musician, respectively. A taste for rice and beans six nights a week is also helpful. If I were more willing to learn the song "Freebird," we could probably scale back our rice and beans intake to five nights a week, but alas, I have principles.

I say we are backwards Mustachians because we both grew up in families where consumerism wasn't an option. I had nine younger siblings. My wife's father saved money by buying expired meat at the store that was labeled "crab bait" and not using it for crab bait.

So we've always found it easy to live below our means – we've never had the means to do anything else. In fact, only recently have we had enough means for credit card companies even to be interested in us. We're still working on the Mustachian practice of making lots of money and not spending it. We've got the "not spending" part down. I will keep reading your blog to help me figure out the other part.

But here are my 3 favorite ways of not spending money that I think Mustachians could appreciate:

1. Chopping my own firewood to get buff and heat my house

2. Having very nice neighbors who own tools (we owe them a lot of pies, but no money.)

3. Living in a nice house that I built for $30k in 2 years with no loans.

I'm not sure if #1 works in Boulder, but here on the west side of the Evergreen State it's lunacy not to heat with wood- because it's everywhere.

Our electric bill is $50 to $80 a month. Splitting and stacking firewood is great exercise and a full wood-shed is very satisfying thing to behold. Also, fresh chopped wood smells great.

Processing firewood is also a great neighborhood activity, after which, beer tastes wonderful. Making firewood saves more than electricity- it saves you the cost of a gym membership and I think it might save coal in some part of the world- though I am no expert in that department.

#2 is somewhat blind luck, but good relationships with helpful neighbors can definitely be cultivated, (or squandered. Non-monetary debt can be abused. I admit that I may have tested the line here on occasion.)

#3 is something Mr. Mustache probably knows more about than me, but every house has its own story and here is ours, briefly:

We built our house out of boards, beams, nails and "Simpson Strong Ties" and we own it. It even passed inspection – so we're legal.

I used a lot of salvaged “free” lumber and other materials which were great, but time-consuming to collect and figure out how to make work. But these materials also give the house more quirkiness and character.

For example, every visitor to our house raves about our bathroom sink which my wife found at an auction for cheap. It is very colorful. A joyful sink. If it had come from Home Depot I doubt it would inspire that kind of enthusiasm from our visitors. My kids, however, are happy spitting their toothpaste into any handy receptacle.

Our house is wonderful to live in, even if I see a few of the boo-boos I made during the building, every single day. It is easy to heat with our wood stove. We incorporated an "inefficient" cathedral ceiling in our design which we have made efficient by stringing an indoor clothes' line up there – eliminating the need for a clothes dryer.

Since we paid for all the materials out of our own shallow pockets and with $10k of generous gifts from family, we own it outright and have no loans to pay off.

The county values it at $120k. Since we spent $30k building it, you could say we made $90k building it ourselves. It was a very fun and satisfying way to earn $90k – even though it took us two years to build.

(Not two years of full-time carpentering mind you, but two years on the calendar. We also did other things to earn actual cash during this time. It would have taken me more than two years to earn $90k playing guitar gigs at the time, I can tell you.)

Now here's the trick, since we took out no loans to build the house and it is all paid for, could we say that we earned a lot more than $90k? How would we figure the interest not paid on this deal? Perhaps you could help us out here Mr. MM.

I would like to think that we did better than a measly $90k, but I'm not sure.

MMM Comment: you are correct! For most people to amass $90k of home equity, they have to earn a much larger amount, then pay taxes, pay for their living expenses, battle the backwards treadmill of mortgage interest, and only at that point can they pay off principal of the mortgage. For most, it takes many years and several hundred thousand dollars of earnings to accomplish this.

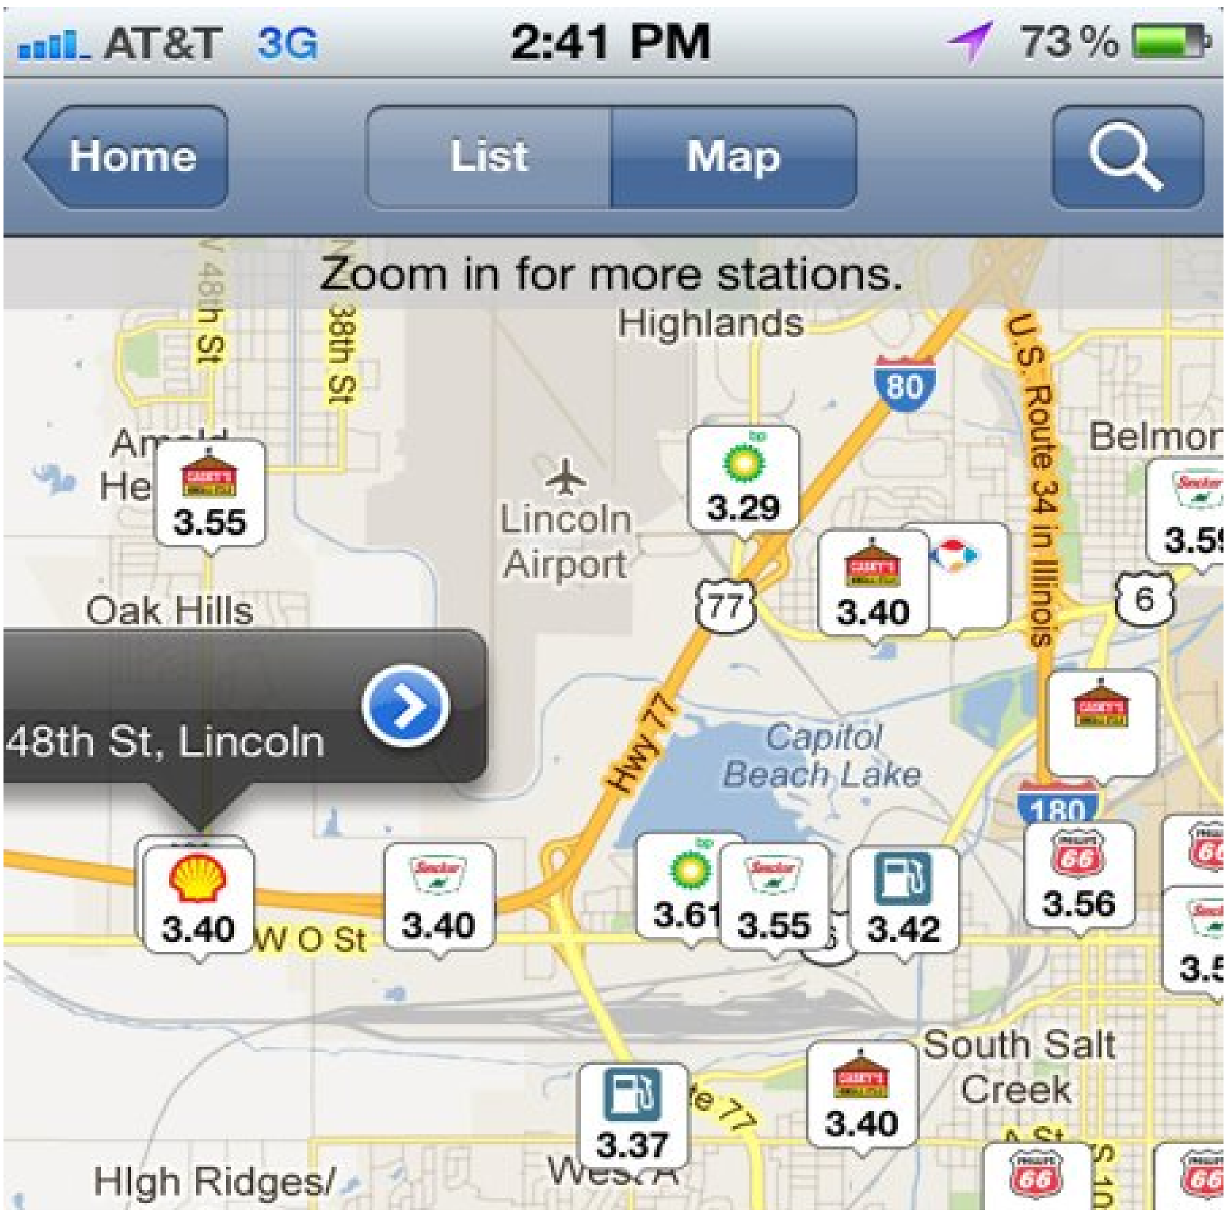
You did it in just two years, while also working your regular jobs. That means you outpaced most $200k earners during those years, or leapt ahead more than a decade towards financial independence compared to most people with lower incomes. Congratulations!

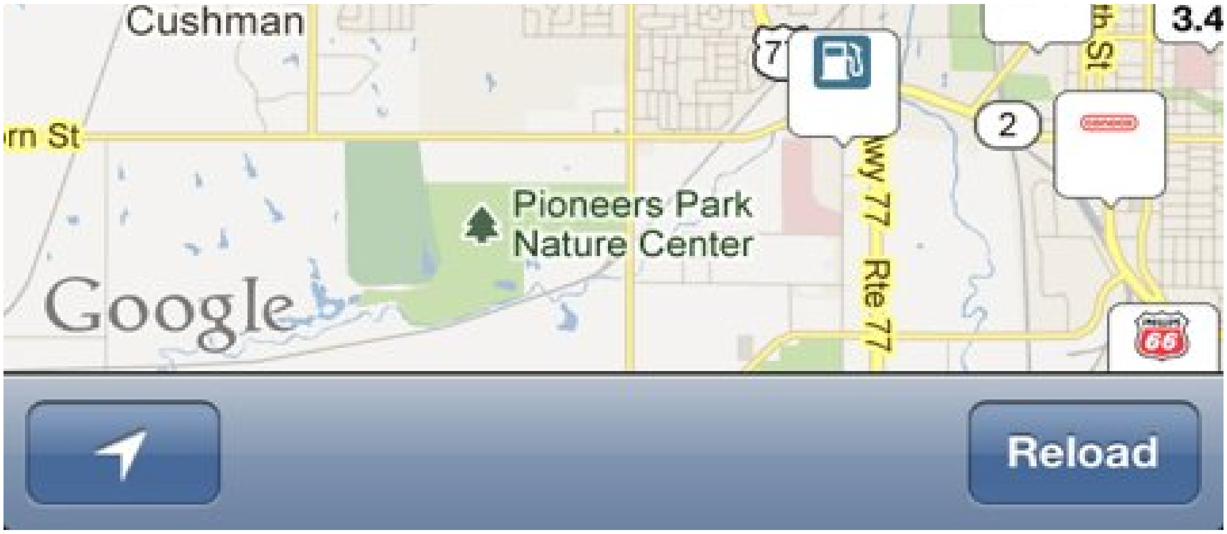
I hope you're having a great weekend.

Three Fuel-Saving Hacks for Long Roadtrips

By Mr. Money Mustache

Mon, 20 Aug 2012 12:00:53 +0000





I use this Ultragauge engine monitor to track fuel consumption at all times

This summer, Mr. Money Mustache broke his own rules and burned an absolute shitload of gasoline to crisscross the continent in a not-very-efficient vehicle. Sure, I can list a few excuses as to why I did it (it was a 7-week family vacation, I needed the big vehicle to carry all my carpentry tools and materials for working as well as the family, I made a profit on the trip overall, and driving prevented the purchase of four one-way plane tickets). But in the end, it still hurts to burn that much gas. 178 gallons over 4553 miles, to be exact.

But I did my best to fight back against the fuel consumption gods. My 14-year-old Honda minivan is a beast, with a 4200lb empty curb weight (plus several hundred pounds of cargo), a 3.5 liter V-6 engine, an automatic transmission that favors fast acceleration over fuel economy, and every power and comfort accessory ever invented as of its production date in late

1998. Driving conditions were tough, with winding forest access roads, Toronto traffic jams, and frequent air-conditioning. Plus, many hours of 80MPH travel on the return journey, strategically used to avoid the need for an extra hotel stay. Even with these handicaps, La Mujer Azul still averaged 25.5MPG over the course of the trip, about 30% better than the EPA estimate for that vehicle.

The basics of fuel-efficient driving were covered in the old classic Hypermiling article. But this summer I found a few new things that helped raise the bar just a bit higher. And here they are:

1: Honey-Badger-Style Air Conditioning

My van uses about 0.25 gallons of extra gas per hour when you flip on the air conditioning. That's 3 gallons, or $12.00 worth of fuel on a 12-hour driving day. If I tried to drive with the windows down at highway speeds, the fuel toll would be even higher. "Oh Well", I used to think, "A man's gotta stay comfortable."

But then I read a comment from another MMM reader.

Among the readers lurk many people whose Badassity greatly exceeds my own. Some of them were mocking the need for car air-conditioning, saying "BAH! Just carry a spray bottle of water when you drive. When you get too hot, spray down your face, your neck, and even the car dashboard, and you'll feel great for quite a while. When you dry off and get too hot again, just do it again!"

"Well shit", I said, "If these people can do it, so can I". So I embarked on my solo journey East with my largest and finest spray bottle filled with cold water, tucked into the closest cupholder. A daunting challenge lay ahead: crossing the desert of Eastern Colorado, and then the entire Midwestern Corn Belt at the peak of summer, in daylight hours, with no AC.

Windows were left fully closed, car ventilation fan running on medium-speed. (I've measured that the blower fan uses only about 2% of the power of the full A/C system: 30 DC watts compared to 2.5 engine horsepower, which roughly equates to 1600 watts).

The verdict: it works very well! I was shocked at how comfortable and cool I was with just the chilling effect of evaporating water on me. Each 10-second spraydown took 5-10 minutes to wear off before I required re-spraying. As a bonus, my body was forced to adapt to the increased humidity of lower altitudes as I drove. So by the time I got to my destination, I was tuned to survive the record heat waves in perfect comfort. I found it pretty interesting to note that I sprayed my way through only 1.5 gallons of water on the entire trip East, even while it saved me about 6 gallons of fuel. That's quite a profitable tradeoff.

I did this mainly as a challenge to see if I could handle it. On the way back I was carrying the family so we used the air conditioning. But this idea still has practical applications for many of us. You can use a sprayer on those fringe days when A/C is just barely needed. Or if you are carrying a family in a car with no A/C, give a spray bottle to every family member and watch the fun ensue.

2: Always Use a GPS, Even When you Don't Need One

On the surface, this might sound like Antimustachian advice. Am I really telling you to buy and use a $100 gadget instead of relying on your own brain and navigational skills to get you around? In this case, I sure am. And here's why.

Minimizing Miles Traveled: Driving is frustrating and expensive enough as it is. Every extra mile you drive burns off your 'stash and kills off your planet. So it's an activity that should be done with surgical precision. When I go somewhere, I let the GPS pick the most efficient route based on distance, speed limits, traffic lights, and even current traffic and construction conditions. When my older family members attempt the same thing, they use their intuition and go "the way they've always gone" to get various places. They always show up quite a bit later than me. They occasionally make wrong turns and need to backtrack. It's a huge waste. The GPS wins by a large margin, on average.

Predicting curves and danger: On the GPS, you see the layout of the road for the next mile or so, in 3-D perspective. You can see if a curve is coming up, or a cross-street, train track, bridge, or city center. This lets you plan your speed in advance, rather than having to hit the brakes when you come around the corner and realize the speed limit suddenly drops by 30MPH. This can save gas and prevent accidents.

Knowing when to coast: When following your route, the GPS warns you several miles in advance when a turn is coming up. Instead of squinting at the street signs for each cross street as you whiz down a country road at 60MPH, you confidently watch the road and listen for directions. When the time-to-turn gets down to 0.5 miles, I take my foot off the gas and start coasting down (as long as there is nobody behind me). From 60MPH in my van, this works out to an ideal hypermiling coast-down, allowing me to take a turn with almost no braking and then accelerate back to cruising speed. Together, these tips save loads of gas, time, and frustration, which will tend to pay off the $100 purchase price of a GPS within its first 1-2 road trips. My current GPS is the TomTom 540TM, in case that helps as a starting point for research.

3: GasBuddy on your Smart Phone

If you travel with internet access in your phone as I do these days, this is a way for the phone to help pay for itself. When the tank runs low, you’re usually in some town you’ve never seen before. You want to find gas at a reasonable price, in a spot that is convenient to your route. So you open the GasBuddy app on your phone, which instantly displays a map of all gas stations in your current vicinity, with the price printed on each. You can even zoom out to see prices in adjacent cities.

The savings can be significant, as I find there can be a 30-cent-per-gallon difference between stations or nearby towns. With my van’s massive 20 gallon tank, this is a $6.00 difference per fill-up, which can be optimized with just a few taps on the screen. Gasbuddy probably saved me $50 on this trip. The app is free (ad-supported).

All in all, the habit of fuel-efficient driving is a pretty interesting one. If you’re going to be trapped in a box for hours at a time, you might as well have a fun game like Hypermiling to keep you occupied. The simultaneous benefits of saving cash and expanding your comfort zones are just icing on the cake.

Selling the Family Jewels

By Mr. Money Mustache

Wed, 22 Aug 2012 12:00:14 +0000

So, some of us Mustachians are getting pretty old. That means our parents are even older, and our grandparents – if they're still around – are sagely pieces of living history.

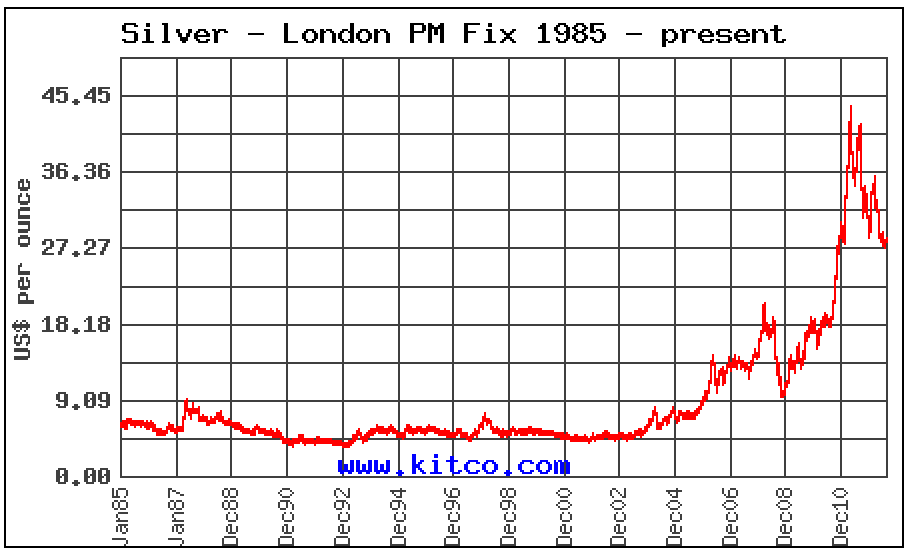
I love the many positive aspects of a family that shares its stories and values from one generation to the next. But this natural progression of life also brings with it some practical considerations: a whole load of material stuff that gets passed on from one generation to the next. Assuming you've already got enough stuff yourself, this can require some serious strategy to deal with properly.

As a case-in-point, let's take my dear Mum – the same Grandma Money Mustache who was featured in the Cost-Effective Renovations article. Many years ago, her own parents passed on, leaving various antique things in their estate. One of these was a complete set of sterling silver flatware. It was fancy (although impractical) stuff which we occasionally used for big holiday dinners when I was a kid. After each use, it would become oxidized and require meticulous polishing with special fluids.

Fast forwarding 20 years, this sterling silver has been sitting in a drawer in GMM's house unused for longer than some of us have been alive. She has no use for it, and it's just taking up space. On the other hand, with my family not being overly wealthy, she surely CAN think of a practical use for a little bit of extra grocery money. For years, she has considered selling it, but the task always seemed a bit mysterious and daunting.

This year, I finally decided to take on the challenge. During my recent visit, she handed me the heavy bag of silver and wished me good luck. My research began.

My first stop was the Internet. How much is silver worth these days, anyway? I keep an eye on financial markets in general, so I knew we were still in a middle of a big commodities price boom. Gold, Silver, Copper, and various other things have been running hot since the late 2000s. In other words, this is one of the best times to sell precious metals in many generations:



Silver prices (nominal): 1985 – present. source: kitco.com

In case you're curious, that flat line on the graph extends back all the way to the late 1700s, with the exception of a spike to about 20 bucks around 1980. As of this writing, the current silver price is about $29.35 per ounce. Excellent.

The next stop in my research was to find a place who actually wanted to buy this stuff. I started with eBay, figuring there are people out there who collect almost anything – maybe this type of silverware "Joan of Arc" was highly desirable.

Unfortunately, nothing similar seemed to be getting bids on Ebay. I researched a bit further by Googling through some online forums. The consensus among silver sellers seemed to be that the collector value of sets like these is lower than the melt value of the underlying silver.

So I turned to the local business directories. I found various gold and silver shops, foreign exchange places, and other traders. I called a few, and they helped me learn some useful things about this ‘stash of silver that I was looking to sell:

Silver flatware actually comes in two varieties:

- Silver Plated, which looks and feels just like silver, but is actually only covered with a thin coating of silver. Other, cheaper metals lie within. This stuff is not worth much in this context.
- Solid Sterling, which is always stamped “sterling” on the handle. This stuff is 92.5 percent silver metal.

There is one additional complication: even in a sterling silver set, the knives are usually made with stainless steel blades, and silver-plated handles. This was done for functional reasons, since silver is too soft to make a good knife.

When you add all this up, I was left with three piles, shown in this picture:

Sterling silver: Only the stuff in the center is saleable

You've got your knives on the left, sterling silver in the middle, and silver plated stuff on the right. After the sorting process, I was left with only 33.5 ounces of actual sterling, when weighed on a postal scale.

But there was still a hurdle to clear: who would actually buy the silver? All of the local dealers sounded a bit shifty to me. Many of them had bad marks on their Better Business Bureau record when I looked them up, or bad reviews. Most of them were quoting a payout of only about $15 per ounce for the silver – half the market price.

Some more online research led me to another buyer, this place called "Midwest Refineries" in Michigan. Reviews were reasonable, and their payout is a more reasonable 90% of the market price of silver. So I decided to check them out.

They have a circa-1993 website, which may actually be a good thing: what does a metals recycling company need a slick website for?

I sent a couple of emails. They were answered quickly and accurately by a guy with reasonable grammar and an email address that matched the company's domain name. Once again, a good feeling.

So today, I packaged up the sterling in a well-insured, USPS flat rate box. Shipping was $5.35, and insurance was $12.00. I sent it to Midwest Refineries, and let them know to look for it in Thursday's mail.

I'm expecting to receive a check for about $800. (33.5 ounces x 92.5% purity of Sterling silver x 29.35 silver market price x 90% payout rate).

Now, at this point, you may find yourself asking,

> **Eight Hundred Bucks for that tiny pile of forks and spoons in the middle!?**

And if so, this article has made its point. If you've got silver or gold in your family, and are not sentimentally attached to it, *you should seriously consider selling that shit!* Many people have much bigger piles of silver cutlery sitting around, and even silver plates, bowls, and other tableware.

That stuff is worth thousands of dollars now. And if you wouldn't currently buy it for thousands of dollars, that means you should sell it for thousands of dollars – a sound general rule for deciding whether or not to sell *any* of your stuff.

It's extremely valuable right now, helping with your cash situation. It serves to declutter your life, so you are toting and storing fewer material things for the rest of your life.

And it's even environmentally friendly to cash this stuff in. Today's sky-high precious metals prices have caused a mining boom (just ask any Australian). When you sell into the market, you are increasing supply, which tends to decrease the market price and decrease the profitability of mining operations. So less mining happens, if you decide not to hoard silver and gold.

In this case, I'll be passing all the proceeds on to my Mom once I get them, which makes the project even more exciting for me. I'll let you know how it turns out.

Update!

It turned out wonderfully. I published this article on a Wednesday, just after I sent off the package. I didn't get a confirmation email as I had requested from Midwest Refineries, so I was mildly annoyed, thinking they were slow to process the delivery. But when I opened my mailbox on Saturday afternoon, there was a check from the refinery, addressed to me!

Reviewing the papers they sent me, I got exactly what I was supposed to receive. In the equation above, I not realized that silver prices are quoted in "Troy ounces", which are 31.10 grams, which is 10% larger than the 28.35 grams size of the standard ounces I had measured in. This is all silly, since I think the world should use the metric system for everything. But anyway, in the end I got **$715.00**, which is still a wonderful haul for a handful of cutlery.

And because the service was so good, I can now fully recommend Midwest Refineries as a place for US residents to ship their silver and gold stuff for a nice 90% payout and quick turnaround. During the order, I didn't tell them I was Mr. Money Mustache and that all of you were watching, since that may have influenced their behavior. I have no relationship with the company and don't get referral fees, I just think they did a good job.

Fasting: a Fast Way to Greater Badassity?

By Mr. Money Mustache

Sat, 25 Aug 2012 01:40:11 +0000

Despite the fact that I am Mr. Money Mustache, I now realize I have led quite a wimpy and pampered life when it comes to the area of food.

As a young child, I was reportedly one of the pickiest eaters in history, refusing to try anything that wasn't prepared at home, in exactly the way I was used to it. By the time I was a teenager, I had become an enthusiastic omnivore, but arbitrarily decided that low-fat diets were most healthy. Following in the footsteps of the heroic bodybuilders in the pages of the *"Flex"* and *"Muscle and Fitness"* magazines of the early '90s, I ate six small meals a day, stopping for a sandwich between each of my classes in high school. Even now, I generally have a nicely stocked fridge and am deprived of nothing. In short, I'm a wimp.

Writing this blog has opened up my eyes to other ways of doing things. I've heard from people who eat only one large meal per day, as well as people who regularly and comfortably go without food for one or more days. And here I am, never having gone more than about 12 hours without food, for almost 38 years running now.

After switching to a much-lower-carbohydrate diet, I've noticed a considerably longer period in my natural eating cycle. Like a car with a giant gas tank, I can now go out on a long day's adventure without having to plan out a bunch of little snacks to keep me going. This has led me to want more: I've been planning to try out an experimental fast on myself for some time now. Far from being an unhealthy fad experiment, everything I've read suggests that going without food occasionally is actually extremely *good* for you. So I am just about ready to press the button.

The goal is mainly to understand more about self discipline, as well as learning new things about how the mind and the body work together. Fasting will be just another example of a healthy self-deprivation – the kind we must all do in all areas of life to remind ourselves just how cushy our normal life is.

But while I was waffling about all of this beginner fasting stuff, a friend of mine went and busted out a 3.5-day fast with no preparation at all, making me look even wimpier.

Enough of this crap, I'm starting a little 24-hour fast myself **RIGHT NOW**. So as you're reading this, I'm probably right in the middle of it.

What follows are my friend's notes from the experience.

The Fast

(by MMM reader HirsutePirsute)

I was fascinated by an article I read this spring in the March 2012 issue of Harper's Magazine by Steve Hendricks: "Starving Your Way to Vigor: The benefits of an empty stomach." It was well-written and informative and made a good case for occasional or targeted fasting as a way to better health. The author ended up doing a weeks-long fast, far short of some of the longest fasts, but still longer than mine, detailed below:

Monday, August 20

9PM – Tonight I embark on what I hope will be a three day fast. Not highly impressive compared to the great fasts, but a challenge for me nonetheless. I gorged myself on roasted veggies, burgers, ice cream, cookies, and chocolate milk in anticipation of the fast. I imagine I will weigh close to 175 tomorrow morning. Hopefully that will be closer to 167 when I next eat on Friday morning.

Tuesday, August 21

AM Weight: 173 lbs

10:23AM – I've had my first few pangs of hunger. I find myself absentmindedly thinking I can just grab a bite of something whenever I want.

5:25PM – I enjoyed a bit of an alcoholic buzz feeling for most of the afternoon. I still have that feeling, but I'm hungrier – I almost stuck a piece of cheese in my mouth without thinking while making tacos for the kids.

A recent study done at Stanford found that cancer tumors shrank when the subjects (mice with human tumors implanted) were given an antibody that masks a protein (CD47) that normally protects cancer cells from macrophages. A study at USC found that fasting causes cancer cells to reduce the expression of protective genes, making them more likely to die. Fasting also allows chemotherapy to target cancer cells with less adverse effects on normal cells. Maybe a combination of these treatments can radically reduce cancer's effects.

10:25PM – Anxiety is magnified when one has low blood sugar (LBS). My stress level was pretty high tonight after an unpleasant email exchange. I don't know how much of this stress was due to a lack of food and how much was real, but it was comforting to think that it was mostly the former. I was especially hungry at dinner time. Like a bad TV show, everything I watched seemed to show people eating food. I'm looking forward to a giant pepperoni pizza in a couple days. Guess I'm being pretty wimpy, really – I've made it one day.

Wednesday, August 22

AM Weight: 170 lbs

7:52AM – My dreams last night were more vivid than usual. I wonder if this means I slept lightly, but I feel rested. And I don't feel hungry, kind of a typical morning.

PM Weight: 167 lbs

4:08PM – I spent the morning working on a deck and much of the afternoon working in the shop. It was moderate activity, and for the most part I didn't think about food. As dinner time approaches (and activities dwindle) I'm thinking more about food, but I'm less hungry than yesterday at this time. I have a similar level of energy and buzzedness as I do when I normally experience LBS (which sometimes occurs if I have a light lunch and wait too long before dinner).

Thursday, August 23

AM Weight: 168 lbs

7:53AM – As I was going to bed last night I tried to envision foods I would enjoy. I wasn't extremely hungry, but I did experience some Pavlovian drooling. The pepperoni pizza was still foremost in my mind, and a bologna sandwich sounded good. Meat/carb combos were much more droolworthy than veggies, fruit, or even meat alone (although greasy, drippy things like bacon, wings, or ribs were appealing). I slept less well, waking up often, and had a slight headache. This morning I feel a little groggy, sleepy, low energy, maybe a bit sick, and I have a short fuse with the kids.

12:35PM – I messed up. My son and I were visiting a house we rent out and I asked him to pick a pear from the pear tree. I took a couple bites from the pear before realizing I was in the middle of a fast. I wasn't even hungry, it just comes naturally to grab a bite whenever and wherever you are. It was a fucking delicious pear. I'm going to forgive myself that transgression, though – it wasn't much more in the way of nutrients than the toothpaste I accidentally ingest. There was something biblical about my sin, though the apple was a pear and the snake was a worm in said pear (a tiny slice of protein?).

8:53PM – In the afternoon I drove to Boulder. I was cognizant of my potentially reduced driving ability, but I did fine. Back home I thought I would rest and read and watch TV for the evening, but I got a text from MMM himself asking if I wanted to go pick apples from the neighbor's tree. So there I was 15 feet up in an apple tree, picking apples and sawing off broken limbs with an extendable chainsaw. I really wanted to eat an apple, but I was able to avoid that sin. MMM had mentioned that he'd heard that foraging tends to dispel feelings of hunger so one can focus on the task at hand – that seemed to bear out. Back home I made dinner for the kids (which I've done all three nights of the fast) – everything was looking tasty, even the compost slated to go outside. If only the kids knew, maybe they'd actually eat the food I make them.

You know when you really have to go to the bathroom and there's a bathroom nearby, your body anticipates the proximity of said bathroom, and gets ready to release? Well, it's a little bit like that for me right now, knowing that I'll soon be mowing down some food, but working hard not to release too early.

I'm feeling good, not too hungry but still excited to eat tomorrow. Not surprisingly, no movement of the old bowels has occurred since yesterday morning. Piss, on the other hand (comma placement was important there), has been more forthcoming, and has retained its normal golden hue. I've been drinking a lot of water.

Friday, August 24

AM Weight: 164 lbs

7:49AM – Not a great sleep again, but I'm feeling better than I did yesterday morning. Some cottonmouth, a mild headache: indicators of dehydration, I guess. My stomach growls at me occasionally, but I'm not hungry, so I'll wait until I am to eat.

11:11AM – After 3 1/2 days, the fast is done. I just imbibed 24 ounces of delicious kale shake – made with kale from my garden, a couple pears from my pear tree, a couple apples from the neighbor's apple tree, some organic strawberries, a splash of organic apple juice, a dash of cinnamon, and some ice blended together. Although I still wasn't feeling particularly hungry, it was the best kale shake I've had (but I'm inclined to believe that's because it was the best kale shake I've made). Now it's suffusing throughout my body, turning me superhuman (and it will likely be suffusing its way out of my body in short order, hopefully not too rapidly). Oh, and that pizza is still on the docket.

Afterword – One thing that occurred to me while fasting is that there are millions in the world who aren't eating right now because they don't have enough food. My little three day fast was luxurious and cushy by comparison, knowing that I would soon be eating again. There is enough food on the planet to feed everyone, yet we have environmental and distribution problems (many of them willful yet easily avoidable). A growing population and changing climate will exacerbate those problems and stretch our food supply further. First-worlders (especially Americans) need to learn how to do with less, waste less, and cooperate more with the rest of the world to help curb the growing catastrophe.

Disclaimer: Please consult a doctor before you do any extended fasting – neither MMM or HirsutePirsute wants anybody dying because of stuff they read here!

Further Reading: Years later, a reader shared an interesting article suggesting that fasting may affect female fertility. On the other hand, other women swear by the practice and see benefits. The deciding factor might be the intensity of the fast. Some readers on the forum have experimented and shared their results here.

Mr. Frugal Toque Gets Laid Off

By Mr. Money Mustache

Mon, 27 Aug 2012 12:00:05 +0000

Foreword by MMM: The following is a tale from my good friend, Mr. Frugal Toque. We went to engineering school together many years ago, and started our careers at the same time. Although I moved to Colorado 13 years ago, we've kept in touch regularly since then.

He recently went through a rare experience for a software engineer: a fairly long period of unemployment. I got to follow along with him by email through the whole thing. His experience was so interesting, that I cajoled him into writing this story about it to share it with You.

Being Laid Off is Not the End of the World

About three months ago, I was declared "redundant" at the high tech company for which I had worked.

It was a very strange thing, when the poor sod who'd drawn the short straw came around the lab and called my name. Those in the lab knew what it was – we'd had a very brief period of warning. People react in a lot of different ways to such a realization. Variations include shock, hysterics, violence, calm acceptance, belligerence and all sorts of combinations.

My reaction was odd. I looked at the guy who'd been tasked with fetching me and said, "Layoff? Seriously?" I don't know what I was going for. Indignation? Indifference? Humour?

It’s worth noting, at this point, that engineers in my area get calls from recruiters on a fairly regular basis. It’s also worth noting that, like good Mustachians who had been watching my former company burn through its cash reserves, my wife and I had kept a good chunk of our investments numbered for just such an emergency. So I could afford to be calm, financially speaking. If we had “car payments” and “credit card balances”, I might have lost my trademark cool.

So there I was, having accepted the thing they called a “package”, gathering up my personal effects and heading home. My wife took it well. She’d been through this once, too, and understood the importance of keeping things positive. One should never ignore the power of a supportive spouse.

When I got to the computer, thinking to look up some of those recruiters, I received a call from yet another, enjoining me to take an interview that very week.

I questioned the wisdom of taking an interview so soon. Wasn’t I supposed to be in shock? Wasn’t my ego supposed to have been shattered and crushed by this cruel blow? Maybe part of staying out of depression is declaring yourself undepressable. I know I’m trivializing. Depression is a serious thing. Whatever it was, I went to the interview and handled the technical part in such a way that the interviewer was pleased. Then I asked for a salary slightly higher than what I’d been making.

That was quite a bit of confidence. I wondered then if I was just messing with myself, trying to convince myself more than anyone else that my pride had gone unwounded. The recruiter got back to me to tell me that the requested salary was the deal breaker.

But life went on. I spent a couple of hours each day tailoring resumes for two or three job openings. There’s only so much of that one can do in a day.

It was also summer. My wife and I started running. When the six year old finished school, he started either running or biking with us. We pitched a tent in the backyard and we all slept in it. Camping preparation, we called it. We went hiking. We had ice cream afterwards. We spent afternoons at the library. The kids loved it.

And still, the whole time, I was doing interviews, sending out resumes, talking to people on the phone. Hiking adventures would be delayed or bumped occasionally, which the children understood since daddy did need to find a new job eventually.

I felt like my chest could expand more; that a greater amount of cleaner air could fill my lungs. It was a feeling I had caught the very day I had been laid off. Surely unemployment should have been stressful, but it wasn't. My job, unbeknownst to me, had gradually become so heavy on my soul that being laid off was more relaxing. The very night my job had been taken away, I had slept better than I had in a long time.

And still, through it all, there was always the desire to do something. Fix something. Go out. Teach the children. I promised them that a play structure would be built in the backyard once I secured new employment. We all spent several days drawing on the white board to determine exactly what it was we all wanted. Accessories were procured via kijiji and Craigslist as they became available.

By this time, about a month and a half into my unemployment, I'd had two really good interviews, but still no job offers. It was taking a bit longer than Mr. Money Mustache had predicted when he first learned of my layoff.

One prospective employer, a jovial fellow who interviewed me in a skylit meeting room, surrounded by people who had no black circles under their eyes, quizzed me with a short list of very penetrating questions. Without the aid of an annoying technical interview, he gauged my skills quite effectively. The only drawback was that he wanted someone right away and I wanted to enjoy a little more summer with my kids.

A second interviewer, who did subject me to a technical test, did the oddest thing. He asked me to write code that I didn't know how to write and invited me to ask him questions, or surf the Internet if I preferred. He didn't want to quiz me. He wasn't attempting to mimic Final Jeopardy. His goal was to see how I figured things out. I thought that was rather bright, and told him so. While I was away visiting family, they sent me an invitation for a second interview. Decent people were met upon my return.

I continued to enjoy my time with my family. My wife said that she'd really enjoyed my time at home and that we should ride the early retirement bandwagon even harder once I got a new job.

At last, after almost two months of searching, waiting (and enjoying), a job offer came in. To say it was generous would be an understatement. It turned out my former company had been shorting us for some time. You see, every single person who had been laid off – absent a few who were so financially secure they weren't even looking yet – had landed a job for higher pay.

I looked at the offer, looked at my wife, and the first thought in my head was that here was a way to retire even faster than my most optimistic assumptions had allowed for. We did the math. This would indeed change things quite a bit. It never occurred to us that our largesse should be spent to lease a bigger car or get a bigger house. Financial stability and future summers of quality family time were foremost on our minds.

I'm not writing to brag. I'm not writing this to slap you in the face if you lost your job and have trouble finding a new one. I'm writing this for two real reasons.

First, I want to underline the importance of having a 'stash. What allowed me to remain relaxed throughout this process was the combination of money set aside in semi liquid investments and the lack of big monthly payments on borrowed items. The fact that I could have afforded to spend the better part of a year unemployed was what let me enjoy my time with my family. It was also what let me approach each employer with an analytic eye. I could see which interviewers had those circles under their eyes; the dark indications of either a sweatshop or a few too many attempts at making Horcruxes. I went to interviews relaxed and smiling, which gave the right impression to the people who did finally make the offer I wanted – the impression of a lighthearted, hard working individual with a lot to offer.

The second thing I learned was how pleasant retirement could be. There are always productive things to do, from home repair and gardening to play structure building and writing. At the same time, there are so many things to do that are just fun, I couldn't even do them all in over two months of unemployment. There are books to read, children to teach, evil fifth-level

Human Conjurers to defeat*, people to visit, places to hike and bike. The world will not let you run out of things to do if you're the type who likes to do things (and you are, or you wouldn't be reading this, would you?).

I'm in my first week at the new job, and I'm enjoying it very much, not least because I found it myself, for myself, without the help of any recruiter. I think I've found a place to do something useful and interesting while piling up my 'stash in what a wise man referred to as, "the anchor leg of my career".

The greatest benefit of the experience, however, is that it has at least doubled the Toque household's determination to achieve early retirement.

* – for which I recommend wearing the wooden necklace the old lady gave you just before she died. Just sayin'.

A Wealthy Future for Junior Money Mustache

By Mr. Money Mustache

Wed, 29 Aug 2012 12:00:57 +0000

You'll never hear me claim that being a parent is even remotely easy or convenient. But it sure does have its golden times, and this week has been one of them here in the Mustache household.

My son (known here affectionately as Little MM or Junior 'Stash) has finally discovered the joys of bike riding, and it is making me a proud Dad. He was a little late to start – when he was 2 through 4 years old, he generally resisted the frustrating prospect of trying to get around on a tricycle and later a "scoot bike". He is unfortunately just like his father was at that age: afraid to try something new, unless he is sure he can master it on the first try.

But at age five, late last fall, he had a breakthrough. We took the scoot bike down to the slightly sloped parking lot at the high school, and he just started coasting on it. And scooting, and coasting some more. Within an hour, he could balance indefinitely, given a long enough hill. Over the following months, we progressed through a few more scooting sessions, but then the habit was lost with the shorter days of winter and various trips.

Early this year I got him a basic bike with pedals and no training wheels, which led to another breakthrough: unassisted, real bike riding. It was sufficiently fun that he started wanting to ride more often, and suddenly he and I started heading out on father and son adventures around the town. Over to the park to use the play structure, or down to the creek to splash around and make dams. We were covering some real miles, he was growing quickly, and this first bike was a bit of a junker: a heavy-as-a-tank single speed Mongoose model that we found for only $14 at Play it Again Sports. Good for learning and crashing, but at 65% of his bodyweight with very short cranks, not much use on a steep hill.

So it was with great pride that I recently set out to find him his next bike. This would be his first "Real" bike – one with more than one gear ratio, a bigger frame and wheels, and enough room to grow that he could enjoy it for 3-4 years. As a family that treats bikes as the main form of transportation rather than just toys, we wanted something that will help him cover hundreds of miles per year. I also wanted him to be able to ride with me on country road adventures to the other towns around here, and to start checking out some of the excellent mountain bike trails in the foothills.

After a bit of research, it looked like the most likely candidate for the job was a bike called the "Specialized Hotrock 20". It's a cute little number with 20″ wheels, a light aluminum frame, and a 6-speed rear gearset. There's even a decent quality front suspension fork to absorb bumps and increase its curb-hopping and trail riding abilities.

Checking one out in the bike store when buying some parts recently, we found that this model came highly recommended by the shop owner. The $350 retail price seemed reasonable for something with that level of quality. But obviously you never buy anything new in a store without first doing thorough research on Craigslist. And true to form, Craigslist offered up a plethora of Hotrocks from which to choose.

I did the usual round of reading all the ads, contacting the sellers who lived closest to me, and conversing in detail with the ones who ended up getting back to me. The winning seller had a matching pair of the bikes up for sale, only 2 years old and barely used, with an asking price of $200 each.

Over email, I politely negotiated a selling price of $150 using the techniques in the article above, because most of the other Craigslist sellers were asking the lower amount (although they were further away from where I live). The offer was accepted, so I set out to pick up the bike.

The seller was exactly the type of person from which you want to buy things. A friendly, meticulous, lady in Boulder with a $1.3M home (according to Zillow). The matching bikes were sitting there in a garage full of other nice stuff, very shiny and barely used. “Yeah, the twins enjoyed these bikes. They just didn’t use them much since they mostly used their scooters last year, and this year they grew out of the bikes.”

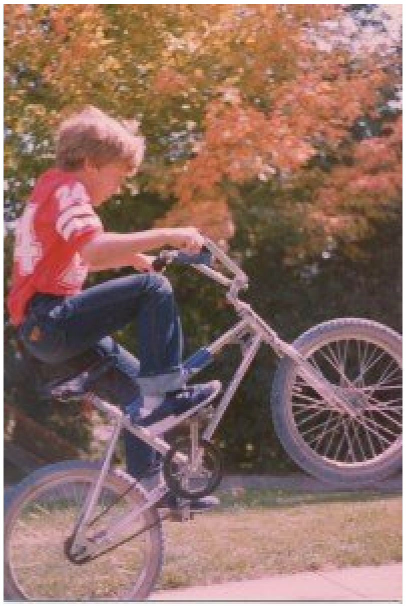
You might be pretty excited that I got this $350.00 bike for only $150. But it’s even better than that: in four years when he grows out of it, the resale value will still be at least $100, making the real cost of ownership about $12.50 per year. From an economics perspective, buying it used also helps to reduce the demand for new stuff. And it helps to close the irrational gap between new and used pricing, which will encourage more trading of used goods and less waste.

I brought the bike home and things have been a whirlwind of riding ever since. Little MM loves the speed and the ability to climb hills. I even installed a digital speedometer on the bike, because I knew that the little Mini-Me would love tracking his records and stats and reporting back to his parents (5.11 miles last night, in case you were wondering).

I almost felt a little out of character when his new bike made its debut among the other first graders. It is clearly one of the nicest bikes in the schoolyard, and I was suddenly aware that it might cause envy or upgrade pressure to the other kids and their parents. It’s the opposite of what I usually try to do when it comes to setting an example in the community.

On the other hand, a bike is a tool just as much as it is a toy, and getting in the habit sets the foundation for a lifetime of health and wealth. Riding instead of driving can make the difference between a crushing college education debt, and complete debt freedom upon graduation. And it can make the difference between “broke” and “millionaire” over the period of just part of an adult lifetime.

Heck, now that I think back, I believe my Dad got me a pretty good bike at just a couple years older than my son is now. I might even have a picture of it scanned in somewhere:



Oh yeah – Mr. Money Mustache, 1983 edition, loving the new bike.

-

We have a family tradition where I draw a different picture each school day and stick it on his sandwich container. Then he gets to discover it when he opens the lunch bag. For today's picture, I made this one:

So congratulations Little MM on your new skill! I can’t wait to ride our butts off together over the next 60 years or so.

Reader Case Study: Portland Man Thinks He's Doing Well

By Mr. Money Mustache

Fri, 31 Aug 2012 12:00:50 +0000

All right, here's a neat case study for you.

A guy from Portland emailed me way back in May. He sent in a nice proposal for a case study, but I didn't get around to writing it up until now.

Now, the time has finally come. And when I got back in touch with him, I found out he had been reading MMM and participating in the Forum section ever since. And during this time, he has both made some positive changes and scored a raise for himself.

So what follows is the original case study, some MMM recommendations, and then an exciting epilogue showing the current scene.

Dear Mr. Money Mustache,

I bet you get a lot of "hey will you do a reader case study" requests, but I have to be honest with you – most of the ones you select suck a little.*

I know you gear it towards upper middle class, so I'll forgive you for most of them, but at least pick someone hard, rather than the easy pickins of folks with $800/month in car payments.

So, if you want a challenge – do me, do me.

The quick and dirty – Single Income, married with 1 kid (19m0).

Income summary:
$62,500/year salary
Stock dividends from a partnership $2400/year
Income from teaching basic motorcycle riding course on weekends: $2000

Monthly take home from salary – $3,960

Spending – the high points:

Household spending – $726/ month, includes utilities, pets and $260/month in food.
Cars – $300/ month, includes fuel, maintenance and savings for replacement.
Mortgage – $917, we're on an ARM, so we're only paying 3.8% right now. We want to refi this into a rental and put 20% down on a bigger place for ourselves in a couple years.
School Load – $120 – interest rate is something like 3%, it costs us less than $10/month, so at this point I'm in no hurry to pay it off.
Allowance – $150 for me, $150 for my Wife, $50 for the baby and $80 for the dog. (The dog allowance will probably go away sometime soon, it's actually just accumulating in a savings account in case we need it for something.)
Health Care – $525 – my wife and daughter are healthy, and we have a $260/mo policy that covers them, the additional is to cover actual care costs. Typically that's me, even though my work covers my insurance I have a heart defect and tend to run up co-pays.
Charity – $40. Lip service, it's mostly even to NPR, but whatever

Total Spending: About $3050/month

Assets:

Home equity: About $30k on a $175k house
401(k): $42k, I only drop $550/month on that, including employer half matching.
Cash: $22k in the long term savings account that will be used for a DP on a house when it hits the $40-50k mark. (Projected in about 2 years.)
Other misc money accounts: $8-12k.

Okay, here is where you can make fun of us –

Cars – 2004 BMW 325i wagon. I love that car. We paid cash for it in January 2010. For all you bag on BMWs they are really good cars, we've got a good independent shop that I trust for service.
1995 Land Rover Discovery – hey, it's got a fucking 5 speed! Rare. But a shitty car really, we'll be selling that shortly, but it's nice to have as we drive over the Cascades to visit my parents about once a month and in the winter a 4wd with good tires is good piece of mind. (And it'll only sell for a couple thou, I'm not that motivated)
I've got a 2002 VFR murdercycle that I ride back and forth to work – 7.5 miles each way, it averages about 35 mpg commuting so I use about a half a gallon of gas a day.

That's about it.

The problem: I'm not terribly fond of my job (engineer). At this rate I can retire pretty safely in 20 years, but then I'll be 53 (and with a bad ticker I don't know what that will mean), the kid will be all growed up.
The real problem is that I didn't read Early Retirement Extreme until about the same time my daughter was born (and while I was having a particularly hate hate relationship with my job)

Why should you do us? We are right around the median household income. We are slightly better off than our peers (on average), and I think we do a pretty damn fine job of living the Mustachian life, but I don't consider 53 to be early retirement or financial independence.

So tell me, Master of All Things Mustachian – how can I (significantly) quicken my path to financial independence? Can I proudly grow a mustache, or must I hide my head in shame until I cut the needless spending on… whatever is excessive.

*Excepting the teacher one, that was real good and the minimum wage one.

Mr. Money Mustache Responds:

This is an interesting case because we're starting with a fairly Mustachian-sounding family, who wants to go further. By his own calculations, he is 20 years from retirement, and would like to pull that in significantly.

If I were to start running this show, my first step would be to clarify the numbers. I can see from the way this reader details his finances, that things are a little bit mishmashed, with some expenses grouped together, a variety of random streams of savings, and no clear picture of what the REAL monthly expenses are. And this is after I spent about 15 minutes hacking up the above list to the items at least slightly more comprehensible.

For example, when calculating your housing expenses, I suggest separating the principal repayment (a form of savings), and interest (a monthly cost which will eventually disappear once you pay off your mortgage), from the things that will be ongoing expenses in retirement (property taxes and utilities).

Similarly, your car expenses should include registration, maintenance, and fuel. But I don't recommend "savings for replacement" because that category is too vague. If you drive a small enough amount, you may never need to replace your car. And when you do replace it, you could be buying a vehicle priced anywhere from $500 to $20,000 depending on your style. Instead, you might replace "savings for replacement" with a "vehicle wear allowance" of about 15 cents per mile. Once you start thinking of car costs as directly proportional to how much you drive, you'll start having appropriate motivation to drive less.

So let's boil it down to what I see:

Assets: $108,000 (including home equity):
Annual Living expenses assuming a paid-off house: About $25,600

($2133/month).

To escape from your job, you need to do some combination of

- paying off your house
- accumulating stocks that can provide some income or managed payout, and
- acquiring other assets that might pay more in exchange for a bit of work or knowledge.

If we wanted to do it all with stock investments using the 4% rule, you'd want $640k invested plus the $175k of home equity for a total net worth of $815,000. With your current savings rate of around 40% of take-home pay, you're right that it will take around 20 years to get there, starting from where you're at. The actual balance of your student loan balance was not listed, but you'd want to add that to the amount as well.

On the other hand, if you could cut your annual expenses by 10k per year, or increase your net income by that much, or do a split of the two, you'd be at a 60% savings rate. Adding in your existing savings, that would slice your time to retirement down to about 11.6 years, according to the nifty Networthify calculator (which was in turn based on the Shockingly Simple Math post, which was in turn inspired by a chart in the Early Retirement Extreme book..)

And it gets better than that: if you plan to keep the motorcycle instructor income and the $2400/year income from the partnership shares, you'll only need to replace $21,000 of income after retirement.

If you own and manage one or more profitable rental houses after retirement (you'd want to rent your own out for at least $1500/month to make it really worthwhile when you move), this can pull things in even closer.

So that's the bright side. Now let's look at improvements that can be made immediately:

Your vehicle fleet is a bit off the hook for a family in your position. You've got three machines for two drivers, and none of them are even remotely fuel-efficient for the job they accomplish. I'd suggest selling all of them, and getting a single manual-tranny hatchback – maybe one from the Top 10 Cars For Smart People List. It should get at least 35MPG, making it acceptable for occasional single-driver travel, although in general you'll be using your bike a lot more from this point onwards. And sorry, you have to sell your motorbike. I had the same bike, and I sold mine, so you can do it too.

This move will not only cut your gas, insurance, and maintenance costs, but it will free up several thousand dollars towards your goals!

Once you've done that big step, there is still plenty more fat that can be trimmed. Allowances? Why not try the Spousal Frugality Check method to make them unnecessary. A dog? That's a pretty expensive optional companion to add to a family that is trying to get ahead financially. Keep this in mind if there's ever a temptation to add more pets!

However, I can definitely offer my stamp of approval to your housing and food costs. There is not much that can be trimmed from that, which is the main reason you have a fairly good savings rate in the first place.

Summary: Find an extra $10k per year, and you're good to go. Build up alternate income sources and you'll really be on fire. You could be free from office work within as little as 5 years!

Epilogue: When I got in touch with Mr. Portland this afternoon, he shared the following update with me:

I did get a raise to $70k after getting an additional license since I wrote you…

Looking at the list, some other things changed too, I guess:
Sold the Land Rover, Started Bicycle Commuting 2x per week, Refinanced the house, Paid off Small Student loan when MOHELA took it over… I didn't realize we'd done so much recently.

Wow! Congratulations again to this reader. For the most part, he has solved his own problems with the help of other readers of this blog.

Procrastination on my part has paid off. But that only works when you're already retired.

In your case, perhaps you can see some parallels to your own situation, and a shortcut through the maze to financial freedom?

Have a great weekend.

It’s Never too Late to Ditch your Gas Guzzler

By Mr. Money Mustache

Tue, 04 Sep 2012 12:00:40 +0000

Mr. Money Mustache has been getting quite a few emails these days asking questions like this one:

Dear Mr. Money Mustache,

I’ve only recently discovered your blog, and I have decided to change my ways for the better. But I’m still stuck with the relics of my un-Mustachian past, like my trusty (Full-sized 4×4 Pickup truck with V8 engine, Toyota 4Runner SUV, Land Rover LR2 Fake Executive Luxury Truck, etc). But it’s paid off, and I’m not sure if I should go through the expense and/or hassle of switching vehicles.

What should I do – suck it up and live with my past choices, or fix it?

It is always nice to hear people asking this question, because it means one of the biggest financial mistakes in the lives of most people – a ridiculous vehicle choice – is up for reconsideration. But far too often the error never gets fixed, because people don't do the math for themselves.

I hear things like,

"Well, it's paid off, so I should keep it forever now, right?"

That's an old argument left over from the days when people "financed" cars, and then eventually donated them back to the dealer for a tiny credit towards another financed car in a tragic move called the "trade in."

Of course YOU don't have a car loan, and you buy and sell your cars in the private market, miles away from the stealerships right?

If you DO have a loan, go ahead and work on that debt emergency. But the finance status has nothing to do with whether or not you're driving the right car. So let's not call it a "paid off" car, let's just call it a "car".

The next issue is the definition of reasonable fuel economy. When I hear people describing their beloved trucks and SUVs, I often hear comedic phrases like, "it's not that bad, actually. I get 17MPG in the city", or, "on the highway, I can get 22-23 MPG consistently".

Those are good figures for a dump truck or a school bus, but when you're talking about a vehicle that is regularly used to transport fewer than 10 people, they shouldn't even enter your realm of consideration. Reasonable fuel economy starts at 35MPG (US, highway), and much higher is possible.

For example, the Honda Insight 2-seater from the early 2000s regularly returns over 70MPG in combined use, yet you can buy a nice 2001 one on the used market for under $4000. If you commute alone or have no children, this may still be the ultimate car. Take that, Prius!

So let's see how much people really are wasting on fueling their AntiMustacheMobiles.

In one of the most recent emails, a guy told me he was driving about 40 miles per day in a pickup truck.

At 40 miles/day x 200 workdays per year, he's commuting 8,000 miles per year just for work. We can add in another 7,000 for errands and vacations, and end up with 15,000 miles, right around the average US annual driving level.

Assuming this truck burns at 18MPG, this person is wasting 833 gallons of fuel per year, or **$3100 every year** even at our among-the-cheapest-in-the-world price of $3.75/gallon.

Switching to a more reasonable car at 35MPG would **cut the bill by $1600/year**!

Switching to an actual commuter car like the Insight at 70MPG would shrink the gas consumption to 214 gallons, and **reduce the bill by $2300 per year**.

If you don't get excited by numbers like $1600 and $2300 per year, I need you to take a break from reading, print out a picture of me, and use it to punch yourself in the face while looking into the mirror so you can watch the grave disciplinary scene unfold.

And this is because every ten years, compounded at 7%, those savings add up to **$22,000.00 and $31,700 respectively**.

Let's put it another way: Switching from an SUV to a car, will **save you enough to buy a new luxury car every ten years**, or an excellent used car every four years.

But since that would be a foolish use of the savings, let's consider another option: For an average earner with an average savings rate, switching from an SUV to a car will **allow you to retire at least ten years earlier.** In fuel savings alone! If you add in the cheaper tires, oil changes, and other parts used by efficient cars, the savings are even bigger.

This is a point that cannot be stressed too strongly. There is almost no possible case for driving around in a sub-35MPG car. And yet the roads are full of them. Virtually all of the drivers are broke, and they can't afford even the fuel bills for their cars. And yet they continue to buy more gas guzzlers for themselves. It's the biggest source of mass insanity in the modern world, and yet people still buy these ridiculous cars for themselves every day.

If you have a side business or a very large family that requires major cargo capacity occasionally, it is usually **much** more cost effective to own an efficient car for most of your driving, and a second behemoth vehicle (an early-2000s minivan for example) for the rare hauling events.

Adding my own hauler minivan to the fleet increased my insurance costs by only $7 per month. Even after adding registration and depreciation costs, owning the extra machine is much cheaper than doing all the driving at the higher rate of fuel consumption.

For more occasional hauling, simply towing a trailer (open or enclosed), or turning your little car into a big one may even save you from the hassle of owning a hauler vehicle.

So hopefully this answers the question once and for all.

- Yes, you should sell your truck to get an efficient car, if you're driving anywhere close to the national average.
- Yes, it will save you a shitload of money.
- No, you won't be comparing your truck's used value to the sticker price of a new car, because you won't be buying a new car. Ever.
- Yes, your life will go on and be just as happy even as you adapt to the new way of getting around.

Just stop fooling yourself, and sell that effing gas guzzler before this article catches on and causes the resale value to drop to zero. You've been warned!

Happy shopping!

Does Peak Happiness Really Come at $75,000/year?

By Mr. Money Mustache

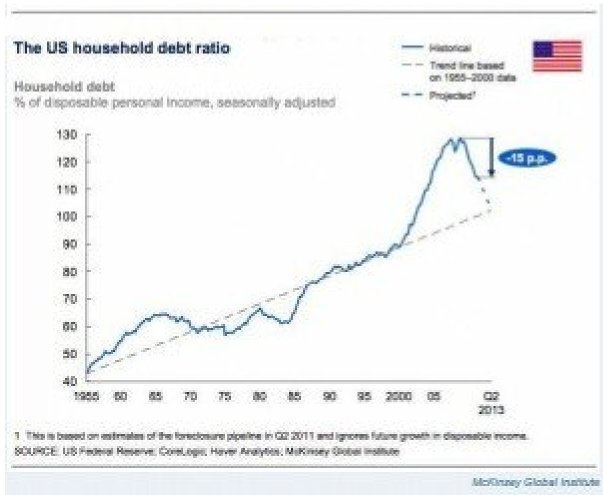
Thu, 06 Sep 2012 12:00:30 +0000

Mr. Money Mustache endures the deprived life of a frugal person with no motorboat during a recent 2-month summer vacation to Canada.

There's quite a bit of interesting stuff circulating in the mainstream media these days on the topic of personal finance.

You've got the Whiny articles, where high-income people with terrible spending habits talk about the crushing cost of living these days, and how "we're the first generation that will never be able to retire". Waah, Waah. We already made fun of those articles and the people they profile in this old MMM Classic Article.

Then there is the debt angle. Consumer debt has been rising as a percentage of income for decades, as increasing numbers of people are fooled into trading future freedom for current overspending. In the US, this debt escalation is temporarily on pause due to the after effects of the great financial crash, but in other countries (including Canada) the party has continued.



In fact, I recently participated in a CBC news interview along with two MMM readers, where the reporters contrasted the modern debt-based lifestyle, with the life of people on track to retire before they hit 40. The show is a national TV/Radio/Web combo and it in production as I type this, but it will probably appear at this link when it airs on September 6th*.

Student loan debt has joined the fray, racking up at record levels as universities raise tuition at rates faster than general inflation. Meanwhile, economically uneducated students and parents select out-of-state and private schools with higher tuitions and live far-from-frugal lives during those four years, resulting in fairly large loan balances upon graduation.

School debt has become a popular feature in US media, to the point where my friend No More Harvard Debt has become a national TV personality** – just by making the effort to pay off his Harvard Business School debt at a reasonably quick pace. As opposed to stretching it out over decades like many people do while simultaneously buying cars, houses and iPads for themselves. Joe from NMHD did the right thing by realizing that, duh, you pay off your debts FIRST before buying additional stuff. But the practice is so rare these days, that you get to be on TV if you do it.

Finally, there is the occasional counterpoint in the media, where psychologists and other researchers pipe up and suggest that maybe we're all chasing the wrong dream, and that *just perhaps* our goal should not to be to earn the maximum possible income at all costs. Stories like these are always controversial, because when you ask US residents whether they would rather have more free time or more money, they always say "More Money".

One of the concepts that pops up in these discussions is that "peak happiness occurs at $75,000 per year". The basic idea is that studies and surveys show that households don't get noticeably happier when they exceed this threshold of earnings. And thus, we should all relax because $75,000 is a pretty attainable goal, much less than we thought we even needed to survive!

The researchers are clearly onto something here: the hidden-in-plain-view secret that once your needs are met, buying extra stuff does not make you happier. But they're also missing a much bigger point: where did that $75,000 number come from? What is it about that level that makes people happy?

I believe it's a combination of two things:

- $75,000 per year puts you in the top third of household incomes nationwide – so you're *better off than most people around you*.
- The survey participants were completely untrained in the Art of Mustachianism, so on average they lead highly inefficent lives.

Once you understand these two factors, you get a little "Aha!" moment. Because if some novice Antimustachian off the street can achieve peak happiness at $75,000, an even remotely Badass person should be able to do it easily with a fraction of that amount.

Maintaining exactly the same level of material luxury, but avoiding debt and making purchases more consciously (buying quality used items instead of new ones, not commuting to work in a pickup truck, doing occasional math before buying things, etc.) can generally cut a person's annual expenditures by at least 50%. So we're down to $37,500.

Moving to the next level of avoiding unnecessary stuff in the first place (owning one car and a bike instead of two cars, living close to where you work, and tinkering just a bit with minimalism), can probably cut 10-20 grand off of that already-reduced figure.

So in other words, the $75,000 Peak Happiness number is a measure of social norms, rather than the actual usefulness of that much money. If median income were lower, and especially consumer insatiability, the amount you need for peak happiness would be lower too.

Therefore the purpose of this blog is to allow you to fine-tune your own Peak Happiness number to whatever you need it to be, to allow you to heap on the added boost of complete financial independence.

What is your own number? What's the ideal household spending budget that would allow you to be as happy as possible? It's worth thinking about on a regular basis.

—

* Hmm… now that I see the little web article, CBC seems to be focusing on this "living on a tiny amount" issue and "forgoing almost all material luxury". Which is not what Mustachians generally do. I also like how they have a weird little washed out and vertically stretched frame capture from my skype interview, while the other Mustachian pictured is all super-handsome in front of a foresty background. Oh well – all publicity is good publicity as they say..(?)

** Joe/NMHD was even a competitor in a reality TV show recently, although I am not sure if that odd development is related to the blog.

To Reach the Top 5%, You Must Simply Kick the Ass of the Other 95%

By Mr. Money Mustache

Mon, 10 Sep 2012 22:40:33 +0000

To get the Free Parking, you must be willing to walk along this street.

Oh boy, look at that headline.

Sounds like another one of Mr. Money Mustache's trademark brash claims based on chronic overconfidence, doesn't it? I can already hear you saying *"Oh, thanks for the insightful advice, Mr. Money Mustache. I'll get right on that assignment of kicking the asses of 95% of people"*.

But while I do mean that headline almost literally, the challenge is not as daunting as it seems. As long as you set the right goals in the first place, choose your battles carefully, and understand a bit of the math behind what you're trying to accomplish. As usual, the concepts are best illustrated with a little Story.

Earlier this summer, a dear family member found himself in the hospital for a few days (he's fine now, thanks). My older sisters and I met up and traveled there together, surprising him with a visit in the recovery room. It was a great way to support each other and spend some much needed time together as well. But the family meeting is just the backdrop for this particular story.

One of the things about Ontario hospitals is that they are often set up as the Crushing Singularity at the center of a Parking Black Hole. If you are foolish enough to drive there instead of biking, you arrive to find a parking garage priced at $12.50 *per hour*, with a daily maximum of $25.00. In other words, to squeeze the visiting family of any inpatients to the maximum possible amount during the period of a typical visit. If you smoke your tires out of there in fear and disgust, you'll find street after street of "No Parking At Any Time" signs strategically arranged, designed to exhaust your willpower and eventually suck you back into the black hole.

My sisters and I *did* drive to this hospital, since we were coming from another city. And we knew about the parking situation in advance, deciding to pay it on philosophical grounds since the revenue goes to the hospital, which is publicly funded. Since our family was actually using this hospital, we felt it was not unfair to make a contribution.

But this good samaritanship had faded by the next day when we decided to visit the hospital again. Two $25.00 parking bills would be excessive, so Mr. Money Mustache was called into action.

So before departing for the hospital on that second day, I pulled up a Google Map of the surrounding area. I saw the grid of streets that were probably the no-parking zone. It was a ritzy lakeside neighborhood with large commercial strips nearby. But I also saw bigger trees and quieter locales just a few blocks inland. Then I spotted my target: a neighborhood soccer field with a small and old-looking parking lot. It was well under a mile from the hospital. I programmed this parking lot into my GPS navigator in advance and brought it with me, since my sisters have not yet learned to always travel with a GPS.

As we neared the hospital, the GPS effortlessly guided us through the residential neighborhood to the parking lot. It was free, and empty. We parked the car and enjoyed a twelve-minute stroll through the shady streets of a rich neighborhood, lined with huge oak trees and stone mansions. Mulberry trees were hanging over the sidewalks, so we stopped to harvest a few handfuls of ripe berries. It was a beautiful contrast to the cramped concrete parking garage, even before considering the victory of avoiding a $25.00 charge.

At that moment, I was struck with the inspiration for this article. We, the Mustachian Siblings, were enjoying a privilege and benefit that less than 5% of visitors to that hospital would ever experience. And it was available simply because we were willing to walk about 0.7 miles (1.1km) to get to our destination.

During the online research of the neighborhood, I had estimated in advance that free parking would probably become available as soon as you got far enough that most people would consider it too far to walk. At this radius, the cranky high-income residents would not be seeing their pristine curbsides polluted by non-German cars, and thus they would not have lobbied city council to make the streets No Parking zones. Using a 95% rule of thumb, I figured that this radius would fall at just over 1km, and I was right in this case. Now let's just repeat that to realize how crazy it is:

> **The willingness and ability to walk 0.7 miles to save $25 on parking put the Money Mustache Siblings in the top 5% of the population.**

That is a *very* significant realization, because it means that we kicked the asses of 95% of our competitors with virtually no effort.

Is it always so easy to kick everyone's ass? Not always, but much more often than you think. It all depends where you choose to do battle.

Let's take "putting the nose to the grindstone and working more than anyone else in the office" as one category. It's an honorable pursuit, and I've even dabbled in it myself back in my engineering days. People still do it all the time in their quest to get ahead. But the average US professional workweek is already around 40 hours. To be in the top 5%, you'd have to put in about 65 hours*, which works out to.. hmm.. **pretty much your entire waking life**, after accounting for sleep and other bodily functions. Since happiness decreases beyond a certain threshold of hours worked, there's a high cost to so much dedication.

It is of course possible to earn more income more efficiently than simply working more hours at your current job. But adding more income still takes *some* work, and that effort should still be weighed against other Top 5% options.

What about owning a 'Top 5%" car? That's a goal many people fantasize about in their quest for more money. With the average new car(truck) purchase in the US hovering around $30,000 today, you would need to spend well over $60,000 to have a car so nice.

Unless you've got a job you absolutely love, and no family or friends you like spending time with, neither of these contests are as profitable to enter as the parking and walking example above. But let's not despair: maybe there are other battles where more asses are readily kicked.

Health and Fitness: to reach the top 5% of fit people in the US populace, you don't have to sacrifice nearly as much. I'd love to get more charts on the matter to add this article, but for now let's assume you need roughly to accomplish this:

a bodyfat percentage below 17% for men (28% for women)
the ability to jog 2 miles
the ability to do 10 consecutive pull-ups and 25 push-ups

We haven't even qualified for a beginner's crossfit competition yet, but I betcha** a person with those stats is already within the top 5%, even if you're counting only people under 50. And yet, from personal experience I know almost anyone can reach this "top 5%" status with less than a year of putting in less than 2 hours a week of effort into it.

Compare that to an extra 25 hours a week for decades to be a "top 5%" office worker, and I think you can start to see where it's better to invest your time. Especially if you compare the benefits of top working hours to those of top fitness.

Moving on throughout your life, you can do additional comparisons of Effort vs. Asskicking Potential in many different areas:

- **Optimizing your spending:** how many hours would it take to figure out how to spend less than 95% of people of your income level, while maintaining equal or greater happiness? Reading most of this blog might already get you there, and with 262 articles at 1000 words each and an average 200WPM reading speed, you're looking at less than 24 hours of work. (But do space it out over at least a couple of weeks, because my shit's not so good that it's worth staying up all night for!). The hours you spend building your Frugality Muscle will probably deliver the highest hourly wage you'll ever earn, because you build it once and it pays you back for life. Mine has already saved me at least $1 million, with many decades of payback still to go.
- **Caring for your Children:** I've got one myself, and I've heard that they are only young for a few years. How well are your peers raising their kids? Can you think of any areas where you could do a better job than most of them? How about if you measure it in "hours spent together outside" or "how little time we spent sitting in cars"? It's not a contest, of course, but it can still be rewarding to put a few hours a week into improving in the areas you think are most important.
- **Trashing the Earth Less:** How efficient are your friends are family? How much work would it take to do less Earth-destroying than 95% of them? Is a healthy living environment worth any of your time?
- **Wasting Less Time:** The average person wastes about 4 hours a day on TV. How little TV would you have to watch to be in the bottom 5%? How difficult would that be to achieve?
- **Learning more:** Most people only read actual books for a few minutes per day. If you read for 45 minutes a day, how high would you rank?
- **Becoming Happier:** what is the underlying purpose of everything you do in life? Is it to get stuff done, or is it to be happier? Now, how much time do most people devote to the study of *happiness itself?* Would you be able to out-learn 95% of those people?

In the end, we're all going to build our own Badassity Portfolio in a slightly different way. We may prioritize income, spending, generosity, or entirely different areas. But in all cases, the return on investment, and the competition in the playing field, should be assessed first. And in most cases in the modern world, people are currently fighting the wrong battles.

Electric Cars: Are they For Real?

By Mr. Money Mustache

Thu, 13 Sep 2012 12:00:19 +0000

The other day, the lady and I were biking through the parking lot of the fancy Natural Grocers food store, when I suddenly screeched to a halt, without even realizing why I had done it.

It turns out the reason was that one of these things had caught the corner of my eye:

"What's going on here?", I thought. New cars don't normally show up on the US market without me knowing about them first. Especially futuristic little space-bubble cars, which are my favorite variety.

Poking around the car in the parking lot, I could see that it had a roomy passenger cabin, gigantic glass area giving a panoramic view, and… no evidence of a gas-burning engine of any type. The hood was far too compact to house a conventional engine, and looking underneath I saw no exhaust system, none of the usual fiddly drivetrain bits, and instead just smooth underbody panels and a beefy **electric motor.**

What I had stumbled across is the Mitsubishi Miev (also known simply as the “i”), just the latest of several intriguing electric-only cars to hit this country’s market in the last few years.

For those not familiar with this new bit of technology, it is very real: electric cars are out there, and they kick some serious ass, offering comfort, performance, 100-300 miles of driving range depending on the car, and a silky-quiet driving experience with no road-level emissions. All these attributes are available not in the hazy future, but right now. Among the most prominent are these ones:

- Tesla Roadster (released 2008) $109,000
- Tesla Model S (just came out last month): $57,000
- Nissan Leaf (2010): $32,000
- Ford Focus Electric (Fall 2012 in 16 states): $35,000
- Mitsubishi Miev: $27,000
- Chevrolet Volt: $39,000 (short-range electric plus full gasoline power)

They are all expensive, but you can start by **subtracting $7500 from the prices above** due to a US federal tax credit on vehicles of this type.

That still leaves more dollars than the average Mustachian should be spending on transportation, but right about the same amount that most Americans spend on cars of similar quality in each of those performance ranges.

So what I had discovered in my local parking lot is the lowest-priced electric vehicle currently on the US mass market. It’s neat new technology and it sounds great, but it does lead a skeptical person to ask quite a few questions. Having done some work on electric cars myself, I can even try to answer them right here:

Does an Electric car really cost less to fuel for a given distance?

Yes. Way less. To understand the cost, let’s understand the baseline of fueling a gasoline car. If you have a reasonable car that gets 35MPG and you can get gas for $3.50 per gallon, your fuel cost is 10 cents per mile. If you're a new reader and you still drive around in a truck, your fuel costs might be $0.20 or more.

Now check out this handy table I've made for you. You can see that the pure electric cars burn juice at only 2.4 to 3.3 cents per mile. From a cost perspective, it is like driving a car that gets between **116 and 145MPG**, or like **getting your gas for 89 cents a gallon.** The exact cost depends on your local electricity price, but I used 10 cents/kWh, roughly the rate I pay for 100% wind-generated power where I live (coal power is only about 8 cents here, but it varies around the nation).

Vehicle	Pessimistic EPA Range (miles)	Battery Capacity (kWh)	Electricity Cost per Mile (@$0.10/kWh)	Weight (lbs)
Tesla Roadster	**221**	**53**	**2.4c**	**2723**
Nissan Leaf	**73**	**24**	**3.3c**	**3375**
Ford Focus Electric	**76**	**23**	**3.0c**	**3691**
Mitsubishi Miev	**62**	**16**	**2.6c**	**2579**
Chevrolet Volt	**35**	**16**	**4.6c**	**3781**

But what about the battery life?

That's a good question. These cars use lithium batteries, and they are expensive today (about $400 per kilowatt-hour of capacity, meaning the MiEv has a $6400 battery on-board). General predictions seem to be a service life of 8 years or 100,000 miles for these batteries, which adds 6.4 cents per mile to the cost of travel, bringing us back up to 10 cents, just like a 35MPG car. And the bigger your battery pack (Tesla), the higher your cost per mile, as you are lugging around unused capacity which is fading away whether you use it or not. Uh-oh!

But wait: remember that an electric car does not need oil changes, transmission fluid, belts and hoses, fancy valve services or most of the other greasy stuff that comes with gasoline cars. In addition, big electric motors themselves have generally only one moving part, which in industrial uses of the past 100 years have shown that they are good for the equivalent of over 1 million miles with no service whatsoever. So you'll get a lot of that 6.4 cents back in the form of avoiding expensive service visits.

On top of that, lithium cells have been developing in a Moore's Law-like fashion, meaning technology and reliability has been increasing rapidly even as price drops. A friend of mine runs an online electric vehicle parts store, and I've been amazed at the almost monthly developments in the lithium ion battery market.

Imagine that you buy a high-end $1000 Core i7 ultrabook computer with a 256GB solid state drive today and use it for 8 years, until it dies. Then you want to replace it with another Core i7/256GB laptop in the future. When you go shopping, you find that even the slowest new computer is better than your high-end one was, and it costs $199. That's Moore's Law in action.

But aren't I just replacing road pollution with coal powerplant pollution?

Many people say this, and the answer is that it depends. Even if you can only buy 100% coal-fired electricity in your area, there is a slight improvement in pollution by switching to an electric car. The difference comes due to the fact that power plants are about 40% efficient, while gas engines are less than 20% efficient (the rest goes out as heat). When you factor all the other stuff like oil extraction and refining costs, electric transmission losses, etc., all you have to know is that the electric car does fine in this area.

The real benefit, however, comes in areas like mine where non-coal power is available. Here in Colorado, wind power is cheap and plentiful, and when you buy more of it, they just put up more towers in the otherwise-barren Eastern desert plains of the state. The impact on jobs is spectacular, as I keep seeing shiny new wind company headquarters popping up, and meeting highly-paid engineers and technicians who have come to the state to work in the growing industry. All caused by me just checking a box on my power bill that said “100% wind”.

We also have ideal conditions for solar generation, to the point that I can buy my own panels (even without subsidies) and build a system to charge an electric car off-the-grid, and the amortized cost of the electricity will be just as cheap as my grid power. (More details of solar harvesting are coming up in future MMM articles, as I continue to tinker with my own house with the goal of getting roughly energy independent over the next few years).

In California, solar power is extremely popular, and that state’s much higher electricity costs combined with federal and state incentives make it a no-brainer to convert a home rooftop to generate power and feed it into the grid.

So if you’re getting an electric car because you don’t like the idea of burning gas, you might as well go the whole route and use non-fossil-fuel electricity to charge it.

What about Driving Range? Will I run out of power in the middle of nowhere?

Oh, Waaah Waaah. Poor baby is accustomed to driving 300 miles on a tank of gas. And if his car ever stopped driving, he’d have to just sit in it and cry until he was rescued!

First of all, the range of these cars in the table above is estimated by the EPA, which assumes a lead foot and no driving skill at all. As a Mustachian, you drive your car efficiently, so you’ll see a 30% higher range (Japan’s more reasonable test cycle for these cars confirms that).

The GM (Chevrolet) Volt addresses this irrational fear by adding a gasoline engine and a fuel tank, which allows the car to drive in either electric or gas mode. It’s a beautiful car, but you pay for the convenience in the form of pulling two entire powerplants around, which leads to higher sticker price as well as weight (the Volt weighs as much as a small minivan), which leads to higher electricity consumption.

GM is in a tough place with the Volt, since they are trying to make a practical vehicle, but sell it to people who are still buying cars based on irrational emotions like "Is it fast? Will I look cool in this thing?", and "What if I want to drive it to the Grand Canyon?". Right now there's a video on the site showing the unfortunate state of their marketing necessity: http://www.chevrolet.com/volt-electric-car.html

From a strictly financial perspective, I'd suggest getting a Mitsubishi Miev, and either renting, car-sharing, borrowing, or owning a fuel-efficient second car for your longer trips.

In fact, from a strictly financial perspective, an electric car is just like any other new car: it's far from the most cost-effective way to get around. In a few years, depending on how the used prices shake out, they may or may not take on this status.

But for those of us who have far more money than we need anyway, and are interested in enjoying a high-tech luxury toy with minimal environmental guilt, this is an ideal candidate. I believe that paying the premium to be an early adopter, thereby advancing this industry so it can eventually displace the internal combustion engine, can actually be a fairly Mustachian choice to make.

Reader Case Study: The Long Road to Mustachianism

By Mr. Money Mustache

Sat, 15 Sep 2012 12:00:43 +0000

The battle of Mustachianism vs. Consumerism rages on, and we have made some serious headway lately, with almost a doubling of the blog's readership in the past month and some funny appearances in major media.

But with new exposure comes new skepticism, and the need to explain the whole package from scratch to whole legions of people who have never heard of it before.

Can we crack through decades of established habit to allow people to lead richer, happier lives? Many newcomers to the blog don't even realize how incredibly expensive (and inefficient) their lives are. To illustrate what we're up against, check out today's Reader Case Study:

Dear Mr. Money Mustache,

I discovered your blog a couple of weeks ago and have been reading it pretty much non-stop. I love your down-to-earth, practical and well-researched advice and was hoping you might be able to do a reader case study on my situation.

My husband and I are 28 years old (married for 5 years) and feel like we've made a lot of good financial decisions. However, like many of your other readers, I'm sure, there is one out there that is still haunting us and preventing us from realizing our dreams.

When we were in high school, we were both given the opportunity to attend state schools free of charge through a state-funded scholarship program. However, being in the "I'm a teenager so I know everything" stage, we both chose to attend expensive private colleges where we thought we'd get better educations. Even with private scholarships and after having paid more than the minimums every month, we still owe a combined $150,000 on our student loans. We consolidated our private loans as much as Sallie Mae and the Federal Government would allow and are currently paying a 3.75% interest rate (variable of course… I think it's prime+1%).

After starting to read your blog, we decided to try to pay off our student loans in 4 years. Doing the math, if he pays $2,000/mo. on his and I pay $1,000/mo. on mine, we can do it. Is this the right decision? Or should we be trying to invest some of that money? We currently have no money in stocks, bonds, or REITs, but have been considering starting small (until we get the hang of investing) and putting around $3K into the Vanguard funds you suggested in some of your posts.

Here's what our financial picture looks like:

– Combined salaries: $157,000 before taxes ($86,000 me, $70,000 husband) (I take home around $2,200 every 2 weeks and my husband takes home around $1,800 every 2 weeks because health insurance comes out of his check)

– Savings: $31,000 ($25,000 of it is in a high-yield savings account earning .8% interest, while the other $6,000 is in a normal savings account earning a mere .2% interest). This is both our emergency savings and our savings for the downpayment on our next home (We are hoping to get to 20% so we don't have to pay PMI next time around. Also, current market value on our house is approx. $10K-$15K less than what we owe).

– 2 cars (paid off) (I work 32 miles from home and husband works 40 miles from home. In our area, the jobs close to home pay less than half what we make traveling into the city.)

– Car insurance: ~ $140/month combined

– Mortgage and real estate taxes: $1675/month (unpaid principal balance of $206,029) (interest rate 5% + PMI). (As a side note, we tried to refinance but FHA regulations have changed since we originally got our mortgage and we were told there would be no significant advantage because our PMI would go up from $100/mo to over $300/mo, thereby cancelling out any savings) (We're also hoping to move from our condo into a single-family home in the next 5 years)

– Internet + basic cable (cheaper to keep 5 channels of tv than to get rid of it due to cable company's bundling) (husband works 2 days/ week from home, so high speed Internet is needed).

– Electric bill: ~ $120/month

– Gas bill: Between $6-$100 a month depending on how cold the New England winter is.

– Combined cell phone bill: $150/mo.

– Gas for the cars: ~$600/mo.

– Groceries: ~$500/mo.

Also, to throw another wrench in, I am going to community college part time to get trained in a completely different career. Anticipated remaining cost over the next 2 years is $16K.

Hopefully I've captured everything. I really appreciate your opinion and hope your readers can learn something from our situation.

Thank you,

All right, so we've got three main points here:

- A fairly large student loan debt
- The desire to save for a home
- The desire to save for retirement

Balancing all this out, we have a powerful asset

- An unusually large double-worker-no-kids income of $157,000 per year

How do you decide between these priorities? Do we pay down the debt as a matter of principle? Do we save for retirement because the expected return is probably greater than 3.7%? Do we save for a downpayment to get into a bigger house?

All of these are good questions, but there's one thing you need to do before any of that. You need to

SCREAM AND RUN AROUND LIKE YOUR HAIR IS ON FIRE!!! …… BECAUSE YOU HAVE THE MOST INSANE, RIDICULOUS, SUICIDAL, and STUPENDOUSLY EXPENSIVE CAR-COMMUTING HABIT OF ANY CASE STUDY I'VE EVER FEATURED HERE!!!

I mean, **HOLY. SHIT.** The two of you are driving a combined **ONE HUNDRED AND FOURTY FOUR MILES PER DAY**, and yet ending up at the same place you started each night. WHY?? A commuting habit like this will cost you **over $215,000 every ten years** if you simply shift the money you currently waste on driving, towards paying off your student loans instead. In fact, your choice to live so far away from your work is a *much bigger boat anchor* keeping you from getting ahead than any amount of student loan debt could ever be.

So I'm going to start by having you move close to work. Like, right now. I mean your husband should be shopping for apartments on Craigslist even as you finish reading the rest of this article. You can shout the rest of it across the room to him as you read and he searches. It's that much of an emergency.

You can rent out your current condo, and find a new rental in the city. Eventually the condo can be sold. Your new place might be smaller, but that's fully appropriate right now – you are in debt, so it's emergency payoff time, not luxury time.

Your new apartment can be at the midpoint between the two jobs, thus you can both bike, walk, or take the subway to work. In the worst case, one person can walk, while the other drives a short distance. This change alone will make the difference between "broke" and "millionaire" over just a portion of a typical working career. And yet it will change your whole life for the better. You're about to get all your free time back! You get to experience the feeling of ending your workday, biking home, and still having some time in the evening to actually accomplish something. From this point forward, you will not give a shit about what the rush hour traffic on the interstate looks like. And you never will again, for the rest of your life! Congratulations!

Compounding the savings, you'll be able to sell both of your cars, which are probably fairly new and expensive, and have between zero and one not-quite-as-new, efficient cars which don't require collision insurance coverage.

Whew, that was intense, but I feel a lot better, don't you? Without the outrageous drain of a crazy commute, you'll finally have the chance to start keeping some of your own money.

Since your income is similar to that of Mr. and Mrs. Money Mustache during our own Prime 'Stashing Years, you'll probably find that you have almost $100,000 per year available to save after expenses. To make the most of your high taxable income, contribute the maximum possible amount to tax-advantaged savings accounts like 401Ks and IRAs, using low-fee index funds as the vehicle.

Next, take your $25,000 emergency fund and throw it into that student loan. Your new lifestyle will be much lower cost, and you've got two incomes (plus the unemployment insurance system) backing you up, so there is no need to keep such a high buffer. That will save you about $925 per year of interest, further accelerating the payoff.

Meanwhile, you'll have time to brush up on additional skills, such as

- getting your $500 grocery monthly spending down to perhaps $250,
- the electric bill should be under $40,
- prepaid cell phones combined with Google Voice (and the voice/text chat plugin for Gmail) for unlimited free calls at home should run you about $50/month combined

plus, miscellaneous training sessions for your Frugality Muscles, including

- cooking your own food
- cutting at least some of your own hair
- doing plenty of outdoor recreation, and
- getting your indoor rec from The Library

If you make these changes, you'll magically find that within just 2-3 few years, you have wiped out the whole student loan. This will allow you to turn your attention to the house downpayment. At that point, the 20% savings will show up within a year and you will finally be in a position to really buy your first house.

But don't feel rushed to do so – if your active urban lifestyle is as fun as I predict it will be, you might choose to continue renting for much longer and using the money you'd normally spend on a house for investments instead. Perhaps even until you are financially independent 7-10 years later! At that point, you will be able to move to the locale of your dreams, buy a house with some of the spare change in your pocket, and let the good times roll.

This reader did not mention whether or not kids are planned for the future, but if they are, changes like this are even more powerful if they are made at this stage in a person's life. It is far easier to change your habits for the better and create a more efficient and less stressful lifestyle Right Now, than it is to do so once you have the added full-time job of one or more children around requiring all of your focus. Starting a family is much better done when you're out of debt and not dependent on multiple incomes for survival.

There are many paths you can enjoy, thanks to your new Mustachian take on life.. but all of them lead through the same initial bottleneck: eliminating your life-draining commute, and getting out of your Debt Emergency before making any more major purchases.

Best of luck, and if you like, keep us informed of how things are going as you make progress!

(And if any of our old case studies are out there reading, please write in through the contact form and let me know how things are for you too – many people have been asking about how you're doing!)

Is it Convenient? Would I Enjoy it? Wrong Question.

By Mr. Money Mustache

Tue, 18 Sep 2012 12:01:40 +0000

A recent paraphrase from a Beginner Mustachian:

> "Hey MMM. I can see the financial benefits of your lifestyle. But I just have different tastes. I like my better wine, and my husband really likes his books and his iPad. So we figure that if we would really enjoy something, we might as well get it. And, you know, at this stage we can really afford it."
> – *person who still has mortgage debt and a cost of living that will require them to work for the next 20 years*.

Mustachians like you and I are engaged in a lifelong process of increasing our wealth.

In the beginning stage, the goal is mostly monetary wealth, and I see no problem with that. Money is a big and exciting part of our culture. And most of us start out with our arms and legs tangled up in the stuff to the point that it is a source of stress, status, and a loss of autonomy. The need for money is forcing us to set alarm clocks and drive to other cities every morning, give up on the chance of raising our own kids, and sign up for terms of voluntary slavery that can extend 45 years or longer. When you arrive at the door of the Temple of Mustachianism in this condition, it is natural that you'll have your mind on your money and your money on your mind.

But as powerful as the problem of money seems to a beginner, there really is a solution. Applying the principles of this blog (or many of the other books and websites on financial independence) will almost certainly make you wealthy enough to be free from the need to work for money in a reasonable amount of time.

But then what? The pursuit of wealth still continues, but it just moves to the higher level of accumulating Life Wealth. Freedom, self-actualization, learning, generosity, and other fancy stuff that seems like an untouchable luxury to someone who is struggling to survive, will become your day-to-day challenge. And it's a happy place, although not one without its own pitfalls.

Now that I'm really old (38 next month), I've had a chance to study both sides for quite a few years. And there really is a pattern that shows up as people transition from desperate consumer to seasoned retiree.

That pattern could be summed up like this: "**Getting rich is more mental than it is tactical**".

When people first start reading up on how we're all becoming rich here, their first questions are ones like these:

> "How could I possibly live on 50% of my income? Or 25%?"
> "How can I cut costs? What are your top three tips?"
> "Why is your electric bill a third of mine, and your grocery bill half?"
> "How will you pay for your healthcare? Your son's education? Valuable travel experiences?"

They're all good questions. But you'll notice that they are *tactical* in nature. People want tips and recipes for saving money.

Solid tips are valuable resources, but they work a lot better if they are combined with changes to your *mind* that make the tips turn into real improvements in your lifestyle, rather than temporary deprivations which are simply means to the end of getting more money in the bank.

> "What do you mean, changes to my *mind?* We're all born with a certain mind, and it's fixed for our whole lifetimes. I just want the money-saving tips please, Mustache."

If you find yourself agreeing even remotely with that statement, I'm excited on your behalf, because it means we have a lot more to learn together.

Even if you've never heard of the ancient art of controlling your own mind, that doesn't mean your noggin is an untouched virgin which has never been modified. It just means that until this point, *someone else has been doing all the controlling*. Your cultural values and beliefs, your attitudes towards hard work and struggle, and virtually all of your desires to own anything, from a certain style of house to a vacation destination, have been programmed into you by the outside world. Most of your desires *are not your own!*

To balance the scale a little, all you need to do is understand that you can program your own mind in completely the opposite way. You can build habits, you can eliminate most of your irrational fears, and you can even eliminate most of your irrational desires. The idea of programming your own mind is extremely powerful, it has been practiced since even before the ancient Greeks (see: Stoicism), and it's relatively easy to do. And yet it's a practice so rare that the standard Joe Consumer type will think you are a magical superhero if you have the ability to do it. Don't believe me? Check out this quote:

> A man is rich in proportion to the number of things he can afford to let alone.
>
> *Old-time Mustachian H.D. Thoreau, 1817-1862*

Is this antique, folksy wisdom that no longer applies in the modern world now that iPads have been invented? Or is Thoreau actually a mind-control badass who figured something out that most people who have come after him have forgotten?

The answer is of course option b). You really ARE rich according to how many things you can train yourself NOT to want. But note that this is *completely different* than just perpetually wanting things, and aching inside every time you can't buy them. It's a much more powerful skill.

One of my friends has a $75,000 motorboat. I have more than enough money to buy a boat just like his and park it next to him in the marina. I wouldn't even have to come out of retirement to be able to afford this purchase. But yet somehow, I *don't even want a motorboat*. Even with ten times my current wealth, or one thousand times, I still would not want the boat, or a luxury car, or even a bigger house.

This freedom from desire is actually making me richer, because it allows me to focus on things other than things. And as it turns out, wanting less is an age-old recipe for having a *much* better life. But to believe it, you need to have control of your own mind at first. So let's start getting some of that control right now, with a couple of examples.

Let's suppose you want the latest iPad. You want it because it is convenient to be able to look at pictures and websites and books and play music around the house. Sure, you already have other computers that do those things, but the iPad is special because it lets you do them while holding it in one hand, sitting on the couch.

Wow, that couch is pretty convenient too, isn't it? It is comfortable, enjoyable, convenient, and joyful to sit and lie on your couch. In fact, wouldn't it be best to just lie on that couch all day? Forever? Yeah! Maybe you could even hook it up with a catheter and a bedpan, and a friend or robot could bring you all your food on the couch too. With each release, the latest iPad could be delivered to you, and you'd have the most convenient and comfortable and effort-free life ever.

Maybe you were with me for the first bit of that paragraph, but it probably lost its appeal by the time we reached the end, right? And indeed, with proper understanding, almost any consumer purchase (and almost any bad habit) these days, beyond the necessities, should start to sound like a catheter and a bedpan to you.

"I really like my Land Rover, and I deserve it because I'm a big executive now. It's much faster than biking those five miles to work. Especially since I don't want to arrive at work all sweaty". Uh-huh. And it's much more convenient than a compact hatchback, because you don't have to bend your knees to get into the driver's seat. And you no longer have to wait *a whole ten seconds* to accelerate to 60MPH, because it has a big enough engine to pull its enormous bulk to that speed in only six seconds. Would you, by any chance, like a catheter and a bedpan to go with that?

"I like running my A/C at 72 degrees, because it's just so nice to come in out of the Texas heat into a fresh, cool house. Then I do the laundry and use my electric clothes dryer to get crisp, hot clothes ready to wear without all

that hassle of hanging them up to dry". Uh-huh. If only your clothes were equipped with catheters and bedpans, then you'd really be set, wouldn't you!?

We could go on and on with this theme (and you're welcome to do so in the comments, because I find it pretty funny). But the bottom line is, virtually everything we buy is actually a form of false happiness, a slippery slope that ends at the catheter and the bedpan, and the earlier on the slope that you catch yourself, the richer and happier you will be.

Mental Exercise: The next time you really want to buy some sort of treat for yourself, whether it's a latte or a Mercedes, try the trick of <u>*not buying it*</u> *instead. Mockingly offer yourself a catheter and a bedpan as a substitute.*

Then over the coming months, make a note of your feelings of desire for that item you skipped. How do you feel about not owning it? Are you happy? What are you doing with the time and money that would have been spent in acquiring that item? How do you feel about the accomplishment of voluntarily controlling your urge to buy something? Do you feel more in control of your life in general? Repeat the experiment with more items over time, and note the change in your feelings

Once you master this basic mental framework, you are truly ready to breeze through the tactical aspect of getting rich. Now that you know that virtually no purchases, regardless of their convenience or enjoyability, will actually make you happier, you can instead make the decision based on whether or not you can afford it.

You just need a new definition of "can I afford it?"

If you still need to work for money, or at the very least, if you're not saving *at least* 50% of your take-home pay, you can not afford it. Where "it" is anything.

In certain cases, you will still buy things you can't afford. Groceries are a good example. A bike is another one, because like all good investments it earns you money rather than costing you. Housing, clothing, and plain old FUN with your friends and family are also things worth buying when you can’t afford them. But your decision-making process will simply be made differently – you’ll be maximizing the Lifetime Wealth delivered by each spending decision, rather than the convenience or short-term pleasure.

You’ll have more fun in both the short term and the long term. You just won’t have as much of that catheter-and-bedpan “convenience” we’ve all been spending our money on up to this point.

Only by gaining control of your mind and the conveyor belt of false desires it serves up, can you get true freedom in your life. Freedom, unlike convenience, can really bring happiness. It’s a bit dizzying, and maybe even a bit difficult. But once again, it is the *good* kind of difficulty.

So who is up for some difficulty?

A DIY Roof Rack: Make your Small Car Carry Big Stuff

By Mr. Money Mustache

Thu, 20 Sep 2012 20:36:52 +0000

The previous MMM car – a 2004 Subaru Impreza wagon. Those stock roof rails allowed either bikes or large pieces of lumber to be carried easily on the roof.

So you've got a small car now. It's a hatchback or wagon design, which allows you to carry bulky stuff as well as people. Thanks to that nice open interior space, you find you can easily carry 8-foot 2x4s home from the building materials store, as well as dressers and small appliances. Good for you!

But thanks to Mr. Money Mustache and other positive influences, you're getting more into home renovations and maintaining your own stuff these days. And unfortunately that means carrying much bigger things home. 4×8 sheets of plywood and drywall. Windows and doors. Long pieces of baseboard and trim. Even the occasional ladder, canoe and kayak.

Long ago, we covered some ideas on turning a little car into a big one. One of the tips was the idea of using a roof rack and optionally a roof box to expand your cargo area. But the problem with commercial roof racks (Yakima, Thule, etc.) is that they are designed for sports equipment and not building materials. Thus, they are typically very short. To carry long items without having the wind whip them around, you need a longer rack.

From about 2006-2011, I had the pleasure of hosting a golden old work truck that a friend lent me because he didn't have space to store it. It was a 1984 Nissan compact pickup, rusty yellowish-brown in color, and it went by the name "El Amarillo".

Although it had only a 6-foot cargo bed and about 50 horsepower of output from its old rattly engine, boy could that old truck do some work (and it still can to this day!) But in my house-building work I often had the need to carry 16-foot pieces of lumber and even 24-foot sticks of steel for welding projects. Neither are practical with any size of pickup truck without modifications.

Here's the Amarillo in 2005 BEFORE I welded on a roof rack and used it for five years. (It still looks just as good and runs like a champ today).

To solve this need, I built a 12-foot long roof rack for the Amarillo out of steel. It hung out a couple feet over the back of the truck, and extended all to the windshield at the front end. With a 12-foot rack, you can carry 24-foot material with a tolerable 6-foot overhang at each end, making it stable enough for a careful trip home from the metal store. And of course, carrying 16-footers and 4x8s with this rack was effortless.

In 2011 however, I returned the Amarillo and bought my current work van, a 1999 Honda Odyssey minivan. In most departments, it is a big upgrade: the three rear doors allow much more efficient loading, and the 160+ cubic foot cargo bay can hold some massive stuff (50 sheets of plywood fit easily, for example). And it locks up and keeps everything safe from rain and dirt. But I still haven't gotten around to making a real lumber rack for the new van. The Amarillo was old enough that my friend didn't mind me welding things right to the body. With the van, I will need to put a bit more finesse into it.

But that doesn't mean I can't carry big materials yet. This van, just like many smaller wagons and hatchbacks, came with **roof rails**. These are usually hollow aluminum tubes that are formed to the shape of the car and attached at several points. They are not much use by themselves, but they provide a base to which you can attach commercially-made crossbars, which can then hold accessories for skis, small kayaks, or mountain bikes. But those crossbars still don't help us carry big lumber.

Luckily, there is an extremely easy way to convert a roof rail system to a big rack system. And without the sometimes-major expense of a commercial roof rack. You just need to custom-fit your own rectangle of sturdy wood and strap it tightly to the existing roof rails.

As it turns out, I had to do exactly that to my own van this summer. My cottage construction project got to the point of baseboard installation, which is best purchased in the longest lengths possible. I was faced with the need to transport about 500 feet of long boards (in 14-foot lengths) along a 30-mile winding and high-speed journey through the Gatineau mountains of Quebec to get them to the cottage. I didn't want to do that with them hanging 6 feet out of the van's rear hatch, and I didn't want them to blow off in the wind. So I simply spent about 15 minutes screwing together some scrap wood to come up with the following contraption:

Top rear view of the homemade rack

If you look closely, you can see that I just had to snug a pair of 1″x5″ boards (2x4s work too) to the inside of the existing roof rails, then screw cross-pieces to each end of the rails to create a rigid square. Then, you can just use straps or bungees to attach the rack to the car/van, and leave those attached as long as you need the rack in place.

Strength is no problem with a rack like this – through the natural flex of the wood, it automatically distributes the weight right along the interior frame of the car's roof, which is located at the outside corners right under the stock roof rails. I have carried up to 500 pounds on racks of this style without adverse effects (although the car's cornering is affected by a top-heavy load, so take it slow).

If you care about the paint job on your roof (on my construction van, I generally do not), you can wedge bits of cardboard or carpet under the wood frame, or even attach permanent pads to the wood with hot glue before setting the rack in place. Here's a front view of the rack, strapped on with a ratcheting strap, and padded at the front by cardboard.

Front view

At this point, after a full 15 minutes of effort and perhaps $10 of supplies, you have a rack long enough to carry 16-foot material. Here's how I attached the baseboard to my new rack:

Side view – a huge bundle of 14 foot baseboards, easily secured to factory roof rails with no rack.

Since I needed this load to survive speeds of up to 65MPH, I deliberately biased the loading towards the rear. When you're driving at highway speed, there is a huge wall of air rushing upwards over the windshield. If you leave long floppy pieces of wood in this wind river, they will get pulled upwards and possibly even broken. Tailing from the rear, on the other hand, the lumber gets a smoother ride in the slipstream.

Tech Tip: The absolute key to safe carrying of lumber and other big stuff is *ratcheting straps*. They look like this and you should be able to find a 4-pack of them at Home Depot/Lowe's (Husky brand or similar) for $15-$20. You don't want to mess around with rope, string, tape, or even bungee cords except on the slowest and shortest of trips. This type of strap allows you to make a much tighter connection than even the strongest sailor could do with fancy knots and a rope.

The trip was a success, and I even saved the rack in a safe place so it will be waiting for me when I continue working on this cottage next summer. More importantly, I hope this plants an idea in your own head about ways to carry cargo without resorting to a pickup truck. When you buy a small hatchback or wagon for your next car, look for the presence of roof rails as an important added bonus.

Weekend Edition: Where do we Go Now?

By Mr. Money Mustache

Sat, 22 Sep 2012 23:04:47 +0000

Oh, Hi there.

It's the weekend, which means we can talk about whatever we like, with no pressure for life-changing articles. Whew.

I thought this would be a nice time to share a few bits of information on the state of this blog and of Mustachianism itself, with some speculation about the future as well.

1: Yay! 10,000 RSS Subscribers
At LAST, the semi-meaningless feedburner count (that orange logo on the right sidebar of the main page) has ticked above 10,000. Although it does not function as a count of how many people are reading the blog, it does at least correlate with the growth in readership. And I've always considered 10,000 to be a blog that had "really made it". So here we are.

Are you wondering what RSS even is? It stands for [Really Simple Syndication](), and it is a way that frequent website readers keep up with multiple blogs without having to visit the actual websites every day. If you use a personalized portal like [iGoogle](), you can arrange to have your Mr. Money Mustache articles appear aside your daily weather, news, stock updates, and other blogs feeds. RSS also makes reading on small-screen mobile devices convenient, if you use things like Feeddler for the iPhone or gReader for Android, or any number of thousands of other free options. If you ever need to, you can sign up for the MMM RSS feed [at this link]().

2: Whoa: 1.2 million Page Views per Month
Things have been getting crazy around here, with the site easily surpassing a million page views per month, and still growing due to crazy forwarding from users and media outlets. With numbers like that, anecdotal evidence suggests that this might soon become the biggest non-corporate-owned personal finance blog in the US. Or maybe not. But either way, it's worth celebrating all of those millions.

3. A plan for the future of Blog Moneymaking
As we've discussed in the past, people can make some real money off of these things. A blog with this traffic, appropriately spammified, could earn over $300,000 per year. Even with the current lower-key setup, I think the income has just hit $2000/month, matching the entirety of the MMM family's spending. So I thought it would be fun for us to make some plans together for this large and probably ever-growing amount of income.

- **3a)** Mr. and Mrs. Money Mustache shall get paid for working on the blog, although the amount shall not exceed $2000 per month, no matter how big it gets. I'm not sure why, but we still find it motivating to get paid at least a small salary for our work. Especially since the size of this blog job has displaced much of our other hobby activities, some of which provided (technically unneeded) income. However, the cash will end up being saved and invested anyway, with the scope and creativity of investments increasing over time.
- **3b)** The blog shall have a budget for paying for its own expenses (web hosting, science experiments, paying people to help with technical issues, any promotional/conference travel, etc.). Not to exceed $1000 per month except in extremely fun circumstances that you'll get to read about.
- **3c) 100% of all surplus income** beyond this level shall go to a new charitable fund called the Money Mustache Foundation, that will try to do good in the world. Articles on the details are coming up this week, but it's based on some reading I've been doing on the Gates foundation, and the book called The Life You Can Save.
- **3d)** To start out the Mustache Foundation, I've just transferred **$10,000 of the blog's past earnings** into a new investment account, where we can use it to generate some exciting returns, then use the proceeds for a

> series of ongoing donations. So we all get to learn about investing, AND efficient ways to donate surplus income over the coming months. If we're smart enough, we might even be able to figure out how to structure it as a trust or nonprofit in the longer-term.

It's an exciting next leg of this blog-writing journey, and I'm happy to have you along for the ride!

The Lending Club Experiment

By Mr. Money Mustache

Mon, 24 Sep 2012 12:00:08 +0000

It's time to dive in and explore some interesting new investment options.

I have some personal cash set aside, and the newly-minted Money Mustache Foundation has $10,000 of seed capital that we'd also like to put to work. On top of this, I have replaced the old $75,000 line of credit on my primary house with a new $200,000 one*, and the current balance is a comfortable Zero Dollars. So there is a sizeable keg of "dry powder" ready to put to work as opportunities come up.

Now, normally a conservative person saving for financial independence would simply be investing all surplus funds in a pre-arranged series of places every month. Assuming you have no emergency credit card or car loans, you might allocate the first chunk to 401(k) deductions, some to extra principal payoff on your mortgage or student loans, and the rest to index funds like Vanguard's VTSAX.

Update from 2017: *please enjoy this article, but I don't recommend actually investing with Lending Club until you review the latest results here. My experiment ended up going well for a few years, but returns have soured* *more recently so I would not recommend following in my path unless something changes.*

However, with my 401k already filled up, mortgages paid off, and a reasonable amount already allocated to index funds, I'm looking for learning opportunities with higher potential reward in exchange for more effort and risk. Some of the options under recent consideration include:

- Buying the junky-but-spacious rental house next door to me from the current owner, renovating it, and re-renting at a much higher rate. Or re-selling it for a quick profit.
- Buying an interesting building elsewhere in my own city (possibly on the Main Street) and owning a tiny slice of the town's commercial district, as a source of rental income
- Investing in some REIT funds for an expected annual dividend of 6-7%
- Trying an investment in Lending Club, where you indirectly lend money to other US borrowers at expected returns between 5.8 and 13% annually.

I've been intrigued by Lending Club ever since I read this post about it on my friend Brave New Life's fine early retirement blog. However, at the time the strategy seemed complicated, I didn't understand the risks, and I did not have much liquid cash looking for investments.

But over the past year, the investment picture has changed. Cash has accumulated, the US stock market has roared up to record levels (making lump-sum investing just a bit less appealing due to pricier valuation), and great deals on rental properties in my own area have been hard to come by after a sizzling summer of quick sales.

The final piece of the puzzle clicked in at a recent conference I attended in Denver. I got the chance to talk to some Lending Club employees in person about the company and its operations in detail. In summary, Lending Club is a San Francisco-based company founded in 2007 to function as a new, streamlined connection point for borrowers and lenders, replacing a portion of what banks and credit card companies do. It's high-tech, it is regulated by the Securities and Exchange commission, and it seems fairly honest and straightforward to me in the way it conducts its marketing. After a year of sniffing around its foundations, I decided it was time to try it out.

So I got an account, scheduled a transfer of $10,000, and then did some reading during the five days I waited for those funds to clear.

Brave New Life's strategy was a good starting point: he used a website called "lendstats.com" to mine 5 years of Lending Club loan data, in order to design a filter which would find him the best range of loans in which to invest. Copying his ideas, I found that the highest historical return was obtained by selecting the *riskier* investments (credit grades D and below), and further optimization was possible by doing things like excluding renters, insisting on employment history of at least four years, skipping loans from borrowers in California and Nevada, etc.

So I logged into my new Lending Club and implemented the same filter there. By checking and unchecking various boxes on Lending club investment screen, I was able to include and exclude loan applications (called "Notes") with various characteristics. Each time I adjusted my filters, an adjusted list of qualifying notes would appear – usually somewhere between 200 and 1200 notes. At that point, I was able to click "select all", and Lending Club would present me with a summary that looked like this:

[A summary of the notes I selected
(click for larger)]

Hey! That was an unexpected result. I could see that Lending club was automatically calculating the average interest rate of all of my proposed loans, subtracting the expected default rate based on their 5-year history of thousands of other loans with these characteristics, and presenting me with an estimated final rate of return (13.07% annually in this case). In other words, the site was doing its OWN data mining for me, making that third-party lendstats page I mentioned earlier redundant as far as I can tell.

So I was almost ready to invest. The only question was whether to use the manual loan selection method shown above, or the automatic "Build Portfolio" feature provided on your home screen when you first log into Lending Club. Here's an example of what that looks like:

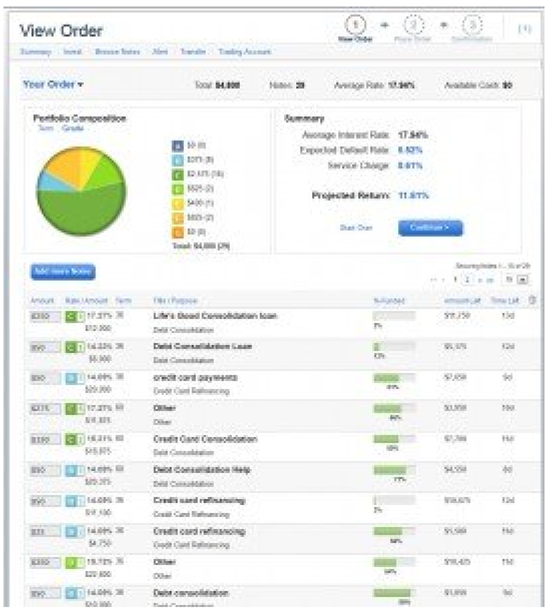
It looks clean and simple, and when you click any of those nicely-colored "Option 1/2/3" buttons, you'll get a summary of net investment returns after fees and projected defaults. At 13.03%, Option 3 corresponds very closely with the 13.07% net return projected in my manual portfolio screenshot above, because as you can see it does most of its investing in the lower-grade, higher-yielding loans.

The key difference is that when I requested that my full $10,000 portfolio be invested in Option 3, it ended up allocating the whole 'stash across only 60 notes. That's $166 per note, more than six times the minimum $25-per-note investment. With all other things being equal, I would prefer to spread the capital across the greatest number of qualifying loans, because it will reduce the "unique risk" in my portfolio without decreasing returns.

As noted in Lending Club's own marketing materials, the larger your number of notes, the more your performance will trend towards the projected returns, with fewer surprises. In fact, among investors with 800 notes or more, *every single investor* has made a positive return from Lending Club, with 93% of them in the 6-18% range depending on their loan grade choices.

To resolve this discrepancy and test my hypothesis, I made two separate investments so we can track them separately:

- The first $5200 went to in my manual portfolio of 208 loans of grade D and lower, filtered for borrowers with no delinquencies in the past two years (because that was the only filter I could find that improved the projected results noticeably). 208 was the maximum number of matching loans available at the moment.. projected return after defaults: **13.07% annually.**
- The remaining $4800 went to the default Lending Club high-yield "Option 3 portfolio" of 29 loans of slightly higher average grade, projected yield **11.81%.**



Here's the lending club default portfolio for "option 3"

I'm guessing that my manual portfolio will be both higher-yielding and less variable from the projection, if I understand the statistics correctly. But we will all get to see over time – I'll provide regular updates as these loans pay us back principal and interest, AND we use the gains to learn about some charitable giving options.

Update, 16 Months Later: I assigned each of these purchases to a different portfolio and have been keeping an eye on them. It looks like my custom portfolio with 208 notes is so far performing *slightly worse* than the Lending Club automatic selection! My portfolio has seen more defaults, which more than eats away my interest rate advantage. However, the LC selection has many more late notes at this point, meaning they might fall behind in the next few months. Stay tuned.

MMM Portfolio:
Weighted Average Interest Rate: 20.43%
Defaults and chargeoffs: 4.8%
Late in any stage: 1.7%

LC Portfolio:
Weighted Average Interest Rate: 18.24%
Defaults and Chargeoffs: 0%
Late in any stage: 13%

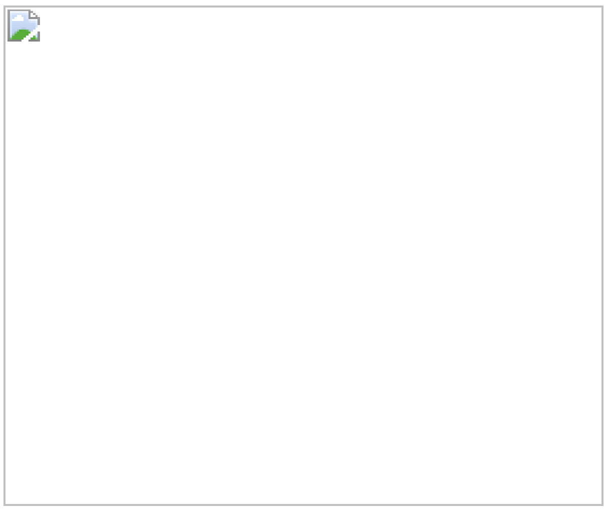
I am finding this Lending Club research to be a fascinating experiment in the field of applied statistics. When you look around the web to see what other financial bloggers have said about the service, you run into a raft of interesting opinions and techniques, bordering on witchcraft and sorcery. People will say things like "I am excluding borrowers who are consolidating credit card debt, or buying a new vehicle, because those are just recipes for disaster". Or, "I'm avoiding the D through F grades, investing only in A-grade notes, because those are the safest".

Points like those are intuitively satisfying, but when it comes to statistics, you have to ignore your intuition and look at the numbers. Lending Club has *already run the numbers for you*, and they factor the historical default rate as part of the projected return. Unless you are able to predict a drastic change in the pattern that has developed over the past five years (and over $813 million of loans and repayments even through the 2008 financial crisis), the math suggests you're better off learning from the trend rather than trying to apply intuition. And the trend is that the higher-interest-rate loans tend to provide a higher return, even after accounting for defaults.

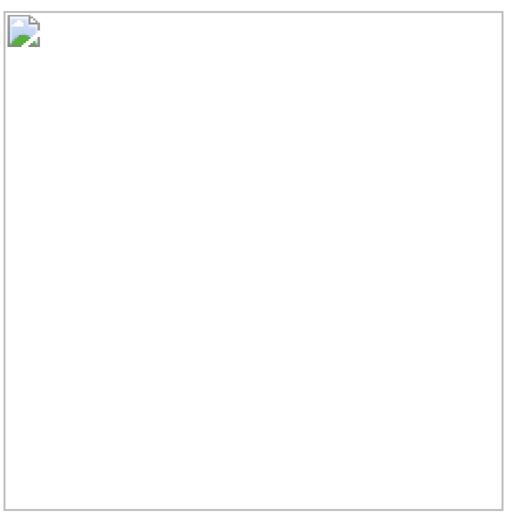
That is exactly why credit card companies make ridiculous profits, and if this experiment succeeds, it is also why Mustachians may be able to earn 13% annual returns by replacing the credit card companies in the role of Risky Lender**.

So it is exciting to me, because the reward is potentially much higher than the stock market, and the risk may be higher too (especially if I've done my research wrong!). I'll be watching every dollar that rolls in on these loans, and adding more to the investment over time as blog income permits.

If you'd like to follow along and try your own Lending Club investments at any point, I'm providing the following link to the service (it's an affiliate link, meaning the blog gets $25 if you do end up creating an account):



If you happen to be on the borrowing end of things, there's even a link for that:



Either way, do your research and be aware of risk. If you already have a friend who uses Lending Club, you could ask them for a referral link too – some existing members have the ability to generate $100 referral bonuses for a limited number of friends.

Update! This experiment is ongoing. Read more about it with these other articles in the series:

[The Lending Club Experiment – Four Months Later]

[The MMM Lending Club Headquarters – where it stands today]

Footnotes:

** I signed up for the new home equity line of credit in June, after interviewing and comparing rates and fees of all the major banks. The winner ended up being a local credit union that was originally founded to help Colorado University faculty, and it has been a pleasure dealing with them.*

*** I'm sure there will be questions about the ethics of lending money at high interest rates. After all, I feel that credit card companies are often predatory in their own lending practices. The quick answer might be to look at the net economic effect of investing in Lending Club. By increasing the pool of investors, you'll tend to drive down interest rates for borrowers, and lower the share of loans that go to credit card companies. This might increase the desirability of borrowing to some people (which I'd say is a bad thing), but on the other hand, it decreases the prevalence of extremely high interest rates, flattening the spread to a level that might become more economically efficient (good). Plus, the proceeds go to you. What will YOU use the income for? Will it provide a net societal benefit greater than that which a bank or credit card company could produce with those profits? It's an interesting question to ponder.*

Lighting Up the Bikes for the Darker Half of the Year

By Mr. Money Mustache

Wed, 26 Sep 2012 15:33:26 +0000

You may have noticed that September 21st just passed. The Fall Equinox snuck up on me recently and Mrs. Money Mustache and I suddenly found ourselves riding our bikes home from various events in the dark. Since there's no such thing as a "biking season" and a "non-biking season", that means we had to adapt ourselves to the changing conditions. This reminded me that the same thing might be happening to You, too.

For the past few years, we had been making do with old LED camping headlights as our source of night-time bicycle illumination. They did the job, but this year with all three of the family members on bikes, I decided it was time for a safer and more visible arrangement. It took a bit of research, but I found some bike lights that seem to be a good mix of performance, convenience and price. Instead of hoarding the findings for myself, I figured I might as well share them here in case you are in the same boat.

It can actually be a bit tricky to choose the right light system, because these days you can set yourself back anywhere from $1.99 to $600 in the process. The two dollar light might help you be seen as you weave your way home from the pub, but it won't light up much of the road in front of you, and it will probably use only a disposable watch battery as its power source. The

$600 light will blaze up the entire mountainside (as well as the next few closest mountains in the range) as you plummet through the 2000 foot descents in those all-night mountain bike races. But it will require fussy mounting, weigh in at almost two pounds, and the battery depreciation alone will raise your cost per mile of cycling to almost Lexus levels.

In the middle of this range are some happy lights, but mounting and charging options are inconsistent, and meaningful measurements of light output are sometimes non-existent. So I did my best, bought three systems for the family bikes, and I got lucky because the results have been great.

I selected one fancier high-intensity light for Adult rides, like my own night-time grocery runs or times when I find myself needing to ride home from Boulder at 2AM on a January night. Then I got two other lights for use around town. As a family, we generally don't need to go further than about two miles after dark. Visiting friends, the library, a night event at school or a play downtown. So it would have been overkill to buy three of the bigger lights.

To keep it short, here's what I ended up with:

The bright one: **Niterider Minewt 150/Cherry Bomb Combo***. It's a front and back light combo set for $70.
This is a handlebar-mounted light with an internal Lithium battery that you can charge with any USB cable (and it comes with a power adapter and cable too). Runs for 3 hours on maximum brightness, 4 on medium, 6 hours on minimum. Subjective evaluation after using for a couple of weeks: Pretty Effing Bright, and I wish these were invented back in my work commuting days! It also came with a similarly kickass rear flasher that makes your bike look like a police car.

The normal ones: **Niterider Mako 3.0/Taillight 5.0 Combo** (front and back set for $20).
The format is the same, but the lights are just not as bright. The "Mako" front light has exactly the same handlebar mount as the Minewt above. But it takes 2 AA batteries (just use your own high-power rechargeables in it once the provided alkalines expire).

Claimed run-time is 50 hours on solid mode, 100 on flash, but I bet this is bad documentation on their part – those sound about right for the *rear* flasher portion of this set. Since the headlight brightness is almost the same as the MiNewt on low, I'm going to guess about 6 hours of run-time between chargings (to be updated after further riding!).

I find it is still bright enough for 20MPH riding on roads and bike paths, it just doesn't shine hundreds of feet ahead like the bigger light. Similarly, the rear flasher is just the standard brightness that most cyclists have, as opposed to the "Holy Shit! What is *THAT!?*" effect of the Cherry bomb in the pricier set. Significant Bonus: the Mako light has a flashing mode that the Minewt lacks, allowing a highly noticeable "police car" effect from the front as well, if you are riding somewhere with enough ambient light and you want yourself to be more visible. It even works during daylight hours.

To top off this review and make it more quantitative, I took the lights down to the Money Mustache Lighting Laboratory to measure the light output and take a few photos of light output for comparison. Here's what I came up with:

Light Name	**Brightness @Beam Center (Lux reflected from white wall @12 feet)**	**What it Looks Like**
Typical LED camping headlamp	3	Mako 3.0 Bike Light	29	

Light Name	Brightness @Beam Center (Lux reflected from white wall @12 feet)	What it Looks Like
Minewt on Low Mode	35	
Minewt: Medium Mode	68	
Minewt: High Mode	136	

Pictures were taken with an SLR camera with fixed aperature/shutter settings, so the camera would not automatically adjust to the different light levels to make them all look the same.

Overall, we are all pleased with our new lights and they are already in heavy use. The handy thing about these lights is that they all use the same handlebar mounting bracket. So the super-bright light can be fitted to any of our three bikes as night-time errands require. And when all lights are not all needed, Junior ‘stash has taken to attaching BOTH of the Mako3.0 lights to his own handlebars and setting them to flash mode, for maxiumum Police Car mode. That’s fine with me, since a visible kid is a safer kid.

Advanced Option: After publishing this, many readers piped up and taught me that even my 150-lumen light isn't all that bright. A car headlamp, for example, is about 3000 lumens, although your pupils automatically dilate to compress changing light levels it doesn't actually appear 20 times brighter. You can get a set of three 200-lumen LED flashlights with batteries for about $20 at Costco, and you can get 700+ lumen lights at dealextreme.com: http://dx.com/s/magicshine

Just note that while you *will* get more brightness for your dollar, the mounting system may be a bit more fussy, so this option is better for people who enjoy light mechanical tinkering.

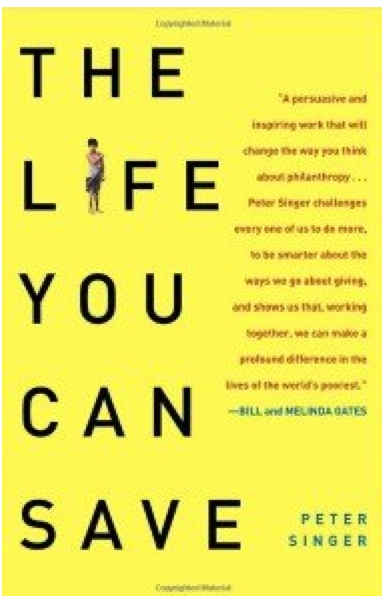
Also on this topic (from last November): How to Ride your Bike All Winter – And Love it

**As usual, I've used commission-paying links that Nashbar provided to me for these lights, since it does not affect the price to readers.*

Weekend Edition: The Life You Can Save

By Mr. Money Mustache

Sat, 29 Sep 2012 17:59:53 +0000



As a Mustachian, you are bound to get richer over time, even as your cravings for expensive manufactured stuff gradually fade away. If you haven't seen this happening yet, don't worry – it is inevitable, and you'll love it. But eventually, the end result is likely to be a surplus of savings, a certain amount of unnecessary income, and the continued desire to put it to work.

The thing is, "putting it to work", just like "rich", means different things to different people. So at the recommendation of some MMM readers, I just read an interesting book called "The Life you Can Save". Written by Peter Singer, an Australian-born philosopher and professor at Princeton University, this book has been creating a pretty big stir in the few years since its release.

I read it in search of perspective on how to give to charitable causes in an efficient way. As a newcomer to any serious form of giving, I figured it would be good to learn from people who have done it for all of their lives. But I got a bit more than I bargained for. Singer not only explains in detail what type of charitable giving allows your dollars to go furthest, but he lays out a powerful logical argument for *why* it is worthwhile doing in the first place.

To explain the basic premise of the book, let's have an **imaginary version of Peter Singer** participate in an interview with an imaginary past version of myself (we'll call him Mr. Non-Charitable Money Mustache), to see how he answers my questions.

NCMM: "I like the idea of helping people, but I'm kinda busy leading my own life. Why should I care about helping those I don't know?"

Peter Singer: "Put it this way: if you were out on a hike, and you saw a small child falling into a pond, starting to drown.. would you wade in and save the child?"

NCMM: Well yeah, of course.

Peter Singer: Now what if you were on your way to work and the same thing happened. To save the child's life, you'd have to ruin your nice work clothes and maybe even miss an hour of work while you get cleaned up. Would you save the child's life then?"

NCMM: Yes again.. but that's a real kid there that I can see. Of course I'd save her. But charitable work often involves people you'll never meet. Maybe even in other countries.

Singer: Imagine you're on a lifeboat, and the titanic has just sunk. People are swimming all around you. You can save five lives. There's one person floating off in one direction, and there are five people stuck under an overturned lifeboat in the other direction, so you can't see them. But you know they are alive and can be saved. Given only one choice, which direction would you row?

NCMM: OK, you got me there. But wait a minute. Does saving lives really help the world, given that we are way overpopulated already? Won't a person "saved" now just die of starvation next year, or decrease the wellbeing of all the remaining living people so there is no net gain?

Singer: Actually, the effect is the opposite. Saving lives (decreasing childhood mortality) has a very powerful effect in reducing the birth rate in developing countries. Mothers become less afraid of losing children, so they have fewer of them. Also, as the education and productivity of societies rises, the birth rate drops. This has been scientifically documented and the effect is enormous – so powerful that most rich countries actually have shrinking populations based on birth rate alone – immigration is the only thing that provides net growth.

NCMM: All right. But wouldn't my contributions just be a drop in the bucket, in a hopeless sea of needy people?

Singer: No, but you've hit on a classic problem with human behavior: diffusion of responsibility. If a single person sees an injustice being committed, like a thief or a child drowning, he is very likely to step in and help. However, if a crowd witnesses the event, the help becomes much less likely, even though there are more people available to help. And if there is a real cost to helping out, the problem becomes more extreme: people don't want to contribute their fair share, if they see the rest of the crowd not doing the same.

NCMM: Let's assume I can get past all the barriers and I decide to get into charitable giving. Where will it go furthest? Would it be donating to help low-income families in my own community? Or for those who are part of a church, donating to their church? It seems that overall in the US, many people are involved in these things.

Singer: Unfortunately, while the US population is slightly more generous than the average rich country when measured in absolute donations, it is one of the least generous when measured in helping those who need it most – the people of the poorest countries. When you donate locally, you are still doing some good, no doubt about it. But when you help someone in, say, a really poor village in Rwanda, you are saving people from decades of debilitating diseases – things like missing limbs or a lifetime without being able to breathe properly. The needs are just staggeringly higher, and the cost of solving them is much lower. If you have a strong stomach, look up "fistula" and see what millions of women are living with for lack of a 20 minute surgery. I've estimated that an entire human life is saved for each $200 donated to the right organizations. And in fact, if the wealthiest one percent of the world were willing to give just 5 percent of their wealth to the cause of eliminating extreme poverty, it would be sufficient to pretty much wipe it out within one generation.

NCMM: But what about the "give a man a fish and he'll eat for a day, teach him how to fish and he'll eat forever" paradox? Isn't foreign aid ineffective?

Singer: Yes, it can definitely be ineffective. When we ship our surplus crops to poor countries, we allow temporary eating, but destroy the country's local farming industry in the process. If we provide money to prop up lazy governments, a country may never develop the ability to produce for their own needs. So, effective aid is usually targeted in the "teaching how to fish" category. Vaccination against disease allows people to be more productive through their lifetimes. Drilling a central water pump for a village will save labor previously wasted on hauling unsafe water from miles-away rivers. Providing solar power systems can allow villages to benefit from electricity without waiting decades for a national power grid to be made. And microlending organizations allow people to start businesses without resorting to dangerous loansharks which are currently the only source of investment capital for some.

MMM: All right, this has been pretty convincing, and I definitely feel better about having most of my own charitable contributions go towards world poverty. I may still do some "luxury giving", like helping out my own elementary schools, but that is sort of the icing on the cake that provides motivation for the real work. What organizations do you recommend as most effective for people who share this goal?

Singer: This scene has brightened in recent years, and you can now go to GiveWell.org and pick efficient charities from their list. They in turn evaluate and recommend groups like the Against Malaria Foundation, Schistosomiasis Control Initiative, Small Enterprise Foundation, and many others you can browse through. On top of this, Oxfam, Unicef, and The Hunger Project are effective organizations.

—

So where does this leave the typical person saving for early retirement?

The point of this article is definitely not to throw a monkey wrench into your plans for financial independence, or to create any sort of guilty feelings. Singer himself suggests that it's a good thing that Warren Buffett did not choose to give away his first million dollars to charity, because it was the seed from which he has built over $50 **billion** dollars which will eventually go to eliminating poverty (via the Gates foundation). On top of that, there is a logical case for not giving too much of a rich country's GDP away at once, because some of our luxuries (nutritious food, fast transportation, and fancy computers) are precisely which let us become so productive that we can generate sufficient wealth to help the rest of the world.

Taken to extremes, the Peter Singer ethical argument can lead to bizarre outcomes. For example, he suggests that people should not value the comfort of their own children more than the lives of the children of other people, which could lead to some very barebones parenting if taken literally. Luckily he reconciles the viewpoint at the end of the book by suggesting a simple scale: allocate only 1% of your first $105,000 of income to charity, 10% of your next 100,000, and so on.

If I were to add my own twist try to make sense to all of this, I would throw in some Richard Dawkins: we're all really just collections of selfish genes, and it is in our nature to care more about people in our family than people outside of it, and people in our community more than people outside of it. The reason is that our genes are more likely represented in our family, and our chance of successful reproduction improves as we have a well-knit community. So don't be ashamed of your human nature, or your natural desire to help yourself first.

BUT.. as people studying happiness in some depth, we have an advantage in that we have a greater understanding of what "helping ourselves" really means. For example, I have found that regardless of how selfish I choose to be in living my own life, my material desires simply don't extend beyond about $2000 per month. That is why it was an easy decision to commit to donate a potentially unlimited amount of future income to charity in the future (with the very small $10k amount already allocated). It's because I can do it without having to sacrifice anything at all! (And of course because giving is very rewarding for its own sake).

If we could get more of the world's rich people to grow similarly bored with spending so much on themselves and their immediate families, the effects on society would be astounding.

So there's the message I took from this very influential book. Whether you relate more closely to Peter Singer or Mr. Money Mustache, the message is the same: if you really evaluate the marginal benefit of spending money on yourself once your needs are met, and you learn about the other options for putting your money to use, you may be in for some beautiful results.

elsewhere on the web:
Peter Singer has been everywhere and talked to everyone about this. Even Stephen Colbert: http://www.colbertnation.com/the-colbert-report-videos/221466/march-12-2009/peter-singer

Quitting a Cash Cow Job

By Mr. Money Mustache

Mon, 01 Oct 2012 12:00:51 +0000

A new season begins in the Mustache household

Mrs. Money Mustache has done it again – she just retired from another cushy part-time job. The dress code was pajamas, the working environment was a sunny second-floor office in our house, and health insurance, internet access, and cell phone with data access were covered by the company. She even had regular food deliveries during her short and irregular work days, cooked up by Mr. Money Mustache himself.

For the past few years, she has had varied responsibilities in a business owned by her family: snipping through the red tape of hiring and paying high-tech consultants working in many different states, administering the company's health-insurance plan, and finding and fixing financial and accounting errors throughout the company. It was a role she was very good at, which is why the company enticed her to stay so long. But the work was almost perfectly out of alignment with her natural interests, meaning every day was a source of background stress and dissatisfaction. Still she soldiered on, out of a desire to help her family with their cherished business, and because, hey, who could complain about a job with flexible hours that you can do from home – extra money is nice even if you don't need it, isn't it?

Over the past few years, she has made halfhearted attempts to shed this job, by training other people take over parts of her work. Work hours would drop, salary would be reduced accordingly.. But she kept getting pulled back in due to her own excessive competence. But finally, due to her desire to leave and a shrinking consultant base in general, this year the company decided to officially close down its small US operation (the main Canadian branch will remain). She will be entirely free, since there will be no problems left to solve!

This has been exciting and motivating for the MMM family. Mrs. MM will no longer have the slight but constant nagging that she should be getting something done on the computer, which has tended to lead to entire days being spent in front of the thing. She is excited to be forced out into the real world, to plan every day according to what really *should* be done.

We also had to solve a few practical considerations in the wake of this job's disappearance, including these:

- We signed up for a new **high-deductible health insurance** plan on at our own expense. It comes out to $239/month for the family, and it will get its own article very soon, since it is already leading to some learning about saving money on medical costs when you're paying out of your own pocket.
- We are ditching the expensive AT&T family **mobile phone plan** (two iPhones with data), keeping the phones, and activating them on a plan that will cover our needs for closer to $10 per person per month (another article on that shall be written as well).
- And we cut our **internet bill** in half by sharing the connection with a friend using a long-range wifi antenna.
- Since we still have other business interests (carpentry, real estate, this blog, small bits of creative consulting, and other stuff), we still maintain a company of our own (it's an LLC). This company will take over the job of paying for our health insurance, phones, internet, and

some other computer, travel, and photography niceties, meaning that they will be tax-deductible expenses.. one of the joys of self employment.

Another interesting consideration that came out of this is **unemployment insurance**. Since the company is shutting down, Mrs. MM is really being laid off rather than quitting, which technically makes her eligible for unemployment insurance. So we *could* be receiving $513 per week for six months or more according to the Colorado unemployment benefits calculator.

But, as you might have guessed, she won't be applying. The obvious reason is that she is choosing to retire voluntarily and won't be looking for more work. Thus, going on the dole would be violating the rules of the program.

Plus there's another reason: After handling her own company's unemployment insurance paperwork for years, we know how the system works: Employers pay insurance premiums into a pool *according to how many past claims have been made* by that company, and that industry in general. If more people claim it, employer premiums go up over time – the money does not simply come from nowhere. So if we claim for unemployment insurance, we're taking money out of the pockets of a pool of future employers. Not exactly my idea of a social good.

In an ideal world, there would be much less need for unemployment insurance, except in the cases like sudden injury or disability. Each new entrant to the workforce would start by saving as much of their paychecks as possible, never voluntarily going into debt or financial obligations that require a steady stream of income. But that would require an extremely Mustachian society, which will take us at least a few more years to create. We'll be patient for now.

The most significant part of this latest retirement, will be the life lessons and adventures that come out of it. Among other things, Mrs. M. is looking forward to new activities including:

- becoming a part-time instructor at the crossfit gym she frequents

- following a weekly schedule which includes time for gardening and hiking
- considering new business ideas in the areas that really interest her (and maybe partnering up with me on some of them)
- writing her own blog articles like this one instead of me having to write one about her

Every time I’ve resigned from a job, I have always questioned my wisdom, as I was giving up pay and benefits that many would be envious of, and entering into an unknown situation. But in each case, it has led to a better life as I have been forced to do new things, step out of my comfort zone, and generally live life closer to the way it was meant to be lived. As a dude who is generally too cautious by nature, any added adventure provides a definite boost to my existence.

Today is her first day of Funemployment. And thus, I am excited for Mrs. Money Mustache as she blasts into this next stage of her life. Congratulations to another early retiree!

The Practical Benefits of Outrageous Optimism

By Mr. Money Mustache

Wed, 03 Oct 2012 15:14:00 +0000

If you ask me, everything is pretty fucking great these days.

Your life and my life are both going to continue to increase in awesomeness over time. We are likely to have exceptional fortune and health throughout our days, we'll help to change some lives for the better, our kids are going to turn out loving and great, and we will die with a broad smile across our rugged and weather-worn faces somewhere around the age of a hundred and twenty two.

Oh sure, there will be the odd problem and catastrophe along the way, but they will just serve as recharging jolts to keep us from getting complacent. More problems to solve, more learning to do, and deeper happiness to attain. On top of that, the human race is bound for an ever-better fate, ironing out most of its current problems and most of the problems that follow in the future, ending up at a tantalizing Star Trek Utopia.

Those are pretty controversial statements to make these days, yet strangely enough the general theme tends to become true, for the few people who are crazy enough to believe it.

And most of us don't believe it. In fact, many of us end up going completely the opposite way.

One of the problems with being a clever and analytical person like yourself, is that you've become very good at seeing *what might go wrong*. You can see the risks inherent in any enterprise, and if you've got enough Cliff Claven in you, you might even be fond of expounding about those risks to anyone around who will listen.

There are even people who make whole careers of this. Fear-mongering in general tends to make you sound smart, and fearful people get a quirky sort of reassurance by snuggling up to a fearful leader, and confidently predicting the worst possible outcome. Dmitri Orlov gets lots of attention by continuously foretelling the complete collapse of the United States. Peter Schiff focuses on financial collapse, gaining fame for correctly predicting the 2009 financial crisis, then incorrectly predicting doom ever since as the US economy has roared to record productivity in all dimensions – now one of the longest expansions in history.

A favorite technique of Collapse Theorists is to sit at the news screen, interpreting each development as still further evidence of their theory. "Oh.. now the politicians are arguing. Sure sign of collapse. National debt is growing.. collapse. Oil consumption rising faster than supply.. just as I predicted, ’twas foretold, ’twas foretold.”

The same methods can be applied by a Personal Collapse Theorist. “Oh man, this job is stressing me out. My department is going down the shitter, and we’ll be the first ones on the chopping block when the next round of layoffs comes. And it will be coming SOON! … And the thing is, in THIS ECONOMY, I need to hold onto my job because there are no other ones out there. Not in my field, anyway. All this is really taking a toll on my health. I’ve got bad knees and back, and they really flare up when I am stressed. So they are getting worse every day, which makes me even more stressed, which makes me even worse at my job, which makes me even more likely to get laid off, which ….”

Whew, it hurt my fingers even to type that paragraph above, even though it was all completely made up. But it hurts because it’s true – some people actually say things like that on a regular basis. And every time I hear it, I feel like grasping the person’s head between my hands and shaking it while I say, ***“Wake up, Dude! You’re doing more than just discussing your situation right now.. You’re creating your own reality!”***

Let’s contrast the life of the Personal Collapse person to the fate of a really lucky person. You probably know at least one person that is just so lucky that they annoy you. The person has a better job than you, always seems to get promotions, has cooler friends, and maybe even a more attractive spouse and a greener lawn.

Some even accuse plain old Mr. Money Mustache of being annoying for the same reasons.

“Oh, enough from you Mustache. You retired early and then things seem to keep going well for you. You’re making it all up, or if you’re not, it’s just luck and it can’t be applied to me”

Fair enough. Let’s stop the fakeypants Fresh-From-the-Tanning-Salon-Self-Help-Guru spiel right now.

We're all scientists here, so we can acknowledge that luck, or the partially random distribution of life situations, does indeed play a part in how a person's life turns out. There's the genetic lottery, where each person gets different abilities directly from their parents, then there is upbringing, family, location, and pure random events supplied by the outside world. It's bound to create a very diverse set of results, right?

But if you've ever been to a bar and watched a less-attractive friend have far greater success in attracting mates, or worked in an office where you notice that many of the people in highly paid senior positions are less competent and intelligent than yourself, you know there is something fishy about the theory that luck and birthright alone deliver our fate.

And that's where we get to the secret weapon of Optimism that I've brought to you today.

I'm hefting a stainless steel case onto the table and undoing the latches for you now. It's lined with black velvet and as I open it up, both of our faces light up with golden light, just like when they opened Marsellus Wallace's Briefcase in Pulp Fiction.

Inside is a very smooth, very polished tool that looks like it was crafted by an advanced alien race. It is made of gold and silver materials, with a sculpted handle and cobalt blue trigger. It's your new Optimism Gun.

But what good is a fictional asset like an Optimism Gun when we're trying to accomplish things here in the real world?

The answer is **a Hell of a lot of good**, because in this world full of humans, almost all of our "reality" is created in our own heads.

Is money real? No, it's just a shared understanding among all of us that we agree to store value in nontangible forms. What about Gold, that's more real than money, right? Nope – offer a pile of gold coins and a nice chunk of meat to a dog, and see which one he chooses. Fame, fortune, the respect of others, or a job as President of the United States? Just chemical patterns stored in the minds of a bunch of other humans.

Even physical problems, like immediately cutting human carbon emissions by 75% to reduce climate change or eliminating poverty in all poor countries, are things that could be solved within months, just by altering patterns in a bunch of human minds. And as it turns out, the human mind is exactly the target of the Optimism Gun.

But does it really work?

I found my own Gun about 21 years ago and I have certainly found it effective whenever I had the courage to apply it. It has helped me get an offer for every job I have ever applied to, earn and save more money than the pessimists assumed possible, have a very nice family life, and be generally happy every day, as I'm sure you've heard more than enough.

I also secretly use the OG in this blog (in fact, I'm typing this article on the Bluetooth keyboard that was supplied with the device). And I'd argue that it is working here too, evidenced by the ridiculous spread of Mustachianism to date.

Because which is more likely: that a software engineer who didn't even take an English class in university just happens to be the *most amazing writer in the world with the most useful financial ideas as well*? Or that this blog just makes people feel good about their lives because it is much more optimistic than other writing on the topic, and this motivates them to try some new things?

There are several psychological principles at work that make all this work on a practical level:

1: Humans are automatically drawn to Leaders: Most people just want to hang back with the crowd and shy away from pressure of standing out. As soon as somebody stands on the box and picks up the conch, people start listening. If you dare to express optimism about anything, you're stepping onto a little soapbox, and it gets attention.

2: People want it to be true: If you've become a small-time leader and you deliver the Good Word, people will naturally want to keep listening, because you help them feel good about things too. Soon your leadership position will start to grow a lot bigger.

3: Optimism tricks you into trying more things: If you believe success is almost guaranteed, you're going to try some pretty fun ventures. In reality, sure, you fail at some things, but what do they always tell us is the best teacher? That's right, it's failure. So you end up racking up much more hard-earned experience and knowledge than the non-optimist.Then what do you do with all that extra knowledge? You succeed. Meanwhile, everyone else is still hesitating to try the first thing.

4: You are forced not to focus on things you can't control: One of the most useful lessons of "The Seven Habits of Highly Effective People" is that you *never* worry about stuff you cannot control. You just work on the things you can.As an example, I never watch the political debates or follow the polls for an upcoming presidential election. That doesn't help me at all, and it doesn't help *you* either. Instead, I just *read* the descriptions of the policies each candidate plans to put into place, evaluate those against my best guess at their long-term effects on the success of the world in general (not just based on my own situation), then send in my mail-in ballot long before the election day. Then I can be optimistic because I've had my full say by voting, and I have hundreds of hours freed up to accomplish other things while the pessimists are still watching TV and worrying about the election!

5: Acknowledge and Bow Down to the Placebo Effect: When it comes to health and well-being, the mind controls the body way more than rational people like to admit*.This isn't just new-age medicine – the very *thought* of taking medicine that makes people better, has a statistically significant effect on the outcome of medical tests. It is so real, that scientists have to adjust for it by giving people *fake pills,* which make them better, in order to see if the real pills do even more than the fake ones.

I enjoy hacking this fact to control my own health. I have a permanent belief that I am unusually healthy, and that this condition will persist forever. Even when I get sick, I look at it as a very temporary anomaly, always assuming I'll be back to full health by the next day. It usually proves to be true. Not only am I overdosing on the placebo effect, but these assumptions lead me to do the deliberate things one would do if one were preparing for a healthy 122-year lifespan as well. And on top of all this, the optimism is limiting the release of the human stress hormone Cortisol, which tends to destroy health.

The less you worry about health, the healthier you become.

6: Optimism is rare, and deadly when combined with competence: If you're a smart guy or gal at your workplace, the other smart people are expecting you to be pessimistic, just like them. You can sit at the lunch table, discussing the chronic failures of management or the critically flawed design of the product you're all working on.But once you've proven your pessimism/realism chops and are respected by the gang, then you gradually start playing some tricks. You can slip in ideas like "Well, this project might actually turn out OK.. all we have to do is rewrite the Flange module from scratch and then get Schmidt to let us use it in Release 2.0. I'm pretty sure I can do that.". Your coworkers will be fooled into thinking that they really *can* do those things, which they wouldn't have otherwise tried.

As noted in point #3, these things occasionally work, and as you hone your skills at tricking people into succeeding, you find yourself increasingly being sought after for CEO positions.

So there you have it, from the perspectives of both the motivational speaker, and the engineer. This stuff really works on other people and on ourselves, and it's the source of most of the "luck" we experience in our lifetimes.

So the only remaining barrier is: are you daring enough to begin this journey by turning the Optimism Gun on Yourself?

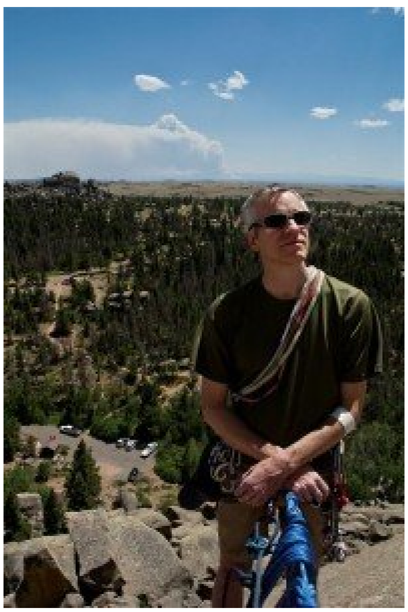
Guest Post: Why You'll Become Busier After Retirement

By Mr. Money Mustache

Sat, 06 Oct 2012 12:00:48 +0000



Darrow Kirkpatrick, still rockin' the rocks at 50

A few weeks ago, I met another early retiree while attending the financial blogger conference in Denver. I found I had a lot in common with this guy, from our shared former career to our optimism about life in general. Darrow Kirkpatrick retired at age 50 and told me he is finding life to be more fulfilling, and oddly at least as busy, as it was when he was employed.

Since he has a few years on me, I asked if he'd be willing to share his own perspective on what the transition has been like, and here's what he came up with, to share with you:

Why You'll Become Busier After Retirement

I reached financial independence and retired from my software engineering career at age 50 last year. My wife Caroline and I were hard-wired for frugality and saving, from the start. We avoided debt, lived in the same modest house for the past 16 years, minimized commuting — I worked from a home office, saved a third or more of my salary, and invested in stocks, bonds, and bicycles instead of fancy German vehicles.

Recently I was asked: "*Why* did you retire early?" That threw me. Doesn't *everybody* want financial freedom, so they can do exactly what they want in life? Even if you love your work, wouldn't it be nice to do it exactly as you please, a little or a lot, on your own schedule?

The first answer that jumped into my mind still seems the truest: even though I had a rewarding career and was passionate about my work at times, I simply liked other things better. Being outdoors, for example. I've always loved hiking, rock climbing, and mountain biking. I did some of the best climbs in the country with some of the best climbers of my generation. And I've ridden for days across Moab backcountry with my teenage son. Those were the peak experiences of my life.

So freedom was way more important to me than stuff or status. There was never any doubt in my mind that I would retire as soon as I was able. I wasn't going to be one of those fat cat business guys who kept working because he didn't have a life….

But the reality of early retirement has surprised me a bit. Of course, I never bought into the stereotypes: morning on the golf links, afternoon at the beach, evening in the hot tub. But I *did* expect to have more *space* in my life after I retired. A*ctually, I got busier.*

I *could* have more space, if I wanted. But, I don't want to. Once there are no longer any obstacles to pursuing your dreams, life changes. You take on new interests, and deepen old ones….

My biggest new interest is what you're seeing right here. I've always loved to write, so I learned some new tools, and began blogging about saving, investing, and retiring early. I found I had a lot to say about the transition to retirement, and that people were interested in reading about it.

Research and writing is the backbone of my new weekly routine. I still keep a fairly standard work schedule, but it's by choice now, and that *feels* totally different! Plus blogging lets me produce something creative that's valued by others — a product that I'm proud of every single day. Perhaps most importantly, it's plugged me into a network of savvy, interesting people who are making a difference in the world.

As part of writing a blog I continue to grow my understanding of personal finance, especially the issues around retirement income, and living off a distribution portfolio. I also spend time managing our own portfolio. I generally *do nothing* — I'm a passive index investor — but occasionally I need to take income or harvest gains to fund our living expenses.

But it's not all about personal finance now. Travel, always an interest, went into overdrive after I left my job. We spent a week on one of the less developed islands in the Bahamas, visiting old friends. It wasn't your typical beach resort vacation. Other than air fare, it was *free*, because we were living with locals. We hiked, caved, snorkeled, deep-sea fished, and boated around some of the most pristine and untraveled oceanfront scenery in the world. I generally hate beaches, but I fell in love with the place.

After the Bahamas, we spent a couple weeks climbing and mountain biking in New England and Acadia National Park, Maine. More recently we spent 6 weeks living cheaply out of our camper van, traveling in the Northeast and Rockies. We saw cool national parks like Dinosaur and Mesa Verde, scouted mid-sized Western cities for possible relocation, and climbed and mountain biked everywhere we could.

I've been a serious rock climber since my teens. But in later years my passion for climbing leveled off and other interests competed. After I retired, I started climbing regularly again, going to the climbing gym during the week and out to the rocks on weekends with friends. I updated my climbing rack and rope and started leading routes, something I hadn't done much in recent years. I don't climb as hard as I once did, but it's still fun!

On the home front, I've ramped up my cooking skills. While I was never a dysfunctional male in the kitchen, I wasn't perfectly at home there either. Now I do all the grocery shopping, and cook on the days that Caroline works. (She stayed at home for years while raising our son, and now — as a public school teacher — she's working a little longer so we can get retirement health benefits.) I can assemble a tasty, healthy meal from a menu of cheap possibilities without half thinking. It's not quite gourmet, but the true cook in the house seems satisfied.

Yes, you'll get busier once you're financially independent, but it isn't just about more activity. I try not to neglect the inner life either. I keep up a long-time reading interest in psychology and spirituality, and I've attended two retreats in the past year. Enlightenment seems as far off as ever, but today is good enough!

So I've been *plenty* busy in my "retirement." And I've heard the same from others who've become financially independent or retired early. Most of us who leave the modern 9-5 working world don't slip into a life of permanent leisure. Sure, we may take a little time off for rest and relaxation. But eventually life fills up with other productive activities.

There are several reasons why life becomes fuller even after so-called full-time work has ended:

1. All the projects, goals, and activities that were not possible when you were working, now become possible. If you're like most of us, you'll have a backlog of things you couldn't do before. But now your dreams are accessible. You have the time and resources to do what you want. You no longer have any excuses.
2. You break out of old patterns and are exposed to new people, places, and things. You move away from old work-related contacts and activities and enter into a new orbit. You gain new experiences and become more interesting to others. It's a self-reinforcing cycle.
3. Lastly you realize you are in a later stage of your life, and it won't last forever. I don't know if this is true for Mustachians who retire in their 30's. But in my 50's it is *crystal clear* that I'm not getting another shot. I'm currently blessed with the time, money, and freedom to do what I choose. So it's now or never!

Just because your full-time working years have ended, doesn't mean the rest of your days will be spent sleeping in late, sunning on the beach, or sitting in the park. Oh sure, you can do those things if you want. You *should* do those things. Just be forewarned, you'll probably be just as busy as you were at any other time in your life!

You can sleep when you're dead.

———-

Darrow Kirkpatrick is an author, software engineer, and investor who retired at age 50. He is an experienced rock climber and enthusiastic mountain biker, and writes regularly about saving, investing, and retiring at Can I Retire Yet? He is married to a schoolteacher and has one son — an amazing artist, engineer, and climber.

How to Go from Middle-Class to Kickass

By Mr. Money Mustache

Mon, 08 Oct 2012 19:28:55 +0000

73-year-old Jacinto Bonilla demonstrates what happens when you defy preconceived notions of your society. We define such independent thinking here as "kickass".

Dear Mr. Money Mustache,

Sure, I'm interested in becoming rich and maybe even having the option of early retirement. But nobody ever got rich by clipping coupons or skipping lattes. Shouldn't I concentrate on boosting my income?

sincerely,
A member of the Middle Class

A few days ago, I had the opportunity to go out to lunch with a dozen of my old coworkers from the high-tech company. It was quite a reunion, as I hadn't seen many of these gentlemen since September 2005 when I retired from my engineering job. Everybody seemed just like I remembered them. A few distinctive silver strands had sprouted from many of the heads and beards. Many of them had moved on to jobs at other local companies. But the most notable thing to me was that they all still had jobs.

Since the Mr. Money Mustache identity has become quite a fun little part of my life, I let some of them in on this secret of what I've been doing with my free time. But invariably, when you talk about early retirement with a person who gets by on a high middle-class income, they become baffled by how small things like riding a bike or understanding electricity consumption can make such a big difference. To a standard office worker, early retirement is what happens if you win a lottery, get a huge inheritance, or have ground-floor stock options in a company that makes it big.

I was baffled in the opposite way. I imagined what would have happened if I had *stayed* at that company for all these years. I would have earned an average of perhaps $110,000 per year in salary, as well as cashing in about $200,000 in stock option profits (I gave up quite a few in-the-money options upon departure, with strike prices set during the tech crash of the early 2000s). The company's generous benefits plan would have further saved me some out-of-pocket expenses, like the cash we paid to the hospital when our son was born.

All in all, I would have earned at least $1 million since then. And assuming Mrs. Money Mustache had kept working, she would have earned close to that amount as well. $2 million before tax, which would have gone straight to the bottom line and compounded since income from investments was already covering our expenses as of late 2005. In short, as we added that income to our existing savings, we would be ridiculously wealthy by this point.

But yet many of these coworkers, most of whom are older than me and were already working before my career, continued throughout my career, and are still doing it seven years and counting after my career, still somehow need to work, according to their own accounting. Some people in this situation are even living from paycheck to paycheck.

Quite accidentally, this group of coworkers has formed a nice control group for the study of Mustachianism. They have a wide variety of incomes, but all live in the same area, so the base cost of living and the tax rates are held constant. But one participant in the study tweaked only one variable while leaving the rest unchanged: **the spending rate.**

Somehow, Mr. Money Mustache maintained an outwardly-normal appearance among this peer group, showing up at work in acceptable clothing, achieving similar job performance, earning an average amount, and participating in all the usual social activities, yet adjusted his spending downwards enough to make a drastic difference in his financial outcome. How could it be?

The answer is as simple as the following table. Observe the monthly spending of a Typical Fancy Professional Worker versus a Future Early Retiree. To be fair, let's adjust the spending estimates to assume we are comparing two double-income families with two school-aged kids.

Category	**Middle Class**	**Kickass**	**Notes**
Mortgage Interest	1333	1000	MiddleClass: $400k house, Kickass: $300k
Property Taxes	200	150	

Category	Middle Class	Kickass	Notes
Car Payments	700	100	MiddleClass: 2 new cars and bikes every 5 years. Kickass: 1 used car every 10 years
Gas, Insurance, Stealership fees, Maintenance, registration, on the auto fleet	800	100	Kickass lives close to work and bikes
Home Maintenance, Renovations (appliances, roof replacements, pest exterminators, house insurance, painting, carpets, floors, plumbers, tree trimming, etc, etc). Plus water and trash service.	1000	450	Insourcing instead of Outsourcing
Miscellaneous "shopping" (stuff you buy at the mall, coffee shops, trinkets on vacation, $4.00 gourmet juices at the airport, voluntary ownership of multiple large animals, plus anything else not covered in this table!)	600	100	
Groceries	1000	400	Killing your $1000 Grocery Bill
Beer and Wine	200	50	Bota Boxes, drinking only a reasonable amount, and even home brewing

Category	Middle Class	Kickass	Notes
Restaurants and takeout/deliveries	600	50	Cooking great food at home.
Work Lunches	200	40	Kickass goes out every Friday, otherwise uses the Secret Food 'Stash
Gym Memberships	100	0	Barbells at Home, Rocky Balboa-style urban workouts
Housekeeper	400	0	
Lawn Service	100	0	Don't be a giant wuss! Put Muscle over Motor.
Ivy League Child Activities	800	100	Avoid Ivy-league preschool syndrome.
Toys and junk for kids (and other people's kids)	100	10	More creative and less consumerist gift giving

Category	Middle Class	Kickass	Notes
Clothes and Shoes	200	50	If you can't live on $600/year of clothes, I have a fist you need to meet
Outdoor and Sports Gear	100	20	Craigslist, plus realizing you do not need the same bike as Lance Armstrong
Haircuts, nails and waxing	80	5	A $1.00 pair of nail clippers and a $40 Universal Men's Grooming Device (aka hair trimmer).
Golf Membership	50	0	

Category	**Middle Class**	**Kickass**	**Notes**
Apple Products	100	10	Unless you earn a living as an iOS/Mac developer, you may own one Apple device per person.. period. Upgrade every five years.
Music and Movies	50	10	Netflix and Pandora. No, you may not buy DVD series of TV episodes!
Electricity	100	30	I'll show you mine if you show me yours
Heating/Cooling	100	50	Understand then Destroy your bill
Cell phones	150	50	Check out Google Fi ($20 per person, 15 for each additional)

Category	Middle Class	Kickass	Notes
Cable TV	100	0	Cut your cash-leaking umbilical cord
Landline Telephone	25	0	News flash: it's not 1998 any more, which is when I last had a land line phone.
Internet	50	50	
Books and Magazines	60	0	The Library will make you rich.
Vacations	500	200	Kickass still likes to travel, but avoids Tourist Traps
Prescription Medications and doctor visits for stress and overweight conditions	100	0	Allowance for healthier body due to more exercise, less restaurant food, and no stress about money or career
Monthly Total	**$9898**	**$3025**	
Annual Total	**$118776**	**$36,300**	
Annual Income (after tax)	**$140,000**	**$140,000**	

Category	Middle Class	Kickass	Notes
Annual Savings	$21,224	$103,700	
Savings Percentage	15.16%	74.07%	
Years to Retirement	43	7.5	

Wow! Just by switching from the typical high-income family's spending, to the slightly-less-ridiculous-yet-still-luxurious level of spending that comes as part of adopting a more Mustachian lifestyle, this typical family was able to reduce its annual spending by **over $82,000 per year.** Far from being stuck in a deprived lifestyle, the family on the right still gets to live in a $300,000 house, own a car and some bikes, eat great food, stay in shape, read great books and watch great movies, and in general lead a solidly kickass life.

And as you can see in the table, each of the areas of optimization aren't just wand-waving or imaginary – they are documented in more detail in the underlined links in the right column. It is essential for the typical high income reader to understand that I am *not making this shit up*. The "Middle Class" column represents realistic numbers gleaned from my own middle-to-high-income friends, peers and former coworkers. And the "Kickass" column is a mashup of the typical spending of my own family and those of other people trained in the art of more efficient living.

And all of this comes with a time-tested guarantee that you will gain, rather than lose, happiness as you implement the changes.

So now I can turn the question around: what do YOU think is more effective: optimizing your spending, or relentlessly working overtime and hoping for a "generous" $10,000-before-tax raise?

And is the effort of learning how to do it worth the reward of slicing **35.5 years from your mandatory working career** as shown in the table?

I think we're going to see a lot more ass-kicking in the months and years to come.

The Tyranny of Having a Real Job

By Mr. Money Mustache

Mon, 15 Oct 2012 12:00:00 +0000

A few weeks ago, a scary piece of paper came in the mail, addressed to Mrs. Money Mustache. It was an order that she report to the downtown Boulder courthouse for jury duty in early October.

The letter was careful to remind us that jury duty is an essential part of our justice system. Without randomly selected juries for court cases, we couldn't hold fair trials, and a fair justice system is essential to a free society, and blah blah blah. While we were in full agreement with the philosophy of jury duty, it didn't make the order to appear at 8:30am in a far-away city on a school morning any less damned inconvenient.

So on the appointed day, she zoomed off to the courthouse early in the morning, while little MM and I did our best to get him fed, clothed, and off to school on time without Mama's help. It was kind of fun, although we did forget his backpack, causing a stir in the morning lineup and requiring me to bike home and back to the school to deliver it.

Unfortunately, Mrs. MM had been selected for one of the biggest and most complex court cases in Boulder's recent history – the "Michael Clark Murder Trial" that is all over the local news these days. The lawyers had pulled in over 300 potential jurors and were painstakingly questioning all of them to narrow it down to the required fourteen. So it would take three days of sitting around in a courtroom to even find out if she would be on the jury. And if she did end up getting selected, she would be committed to **three weeks** of daily trips to Downtown Boulder. About 15 miles away, at the peak of rush hour each morning, resulting in a one-way trip of almost 40 minutes. Then a return trip home at 5:25 PM, through the peak of evening traffic, and another 40 minutes.

All told, she'd be spending up to 18 days in court if selected, with a total time commitment of 157 hours and a total travel distance of 540 miles. Since her time is worth at least $50 an hour, it means she'd be spending $7850 of her time on the case, as well as $270 in driving costs (or more likely a single $88 monthly bus pass). The daily stipend for jurors is $50 after the first three days, meaning she'd get only $750 of this back.

With the appropriate amount of self-mockery, we whined and commiserated about the incredible inconvenience and hardship that had befallen our family. Eighteen family breakfasts would have to be sacrificed. Her daily tradition of a smothering kiss battle with her son just before he and I bike out of the garage to head to school would be missed. She would still be out of town when school ended each day, so I would have to do the after-school pickup as well. Her personal time during the day would be sacrificed, and by the time she got home each night, her son would be almost ready for bed.

At the end of the third day, she came home with the great news that she had not been selected for the final jury. Freedom had come early! All of us were overjoyed. Although she only made the trip three times, our family life had been shaken to the core. Every routine had to change. We had been living the tragically inconvenient life of **a household with only one stay-at-home parent!**

But wait! The horror story continues. Mrs. Money Mustache was so unprepared for the demand of being in far-away Boulder at 8:30 in the morning that she *drove* the car to that city for the appointment. All three days! The quarter-tank of gas we had been nursing since returning from our last family vacation in early September was suddenly burned up and she had to *actually waste $35.00 of otherwise-useful money filling up the tank!* On the first day, she arrived unprepared for the rainy weather and with inadequate food for 9 hours in a courtroom, so she found herself outside at lunch, freezing cold and looking for food. At this point *she actually got back into her car and drove it to a restaurant in hopes of finding some lunch!!!*

Written with fewer italics and exclamation points, this could sound like an average American day at work. But to both of us, the story is horrifying and nothing similar has happened to either of us in the subsequent ten. The sloppy, desperate inefficiency of that first day in Boulder left us both with an odd combination of lighthearted laughing and filthy guilt. Yet, much like even the most mundane events that happen in the MMM family's lifestyle, it provided some extremely useful life lessons which we can reflect on for our own gain. And those lessons are:

1. Holy Shit, People with Real Jobs have unknowingly adapted to deal with mind-blowing inconvenience!

I mean come on – going away after a rushed breakfast, being forced to drive every day, and coming home only as the sun is going down? Every day? WHAT KIND OF LIFE IS THAT?? What do you do if you have kids??

And yet, millions of people do it every single day. These people, even as they whine that they cannot accomplish tiny things like riding a bike to the grocery store or living without cable TV, are actually doing something infinitely harder every day. They deserve to be congratulated, and reminded of their own accidental badassity.

But then they need to be punched in the face, in order to realize that if you can handle a full-time job, you can DEFINITELY and very easily handle every other suggestion that Mr. Money Mustache makes here on this blog. Compared to commuting daily to a 9-5 job, everything I suggest is a teeny tiny laughable mickey mouse effort.

You can read the whole blog, implement everything 100%, and be retired in 5-7 years. It's way easier than this habit you have now, of missing out on every day's joy of a leisurely breakfast that begins a yet another fantastic self-guided day.

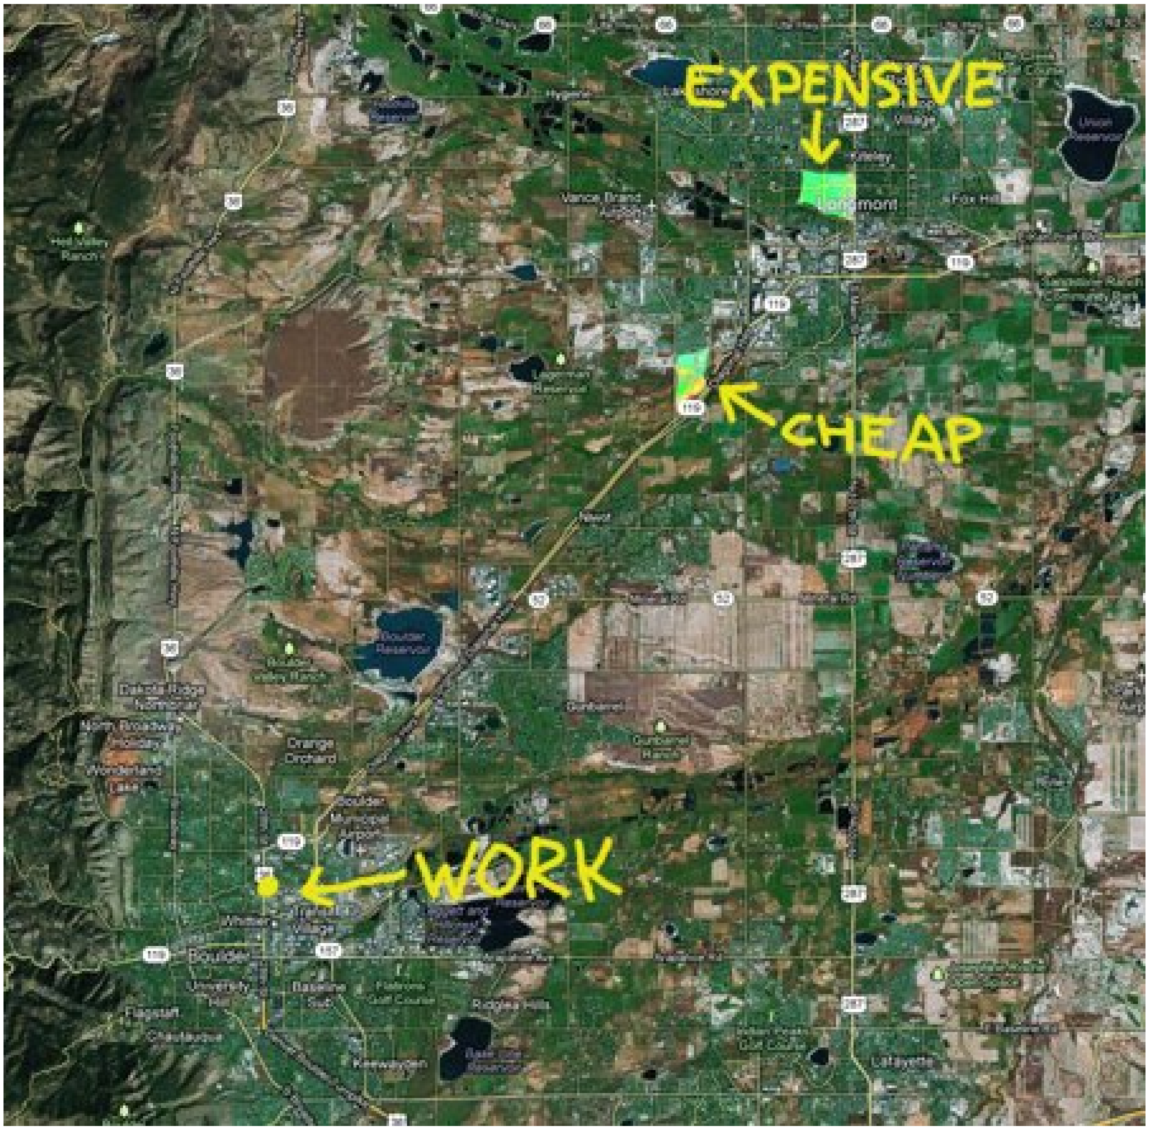
2. Most people handle the logistics of working in a perpetual "emergency last-minute survival mode". The key to getting ahead is to Optimize.

Mrs. Money Mustache set her alarm clock too late. She had to rush through breakfast and run out the door. There was no time to bike to the bus stop and take the express bus – she had to drive directly to the court house. She forgot to bring warm clothing. She forgot to pack a lunch. And we live *extremely far* from her temporary place of "work".

Everything was done in the most inconvenient, inefficient, and expensive way possible. This happens to be exactly how most people handle their work on a permanent basis.

If she really had a job in downtown Boulder, she would get a bus pass and learn when to set her alarm to allow a proper breakfast and a morning walk to the bus stop. She'd get her food situation organized so there would be no need to go out looking for food at lunch time. We'd start shopping for a place to live within a few miles of her new office. If housing was too expensive close to work, we'd consume *less housing* (i.e. a smaller apartment or rental house) to make up the difference.

Hell, even if we insisted on being crazy consumers and owning a large house in Longmont and commuting to Boulder (which thousands of people do), we could do much better than our current situation. Check this out:



Here we have a map of my town, Longmont, relative to Boulder. At the closest point, the cities are about 10 miles apart. But if you live in the downtown area where I live, you have to poke along for 12 minutes through traffic lights and other junk even to get to the Southwestern edge of town, where the road to Boulder begins. On top of that, the houses downtown are expensive, while you can get large, well-built modern houses down at the corner, still within easy biking distance of grocery stores and schools, at a much lower cost.

So why, *in Flying Feathers**, are so many of my neighbors commuting from downtown Longmont every day to work in Boulder, instead of moving at least slightly less ridiculously far away? They say it's because they love the ‘charm’ of the historic district and the ‘quality of life’ it offers. But I can’t help but suspect that their perception of Increased Quality of Life is only imagined, a delusion made possible by Decreased Quality of Math.

I mean, a downtown commuter is spending an extra 24 minutes per day, 23 times per month. That’s 9.2 hours, or about $460 per month at $50/hour. (And yes, your time IS worth $50/hour – more on that in an upcoming article). On top of that, they borrowed an extra $100,000 for their house. This is costing them at least $333 per month in interest and property taxes. Adding in the extra driving cost at a conservative $100/month, and these neighbors are wasting $893/month or **$154,489 every ten years** after compounding, *just to live another part of the same town*.

The key to all of this “getting ahead” business is to never settle for inefficiency, and always strive to optimize. You won’t be able to do it all on the first day, but over time you can make small tweaks, which make your day just a bit more efficient and stick to your lifestyle as useful habits. As these solidify, you’ll free up more time, money, and energy to continue making bigger changes. You’re getting stronger, and yet your life seems easier. Eventually you’ve got everything dialed down on autopilot, and yet your life is less stressful than it was when you were wrapped in a perpetual bubble of purchased convenience.

Some people say I am too extreme in my optimizations. “Waah waah, my quality of life will be affected if I don’t get to live near the fancy hipster pubs and coffee shops!”.

To them I say, “you’re the extreme one, for what has a bigger effect on your quality of life: spending every single day in a car and an office building just so your headlights can light up the trunks of big trees of the historic district as you drive home red-eyed and tired each night? Or being willing to make some changes NOW, to optimize your work situation, in exchange for a permanent life of freedom?”

In the end, we all get to make our own choices, which is a beautiful thing. Just remember that the choice of permanent full-time work so you can “buy more of the things you love” is costing you a lot more than you realize. And that every step you take towards optimizing your working life will cost you less than you think.

** that's my new swearword. Please consider it to be just as profane as "the fuck".*

Why Your Spare Time is Worth Way More than $25 per Hour

By Mr. Money Mustache

Thu, 18 Oct 2012 12:00:19 +0000

At the very center of Mustachianism Itself, lies the issue of **What to Do With Your Time**.

Time is one of your greatest allies in getting rich, but it is also a constant foe, since we all have a limited supply of it. So it makes sense that Mr. Money Mustache would spend some of *his* time, sharing some strategies that help *you* get the most of yours.

But sometimes, my bold and presumptuous advice will stir up a cloudy soup of questions and complaints from advanced and beginner readers alike:

"You can't count the 'cost' of the time I spend driving to work, because I have no way to get paid for those hours"
– person trying to defend a long car commute after reading The True Cost of Commuting

"I'm so busy at work, that I'm glad to pay someone else to mow my lawn, freeing up my weekends to do things I enjoy"
– person with a busy job and many outside-of-work hobbies.

"I'm an efficient IT consultant and I get paid a lot. Shouldn't I pay somebody else to paint my walls, since I earn more than they do?"
– an efficient IT consultant currently stuck with pink bedroom walls.

"If my time is really worth as much as Mr. Money Mustache says it is ($25, $50, or more per hour), should I really waste any of it doing things I don't enjoy?"
– person who wants Mr. Money Mustache's permission to skip out on all manual labor chores.

I can see the confusion, because at first glance, the Way of the Mustache might seem to have some contradictory rules. If a car commute is unacceptable because it wastes time, then surely we can justify buying free time in any other way possible too, right?

The answer lies in a hidden realm where numbers are sparse. The missing concept which ties together all of this is something called Fully Rounded Badassity. Let's express some of the principles to see how they can answer our questions.

1. Self Improvement Time Pays CEO-level Wages
If you eliminate your car commute and free up two hours per day, those hours go directly to your evenings, doubling the amount of time you have to get things done. If you invest this time in things like furthering your education (at school or with nonfiction books), or building up your own side business, refinancing your mortgage or getting better deals on insurance, or even just learning about stress and happiness, you are making permanent improvements to yourself or your financial situation that will last a lifetime. An hour spent shopping for insurance can save hundreds of dollars per year. Learning to spend money more efficiently (the subject of this blog), can allow you to cut your living expenses in half for life. Learning to eliminate prolonged mental stress can actually *save* your life. Far from being unpaid time, the free time you get outside of work is the most valuable time you have.

2. Demanding Physical Activities Pay Double Time
Some people complain about the time it takes to ride a bike to work, or to mow their own lawn or create a garden. But they don't realize that these things actually take no time at all, because they come with free exercise. One of my rules for life is that you need to average *at least an hour per day* of pretty hard physical exertion if you want to keep your life in balance. So if you aren't already getting this much active time, you can schedule in any number of these physical tasks and collect double pay: Once for the tax-free savings of the cash you no longer need to fork over to a lawn contractor, and a second time for the physical fitness dividend that you receive. Compare this with the strategy of a "time-saving" car commuter where you drain your money with every mile, sitting idly on your ass while the machine carries you around in a supremely unhealthy display of inefficiency.

3. If you don't like Maintaining a Luxury item, you Shouldn't Own it
Suppose you accept my exercise argument above, but you'd really prefer to get your exercise riding your $2400 carbon fiber road bike around in the foothills instead of cutting your own lawn. That's fair enough – but it means you shouldn't have a lawn. Just as you shouldn't have a motorboat if that requires you to hire a mechanic who services,

tows, and stores it for you, or a private jet with a pilot and hangar staff. Sure, you may enjoy these things, but until you're financially independent, **you simply can't yet afford to pay others to maintain your shit for you.**
If you un-velcro those Pampers from your brain, you will surely be able to find activities that you enjoy both producing and consuming. And those will be the activities you prioritize. Cooking and eating fine food is one example, as is maintaining and riding a bike, and even hosting and attending parties. There will be plenty of time for hiring others to produce luxuries for you, once you're not so damned poor.

4. Learning a Practical Physical Skill pays Quadruple Time
The Efficient IT consultant above had a sound argument based on the old 'law of comparative advantage' from the economics textbooks. But what he was missing is that painting a wall changes more than just the wall color. It counts towards your physical activity requirement. It teaches you a skill that is essential for any homeowner and will pay dividends for life. The end product is likely to be more satisfying, because it is a permanent symbol of your own accomplishment. AND it pays you a tax-free salary equal to what you'd otherwise have to pay the painter. Do-it-yourself activities are deceptively powerful, because you will quickly reach a skill level so high that you can complete a job for yourself with less time than you'd even spend hiring and supervising a contractor. The skill can also provide you with portable source of income at any future point in your life.

5. Insisting on Doing it Yourself Paces your Consumption
You've got a big to-do list, and only a limited amount of free time. Some house painting, a new garden, a bathroom renovation. You can hire them out right now, and have them done within a month. Or you can work your way through them individually, and get them done in the next year. Which option allows you to spend more of your salary?

By forcing yourself to proceed only as your own free time permits, you are producing a powerful vortex of joyful self discipline and wealth. Your spending is limited. Your costs for each project are drastically reduced. And your time-management skills are constantly honed, as you learn not to waste time on things like TV and websurfing, because the pepto-bismol-pink bedroom is a constant reminder that time management is important.

As explained in the old Classic "You Can't Cure Obesity with Bigger Pants", it is usually much more profitable to leave your problems around to stare you in the face, than to sweep them under the rug with a broom made of Franklins.

6. Remember Hedonic Adaptation – It's Hard to Believe, but Buying Shit Doesn't Make You Happier

This is one of the trickiest and most new-age concepts in Mustachianism. But it is one you must strive to understand, and make progress towards throughout your lifetime. The bottom line is that no matter what you buy, you'll soon adapt to the new level of luxury and be no happier than where you were before. This applies to anything – even paying someone to repaint your pepto bismol bedroom to a nicer color. Even owning a vacation home in the mountains in which you get to throw great parties every weekend.

The thing is, even I have trouble believing this. Taken to the extreme, you would logically conclude that it is best to own virtually nothing, and live in monk-like simplicity in a commune. Sometimes it just feels so right to buy something. The justifications are so rich and intellectual-sounding. The purchase will allow you to express your creativity, or stay in better shape, or spend more time with your friends and family. How can buying things possibly not make me happy?

To resolve the discrepancy, I think of the journey away from materialism as a lifelong challenge. I acknowledge that I do still suck, and I still have weaknesses. That's why I still have a very nice house filled with relatively fancy stuff. It's why after two years of fighting the urge, I broke down this week and bought this shiny "Ultrabook" laptop on which I'm now typing to you. The weakness causes me to crave new things, and it is my job to work against materialism, and towards other forms of happiness.

> The good news about all of this is you can simultaneously be sucking and succeeding. You don't have to achieve perfect freedom from materialism to become rich these days. You just need to wipe out enough of it to be able to save 50-75% of your income. That's relatively easy for households who make over $100,000 per year, because you just have to learn to be happy without some really high-end stuff that most people can't afford anyway, like Mercedes Benz products. Most of my own wealth comes from the fact that I've eliminated all desire for fancier cars, houses, trips, or motorboats. At much lower levels of income, it takes more practice, because you may need to be happy living without more common amenities, like any sort of car at all. But as soon as you realize that the situation is entirely in your control, the scale moves rapidly away from sucking and in the direction of success. And you might find your income creeping upwards towards those higher ranges as a byproduct of this success.

In the grand scheme of things, the way to get the maximum rate of pay for your time comes from a balance of factors. Improving yourself through education and learning skills will increase the market value of your services. But trading too much of your time for money will decrease the value of your money itself, since you'll be creating an unbalanced and unsatisfying life.

Thus, you will need to bust ass in a variety of areas, not just one, in order to maximize the value of your time. The $8.00 per hour Subway clerk needs to stay up late and study his math textbooks to get that business degree. But the $200 lawyer also needs to get her hands dirty mopping the floor and get some scratches while trimming the trees from the top of a ladder. Mr. Money Mustache still needs to set tiles and install new toilets into the homes of other people, even while he sets aside time to slave away over this backlit soft-touch keyboard in order to write to YOU. Even when he feels like just relaxing and watching movies instead. These balancing activities may or may not happen to generate income, but they are still essential parts of getting the maximum value from my time.

It's all a bit counter-intuitive at first, but just remember this: the way to earn the most from your time, is to consider the many ways you can extract value from each moment of your life.

The Riches of the Urban Harvest

By Mr. Money Mustache

Mon, 22 Oct 2012 01:33:28 +0000

Things have been a little quiet around this website in recent days, as Mr. Money Mustache has been lured away from the computer and out into the great outdoors for much of the past week.

The weather has been outrageously nice, and the magical healing properties of Mother Nature have been working their magic on everyone in the family. I granted myself the day off work* on Friday in order to bike to Boulder and meet an MMM reader for some hiking in the rocks at the edge of town. Next came "porch club", a rotating series of parties in my neighborhood where I generally use up my entire week's personal wine-drinking limit.

A screenshot from the action video

Today was a blur of leaves and sunshine, quite literally: Junior 'stash learned the joy of making his Dad rake up 4-foot-tall piles of dry leaves in the middle of the road so he could get a long run at them on his bike and smash through at top speed while I took videos.

Times like this weekend remind me of the riches that are hidden in plain view within in most of our immediate neighborhoods. When you hang out with the people who live nearby, you end up with some surprising benefits. Just a few examples from recent memory:

Millions of Peaches, Peaches for Free:

Years ago, I helped one of the friendly older ladies of my neighborhood with some home renovation advice. As a way of thanking me, she encouraged me to help myself to peaches from the enormous and productive peach tree in her back yard. I did, and they were great. But the experience opened my eyes to the fact that there are actually peach trees all over this town! So towards the end of every summer, I visit her tree and bike through the other alleys around here, picking huge bags of fresh peaches which nobody else picks. Most of this tasty fruit just falls to the ground and rots away!

Giving the Finger to the Apple Embargo

Is it just me, or is there something weird going on with the apple supply in this country? The prices are ridiculous – it's hard to pay less than $2 per pound or even $3.00 for organic apples at the grocery stores around here, even though it is apple season and we're supposed to be rolling in them. Luckily, friendly neighbors have come to the rescue again, as there are several towering 60-year-old trees in the 'hood, owned by people who I have helped out in the past. These folks cannot possibly use the approximately 1,000 pounds of apples the trees produce every second year, and guess who is happy to help out with the harvesting? I just hauled home a 20-pound bag this afternoon and, boy howdy**, are they the most delicious apples I've ever crunched.

The world's best lawnmower

If you've ever read Muscle over Motor, you know I'm a big fan of the olde-fashioned Reel Mower for cutting the grass. I've used a relatively junky one for years, but this year I scored a dramatic upgrade from a surprising place: the trash bin area in the alley behind yet another neighbor's house. This really good mower was being tossed simply because the low-quality steel handle had broken. After checking with the neighbor that they indeed did not want it, I brought it home, fired up the welder, and created a much stronger and more (cave)manly-looking handle for it. Since then, my mowing duties have been a breeze, and the mower itself draws many an envious eye from the other men on my street, who are still stuck sucking the fumes of their gasoline mowers and leaf blowers, the lawncare equivalent of a catheter and a bedpan.

Shortly after I renovated that mower, another nearby person disassembled an unwanted redwood deck, placing the still-good surface boards out by the street with a "free" sign. With several upcoming deck projects in my own plans, I loaded the 'stash into my van and stacked it in my lumber storage area for use in the near future. Approximate value: $300.

Sharing and Bartering as if Money had never been Invented:

I've had the privilege of doing renovation work on at least five of the houses on my little block alone, and I couldn't even tell you the number if you stretch the radius out a few more blocks. In several of these cases, the work has turned into a partnership or a trading of labor. "I'll help you build your deck, and you can help me paint my house next week", or "I'll lend you my cement mixer, and maybe you can lend me your garden tiller in the spring". The level of sharing has grown to be quite abundant, so now you see beer, wine, garden produce, honey, keys to houses, cars, trucks and remote cabins, children, and all sorts of advice and knowledge flowing between the households. All in an physical environment that can be traversed on foot within about five minutes, without the need to even put on your socks and shoes.

These bits of local trade enrich all the members of the community, and they are better than just the retail equivalent we could get down at the big-box stores, for several reasons. They come with trust and social connection – some of the greatest sources of happiness. They are immune to employment conditions or recession. And they let everyone produce value even in their free time outside of work, increasing their net income and savings rate without even realizing they are working.

It is little things like the stories above that make me happy to live in a city with many other people around, optimistic about the general prospects of our species as a whole, and happy to be retired so I have more time to take part in it all. For many of us working towards early retirement, getting in the habit of building connections in the neighborhood is like planting seeds for future wealth, and I recommend it highly!

Update: One reader pointed me to a new community website/iPhone App called inaturalist.org. (Free). You can take pictures of the natural highlights (including edible ones) of your own area, and they will be shared with other I Naturalists. This is just the type of effort I love to see people making, so I've installed the app on my own phone and will start adding some things around my own town. (It's new, so I may be the first Colorado entry!)

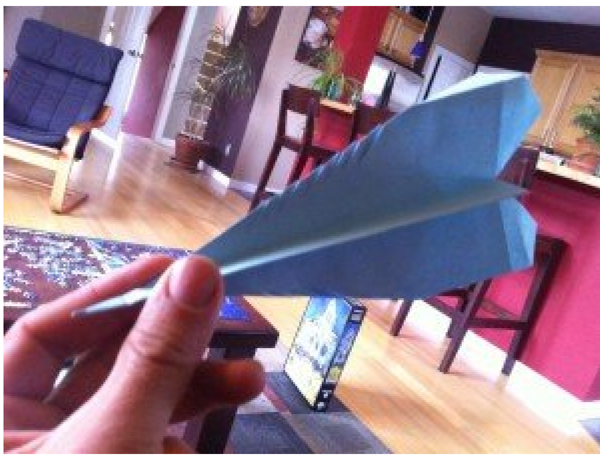
* haha, joke.

** amusing oldschool dialect lifted from Jim Collins

Frugal vs. Cheap

By Mr. Money Mustache

Wed, 24 Oct 2012 12:47:21 +0000



In the great transition from Clueless Consumer to Badass Mustachian, a person must first overcome a significant obstacle: the perception that Frugal, Cheap, Tightwad and various other words all mean the same thing, and that they are all nasty conditions that we should try to avoid.

So I've been meaning to lay down the law on this issue for some time. If you've read "Frugality is the New Fanciness", you know that being frugal just means displaying some skill and good judgement in the way you spend your money – and thus it is a mark of status far greater than conspicuous consumption. Only about 1/300th of the US population has read that particular article so far, but once they do, our country's desire to show off by making unnecessary purchases will be cured. No problem.

But that still leaves the issue of cheapness to be dealt with. What about Ebenezer Scrooge? What about the new reality TV series that a reader forwarded to me called "Extreme Cheapskates"?

Since you're probably too busy to watch the actual video, I'll give you the executive summary: In the linked episode, an unfortunate-looking man with really bad hair is profiled in his various money-saving adventures around town: scraping food off of the plates of other restaurant diners, asking for extra ketchup packets so he can refill his ketchup containers at home, and washing and reusing paper napkins, which he leaves hanging all over his kitchen.

Peppered throughout the show are voice-overs like "Roy estimates that over the last ten years, he has saved nearly $2000 by reusing paper towels"*.

Now, I'm not one of the standard douchebag consumers who derides any attempt to save money as pathetic. I've read plenty of misguided shit that internet commenters have made about my own lifestyle, and it is clear that the complainers do not get it. So I suspect that Roy is actually having a pretty good time with his little tricks, and whether his math is right or not, he's doing pretty well overall.

But I would also guess that anyone who follows his lead might suffer severe social stigma for being "cheap", and for many of us that is not an acceptable outcome.

Being cheap works perfectly well for many people. If you're older, safely protected from the dating world from within the confines of a long-term relationship, and employed in a field where the cheapness doesn't hold you back, you're set. As your age and wealth grows, you may naturally give less of a shit about any irrational preferences of younger society.

But I've made the entire journey from teenager to greybeard with a strong appreciation for the value of money, but an even stronger desire to be part of society, to have friends, girlfriends, fancy jobs, and some social status. For better or for worse, I like being part of a social scene, and while I have no problem with doing things my own way, I try not to let my quirky preferences get in the way of these lifestyle goals.

Imagine a high-school or university student who is in a rich city and looking for love. In this situation, squeezing out ketchup packets, wearing stained green 1980s sweatpants from a thrift shop, or refusing to go out on the town with friends can seriously cramp your chances of success.

Or perhaps you're a young professional worker in the financial industry. If your boss and coworkers wear crisply ironed blue shirts and suit jackets around the 54th floor office, while you insist on freebie conference t-shirts and Wal-mart jeans, your cheapness is not helping you get ahead.

Even in married life, canvassing the tables of the other restaurant diners to ask if you can take home their leftovers while your wife covers her eyes in shame, is an exercise in penny-wise and pound-foolish behavior.

But yet, there are other ways where frugality (rather than *cheapness)* is a win/win situation: the student who walks to campus instead of driving, or the finance professional who foregoes an expensive wine-collecting hobby, or the married Mustachian who lifts weights in his basement instead of joining the $200 per month health club downtown can save money with frugality without suffering any downside.

What makes the difference between frugal and cheap? Mr. Money Mustache has some guidelines to help you walk the fine line.

It's (almost) all in your Mind:

Many of the worst spending addicts are buying things because of purely imaginary fantasies about the social status they will get. A specific brand of $400 purse or a Mercedes GL550. At this level, they are well beyond the lower threshold of what is required to fit in socially, and may even be popping out of the other end of normalcy, where people will wonder why the hell they buy such expensive stuff. I know several CEOs of multimillion dollar companies who are perfectly content to be seen in a Honda CR-V, and plenty of fashionable Los-Angelesy people who do not follow fashion brands at all. The key is that these people still understand social norms, but they are confident about not needing to stand out at the high end of them. And that confidence earns them far more respect than expensive products could ever attract.

Frugal does not mean Owning Mostly Crap:

A cheap person may live for decades with the sorriest old fridge he could find on Craigslist. A frugal person might have a relatively new and even rather *luxurious* fridge, and yet spend less money owning and operating it. Similarly, the frugal person might own a more expensive bike or pair of shoes. The key to this counter-intuitive trick is to factor in things like energy consumption, longevity, time saved by owning a more effective product, and even life satisfaction derived from having a few very good things that you use every day. Frugal people still get to own and enjoy top-quality assets, tools, and investments.

Don't spend excessively on yourself, but don't be afraid to spend on others:

When you're on a first date or out with friends, it may be perfectly appropriate to pick up the tab, spontaneously buy pitchers of beer, and otherwise burn off a week's worth of grocery money in four hours. And do it without worrying a bit, because you know you can afford it in the long run. If you do it right, you're buying experiences you'll remember for a lifetime and building friendships of similar longevity.

The key is in what you do *between* these lifetime experiences. If you attempt to re-create them in the same way every weekend, you're just building your career as an alcoholic. If you also pamper yourself with iPads, massages, and salon haircuts on the off days, you're just creating a person who needs Pampers. So you can selectively spend to capture those fleeting Good Times… but live more like a spartan warrior when nobody's around.

Make fun of Yourself, but don't Embarrass Others:

On a typical day, I can be seen biking around town in a paint-splattered lumberjack shirt, patched jeans, and work boots, pulling a bike trailer full of groceries and/or power tools. To me, it feels more showy than a Mercedes, because I'm out riding in the sun while everyone else works. But the Mercedes drivers passing me may think I'm an unemployed hooligan. Occasionally, I'll show up at the school to meet my son in this condition, and I find the other parents are dressed in their office worker or doctor or teacher clothing. Nobody seems to care at all, and I get a huge running hug from the boy when I arrive.

On the other hand, if I had a teenage daughter giving the valedictorian speech at the high school, I might not show up in my painting clothes. And at a restaurant, I never ask strangers for their leftovers, no matter how yummy they might look. It's because these actions would embarrass others, and so my frugality would be inflicting pain on others even if I enjoyed it myself. It would become cheapness.

Use Social Responsibility as a Guide:

If you forego German SUV ownership, you're not hurting society. In fact, you're probably helping by eliminating a bunch of mining and fossil-fuel burning. On the other hand, if you dump your trash in the forest to avoid paying the city's garbage fees, or haggle endlessly with the manager at the big-box store to get things for free, you're not helping anyone but yourself. Canceling TV service and taking up the more productive hobby of reading library books is Frugal. Saving the same amount of money by voting down property tax funding for your local school system is Cheap.

Physical fitness is a nice Substitute for style:

As a close companion to the first point about mental conditioning, comes the issue of your physical form. If you're already so confident about yourself that you don't care what the outside world thinks, good for you – you can skip this step. But for the rest of us who could benefit from a reassuring ally in life, solid physical fitness is a nice one.

Although it is a form of discrimination, fit people are considered more attractive in our culture, and attractive people get hugely unfair benefits in all areas of life. Dating, business hiring and promotion, and even presidential elections are strongly influenced not just by how competent people are, but also on the purely physical impression they make. You can totally game this system just by giving yourself a generally athletic form. The boost in self-confidence combined with the actual change in how other people view you can create a virtuous circle. You will earn more money, even as you can confidently get away with more Frugal tricks without taking shit from your friends and coworkers. And all this shallow appearance stuff is of course just the icing on the cake of living a longer and more energetic life in general!

Artsy-ness Makes Cheap Stuff Cool:

My mom is an artist and my younger brother is an indie rock musician. They're creative and eccentric and great, but they don't make a lot of money with that talent. So both of them have scraped by for many years on incomes that most people would consider inadequate. But when you visit them, there is not a sense of cheap deprivation in their homes… instead there is just really interesting coolness. Bizarre found objects get adopted and shaped into stylish pieces of artwork, unsightly nooks in an old brick wall get painted and become chic shelves you wish you had at home, and scribbly drawings and tour posters somehow work just right for the audience. I've seen my brother, wearing old thrift store discards and 1980s pinstriped suit pants, rock a packed venue of hipsters until tears streamed from their eyes. The lesson is that artistic expression is an excellent substitute for using money to be appreciated.

Choose Wise Friends, not Vacuous Consumer Drones:

Although these tips are designed to keep you on the good side of society as a whole, you can also fine-tune the crowd with whom you choose to hang. There are still some circles of people caught up hopelessly in consumer lifestyles – those who jet out for trips to the shopping mall between episodes of reality TV shows. But luckily, there are plenty of people who are not like this, and they want to be your friends too. The battle to maintain a better lifestyle will be much easier if you pick the right crowd.

So let's draw a line between frugal and cheap. You can be as badass as you want about frugality, and yet you can still shed society's scornful comments about what it means to be cheap, all while being confident that you are doing the Right Thing.

**which sounds like bad math to me. Would you really spend almost $200/year on paper towels? I probably spend less than $10.00, and that* *includes a few bucks for washing and replacing luxurious dish towels and cloth napkins as needed*.

A Visit from a Mustachian Musician

By Mr. Money Mustache

Sat, 27 Oct 2012 12:00:13 +0000

built his own house in the Pacific Northwest mortgage-free for $30,000, and now his family lives there happily.

But there was more to come. It turns out this Mustachian is also part of a high energy Ska band called Locust Street Taxi, and they had a very relevant video on the topic of "Stuff": http://www.youtube.com/watch?v=G-PvDlwU550

When he found out that I liked his video, he also sent me this unsolicited story about balancing the exciting life of a musician with the constraints of limited funds and a family at home. It rang true to me, as I've watched my own brother tour the world on a shoestring budget as well – the hard times of a life touring are excellent practice for running a good financial ship back at home.

How to be a Mustachian Musician

by Franco

Being in a working band could be considered a very anti-mustachian profession. Commuting six-hours from home, one-way, to work a job for one hundred and twenty minutes and then driving six hours back home, bleary-eyed, through the wee hours of the morning while drinking all sorts of strange liquids to help one stay awake sounds like the antithesis of efficiency and the definition of anti-Mustachian insanity. And it is. But some people cannot be persuaded not to do it by any number of wise and loving old people. The reason is that they love it and they also happen to own optimism guns (Triple M brand.) This is where the hint of Mustachianness in the life of a working musician comes in.

The optimism gun turns the six-hour hellish commute into a six-hour super fun road-trip with three of your best friends to perform music that you wrote because you enjoy writing music for people who love and adore you – and coming home with more money than you had when you left. After using the optimism gun it sounds like a most Mustachian achievment. Getting paid to play music is pretty cool. My band loves playing music so much that even after hundreds of gigs, we still have a hard time saying no to any gig that promises a beer and a meal. Rock out and get free beer at the same time? Count us in! We also know that the amount of money we make at a gig doesn't really affect the amount of fun we have, but it does affect our ability to justify the time involved to our wives. We have, therefore, learned to say no from time to time when a gig doesn't make financial sense.

To tell the truth, even though we still get a kick out of being paid to do something we love, my band has indeed experienced the "six-hour hellish commute" version of gigging as well as the "six-hour super fun road trip" version- and sometimes both at once. But there some ways to make musical work more Mustachian rather than less. We don't always succeed in following them, but they are there.

One of those ways is to not do it full-time. My band normally performs about 50 shows per year and not all of them are six hours from home. This makes the "fun road-trip to play music with friends and get paid at the same time" view almost reasonable. If we were playing a hundred and fifty gigs a year like some working bands, I don't think we could consider them all to be fun road trips- at least the two of us in the band who have kids couldn't. The two single dudes would love it.

Because we only play fifty or so gigs a year, with many of them bunched together, I have time for other side jobs and productive activities like building my own house, chopping my own firewood, helping my wife coach soccer and chasing my own children around the yard. My band mates have other jobs too, such as going to college, working in restaurants and doing freelance writing. Right now, our fifty gigs don't pay them enough to live off of for the whole year – but that is the goal, and we are getting closer.

I think our band is pretty lean and efficient. Often, relatives and friends have a hard time believing that we come out ahead in our musical pursuits. We often get asked if we break even, but we do a heck of a lot better than break even.

Here are some of my personal favorite ways we save money:

1. Staying with friends and fans when on the road instead of in hotels. This is obvious, but so much more fun and interesting than staying in hotels. Homemade food is better, the conversation is often enlightening and the good feeling from being taken care of by people who like you is hard to beat.

2. When we do stay in hotels reserving just one room, not two. This means sharing beds with trombone players and drummers, but saving a lot of money. It also turns out to be way more fun (even though none of us are romantic partners.)

3. When we do stay in hotels, never throwing furniture out the window and no matter how late we got in the night before, always, always getting up in time for free continental breakfast. (Though, recently we checked in so late – 7am – that we couldn't decide whether to have breakfast before bed or after.)

4. Buying food using my "most calories per dollar" rule. Not everyone in the band espouses this method, but I have used it to successfully fuel my

body on the road for half the amount that an average guitar player might spend.

5. Writing songs that aren't too depressing or pretentious. This has saved us untold amounts of money in the form of gigs we would not have gotten and fans we would not have made if we wrote those kinds of songs.

6. Recording an entire album in a day. (Big-time bands can afford to spend months in the studio to make mediocre albums. Someone should tell those artists that they could make albums just as mediocre in a single day. In fact, I bet in some cases that this would make their albums better.)

7. Not lugging around stacks of amps and speakers that are thirty sizes too big for the venues we perform in. Small is good for gas mileage, especially in that it makes it possible to fit the whole band into one vehicle. Also, sound engineers thank us all the time for being reasonable with our stage volume.

8. Having a trombone player in the band make a really fun clay-mation music video with $100 worth of clay and materials, a web cam, Windows Movie Maker and lots of tedious work. (Girlfried just getting home from work: "How was your day, honey?" Trombone player: "Great. I got 8 seconds done.")

Besides these, there are some things that I have learned on this blog that I intend to try, such as squeezing the band into a smaller vehicle that gets better mileage. We fit the whole band and all of our gear into a GMC Safari now, and I used to think that was pretty impressive of us. But MMM has inspired me to do much better than that. I am imagining a 35mpg hatchback or station wagon with a tremendous storage bin welded to the back bumper. Perhaps I could get a collapsable guitar to save space.

(MMM Comment – I think a little closed-top cargo trailer would be perfect, and they're light enough to tow with a small car!)

Also, in the past we have always stopped for gas whenever the gas gauge read low. How simple of us. Our drummer now has a smart phone which he is very pleased with. I think he would love to have the assignment of finding good deals on fuel while we are cruising down the interstate.

Above all, I think the most valuable asset any band can have is a good attitude. That may sound trite, but it has been true for us. A lot of musicians who are very talented have bad attitudes. “People just don’t support music any more,” they like to say. That hasn’t been our experience. Just look at all the people who have fed us good food and drink and have let us sleep in their houses.

Thanks very much for sharing the story Franco, and have a great weekend all!

First Understand, Then Destroy Stress

By Mr. Money Mustache

Mon, 29 Oct 2012 12:00:15 +0000

***"The only thing we have to fear, is fear itself"***
– F. D. Roosevelt, 1932

"Don't Worry, Be Happy"
– B. McFerrin, 1988

Most of us know enough not to disagree openly with unassailable pillars of wisdom like those above. But somehow, we also have a hell of a time putting them into practice in real life. And yet if we *could* just get those simple things to click in our heads, we could improve almost every aspect of our lives – permanently.

I'm no exception – while I grew up generally happy, I was prone to worry and fear over some pretty irrational things. I worried when I didn't get good enough marks on important tests in school. I fretted after the end of each of my silly high school romances. Even major traffic injustices were enough to get the odd windshield-cracking batch of profanity out of me. Luckily I ended up in the relatively low-stress career of software engineering, otherwise work might have gotten to me too.

I was also fortunate to have the stress-relieving factors of a nice bicycle commute to and from work each day, and a peaceful social life with no relationship drama at home. So overall, stress was not a big factor in life.
